On Aug. 24, 1939, provisions of the non-aggression pact were made public. The essential elements of the pact include: an agreement covering a period of 10 years, that each country will refrain from acts of aggression against the other, either alone or in combination with other nations; that they will consult regarding common interests; and that they will adjust by peaceful means any conflicts which might arise between them. Whether any other provisions of the pact exist is unknown.

The announcement of this agreement caused widespread confusion, particularly in Western Europe, and generally throughout the world. Conservatives had expected that Nazism was a defence and a bulwark against the spreading of Communism. Left-wing groups everywhere had believed that the U.S.S.R. would never withdraw its opposition to Nazism. The separate ideologies of these two totalitarian states had convinced the majority that the aims of each lay in opposite directions. For 20 years observers had claimed that sharp lines of distinction separated the party principles of the Nazi and the Communist. Since 1920, Adolf Hitler had informed his party followers that Communism was the enemy of the German State. In his book, *Mein Kampf*, he stated that an agreement between Russia and Germany would mean the end of his country. Since 1933 he had exhorted the German people to join in a crusade against the "criminals" of Moscow. Germans had fought in Spain against the Russians in a campaign to support Fascism and prevent the spread of Communism. Germany had concluded with Italy and Japan an anti-communist protocol. These, and many other factors, supported the view widely adopted that Germany and Russia would never make common cause or reach diplomatic agreement.

Disregarding the consideration of political philosophy, and speculative examinations of party ideologies, there were many practical reasons which led to the conclusion of the Soviet-German pact. In the first place, each was opposed to the policies of western democracy. Russia, in the early stages of industrial organization, required the technical experience available in Germany which could make full use of the vast supplies of man-power and raw material available in the Soviet Union. The developments of Russian raw materials might result in finding a large market in the highly industrialized German State. For the practical consideration of economic interdependence the two countries had a common interest. It has always been evident that officers of the German Army found it convenient to train in Russia when the Reichswehr was still under restrictions of the Treaty of Versailles. The disarmament provisions of that treaty long ago led to practical considerations for the construction of armament factories in Russia. Germany has always considered that in a major war security on the East flank would be essential to gain victory in the West. For both economic and military reasons, Germany and

Russia could find common agreement. In the light of the developments of the "white war" during the early months of 1939, it appears today that the Soviet leaders discounted any help which had been promised to them by France and Britain in the event of a German attack on Russia. It is possible that they considered the Red Army to be no match for the highly efficient German forces. A non-aggression pact with Germany would at least postpone any attack by Germany and divert German expansion away from Russia in the direction of the Western powers. The historians will speculate on the real basis for rapprochement between Germany and Russia. The similarity between their common opposition to the principles of democracy, the joint needs in the fields of economic and military security, are not alone the only support to be found for their agreement. Each held a deep resentment against the provisions of the Treaty of Versailles. Each had a common hostility to the British Empire which limits their individual aspirations in many parts of the world, and, if destroyed, would provide considerable profits for Germany and Russia.

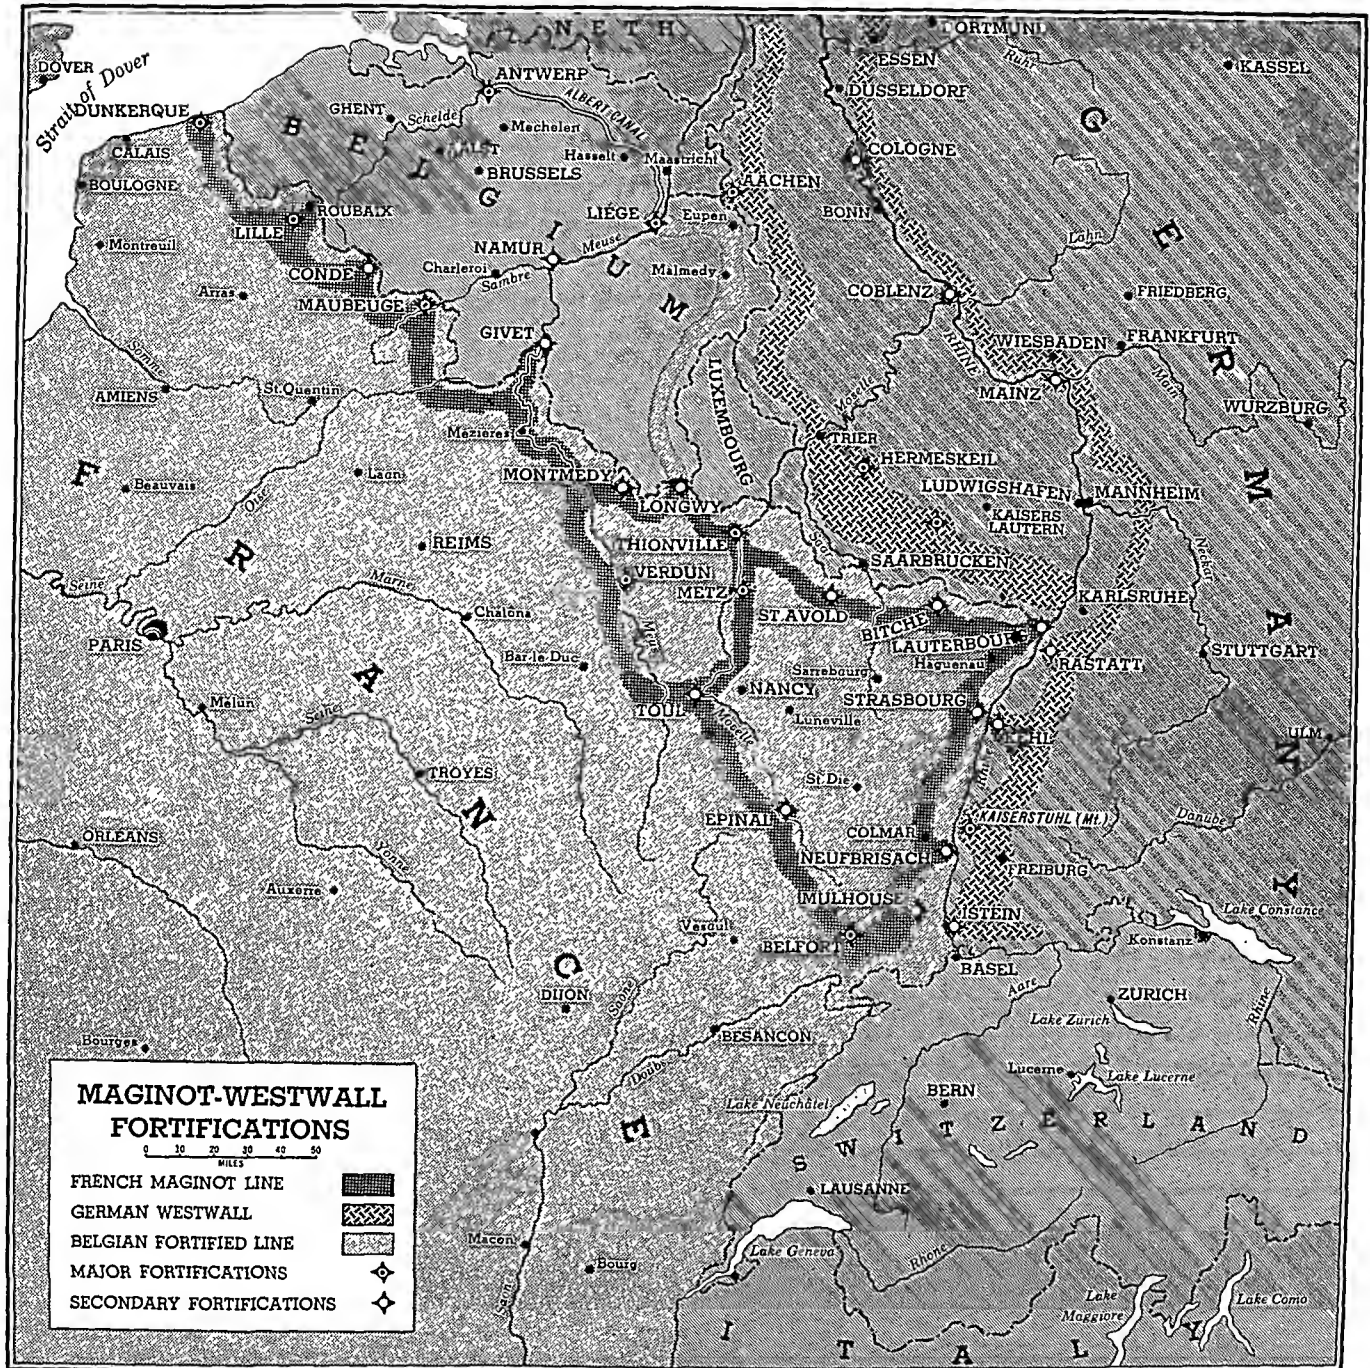

In the considerations which led to the opening of the combat phase of the European war of 1939, the conclusion of the Soviet-German non-aggression pact appears to have been the final diplomatic action which immediately preceded the conflict.

Summation.—The real causes of any war remain obscure during the combat phase, appear in bewildering dress immediately following the war, and provide endless speculation until the approach of the next war. Moral judgments appear suspended during conflict. Prompt and continuous examination of facts suggest that this suspension might not run the risk of becoming extinction. An examination of the preceding account indicates that the following were contributory causes to the 1939 European war:

- (1) The acceptance by England and France of German demands, based upon racialism and the theory of self-determination for German minorities. (The policy of appeasement.)
- (2) The drift away from the post-war system of collective security and the substitution of direct negotiation leading to agreements outside the provisions of post-war treaties. (The Munich Agreement.)
- (3) The development of a German policy of imperialism, based upon territorial expansion. (The march to Prague.)
- (4) The reversal of the policy of appeasement and the creation of a non-aggression front, coupled with rearmament.
- (5) The failure of non-aggression and the failure of the major powers to accept peaceful negotiation.

Germany.—Organization for National Defence.—The organization for national defence in Germany is controlled by a supreme command and co-ordinated by a defence officer. The Reichsfuehrer Adolf Hitler is the supreme commander of all armed forces (*Wehrmacht*) of the German nation. He has a principal assistant, Colonel General Keitel, for the supreme command, and exercises control through the separate commanders of the army (*Heer*), the navy (*Kriegsmarine*) and the air force (*Luftwaffe*). The defence office operates under the supreme commander and is responsible for co-ordination of all policies common to the three services. Industrial mobilization and counter-espionage are functions of this department.

The German State is divided into several territorial areas, each consisting of complete facilities for mobilization, replacement and general military administration. The organized units within territorial areas are assigned to one of the six army groups which cover the nation. The 1st Army group faces Poland (or Russia). The 2nd Army group faces Holland, Belgium, France and Switzerland. The 3rd Army group faces south towards the former provinces of Czecho-Slovakia. The 4th Army group faces north towards the seacoast. The 5th Army group is in Austria and faces Italy. The 6th Army group has no territorial assignment and exercises control of training for mechanized and anti-mechanized units. The National Defence Law of 1938 renders all male citizens liable for military services between the ages of 19 and 45 years. In war-time these provisions may be extended beyond the 45-year limit, and further, both men and women may be obligated for service other than military on order of the minister of war. In effect, all male and female citizens may be called for national service, military or otherwise, under this total mobilization plan.

C. S. Hammond & Co., N. Y.

Army.—The following table is an estimate of the strength of the organized forces of the various components. These figures include Austrian and Sudeten reserves.

Regular Army (active)	1,000,000	Political Organizations (semi-military)	
Reserves (trained)	1,250,000	S.S. (Black Shirts)	100,000
Landwehrs (trained)	1,500,000	S.A. (Brown Shirts)	1,000,000
Reserves (partially trained)	2,500,000	Motor Corps	300,000
		Technical Emergency Help Corps	150,000
		Motor Service Corps	250,000
		TOTAL—Military and semi-military	8,050,000

In peace-time, the army consisted of from 55-65 divisions. In war-time this total might expand to 160 or more divisions of all types.

Navy.—The following is an estimate of the strength of the organized forces and total ships as of Sept. 1, 1939: Commissioned, 4,000; Enlisted, 60,000; total, 64,000. Adequate naval reserves are available as required for new units when placed in commission.

Ships (all categories including battleships, cruisers, destroyers, aircraft carriers and submarines, but excluding torpedo boats, escort vessels, tenders, mine sweepers and similar assorted small craft): in commission, 128, tonnage, 275,000; building, 65, tonnage, 240,000.

Air forces which operate with naval forces are part of the unified air force. There is no separate air arm under naval control.

Air Force.—The following table is an estimate of the strength of the organized forces and totals of aircraft in the various components as of Sept. 1, 1939:

	Personnel	Active	Reserve	Total
Commissioned		6,000	5,000	11,000
Pilots		3,000	2,000	5,000
All others				
TOTAL		9,000	7,000	16,000
Flying Cadets		2,500		2,500
Enlisted				
Pilots		7,000	5,000	12,000
Mechanics		7,000	1,000	8,000
All others		150,000	40,000	190,000
Anti-aircraft				
Commissioned		6,000		6,000
Enlisted		120,000		120,000
Air Signal Troops				
Commissioned		1,500		1,500
Enlisted		30,000		30,000
TOTALS		333,000	53,000	386,000

Planes	Totals	Planes	Totals
Pursuit	2,700	Training	3,500
Fighter	600	Transport and Service	2,000
Bombardment	6,000		
Observation	2,000	TOTAL (including reserves)	16,800

The air forces include approximately 370 active squadrons, and it is estimated that over 150 reserve squadrons are available. A squadron consists of 12 planes (9 active, 3 reserve), 5 commissioned pilots, 6 enlisted pilots and 100-130 enlisted men. Production rate on Sept. 1, 1939 in the aircraft industry was 1,500 planes per month.

Theory of Combat.—All armed forces in Germany are combined in pursuit of a policy of swift destruction of enemy opposition. The theory of combat for the army appears to be the hammer blow or lightning stroke involving a crushing attack launched with an intense effort designed to overcome all opposition. The naval forces, due to lack of numbers and geographical limitations, adopt the theory of air, surface and undersea attack against enemy naval and merchant craft. The air forces are modern and as yet remain an unknown factor insofar as a major air engagement is concerned.

It appears that the theory of combat for air would theoretically be the lightning blow delivered with maximum strength, with carefully selected objectives. Great attention has been paid, as the Polish campaign and the operations in the North sea testify, to the co-ordination of the work of air and surface forces, both by land and by sea.

Strategical Considerations.—Germany entered the war as an absolute dictatorship, vigorously pursuing a rigid nationalistic policy, seeking to obtain a commanding position militarily, economically and politically in control of Europe. Internally, all effective organized opposition to the Government had been suppressed. Freedom of political and diplomatic action had been gained by nullification of post-war treaty agreements. Concentrated efforts had resulted in approaching completion of a re-militarization program, including the creation of a formidable air force second to none. Economically, the nation had mobilized industry and labour on a war basis, subject to centralized Government control. This industrial mobilization equalled or excelled the expansion of the military program. Geographically, the nation's military position was strengthened by the acquisition of Austria and the reduction of the Czech salient. The defences in the west had been strengthened and extended from Switzerland to the Dutch border.

Defences in the east were less complicated but considered adequate.

The North sea and the Baltic approaches were considered protected by the fleet and the north coast was equipped with air and coastal defences.

Italy, Yugoslavia and Hungary were on friendly terms with Germany and with the Alps as a barrier, the southern borders appeared secure.

On land and sea and in the air Germany appeared strong and moving in the direction of greater strength. The political differences with other world powers and the unpredictability of the course of the absolute ruler, Adolf Hitler, made the national strategy a question of opportunism. Few predicted that a Soviet-German non-aggression pact would immediately precede the campaign in Poland.

Few believed that the lightning military success in Poland would follow immediately. Few anticipated the overtures of peace to England and France.

The basic consideration at the close of 1939 appeared to be that for Germany the strategy of opportunism dictated the future conduct of national events.

Great Britain.—*Organization for National Defence.*—The supreme command of all armed forces is vested in the King-Emperor. The military forces consist of the army, the Royal Navy and the Royal Air Force. Each of these organizations is di-

rected by an independent ministry and these three ministries are co-ordinated through the committee of imperial defence.

The war office (army), the air ministry (Royal Air Force), the admiralty (Royal Navy), are represented by their respective ministers and, with the minister for co-ordination of defence, join the prime minister, the chancellor of the exchequer and other cabinet officials in the deliberations of the committee of imperial defence, in which are also included the chiefs of staff of the three fighting services.

The defence of the self-governing Dominions is a Dominion responsibility. That of India is, at least in part, controlled by the Indian Government, in co-operation with the war office, air ministry, etc.

The colonial office controls certain armed forces in the colonies (e.g., King's African Rifles, Royal West African Frontier Force, etc.).

The ministers for the Dominions, the colonies and for India are included in the committee of imperial defence.

Army:	Active	Reserve	Total
Regular Army			
Commissioned	12,700	34,500	47,200
Enlisted	195,000	350,000	545,000
	207,700	384,500	592,200

These figures include British Army in India and the Colonial and Indian troops. Includes men of legal age and in categories as shown. It is estimated that additional manpower can be secured as follows: trained, 150,000; untrained, 4,000,000; a total of 4,742,200.

Navy:	Active	Reserve	Total
Personnel			
Commissioned	11,400	4,800	16,200
Enlisted	130,000	54,000	184,000
	141,400	58,800	200,200

Ships: commissioned, 312, tonnage, 1,225,000; building, 90, tonnage, 700,000. The naval air arm includes 10 squadrons at home bases, and 15 squadrons at overseas bases, a total of 25 squadrons or 375 ships.

Air Forces:	Active	Reserve	Total
Personnel (Excluding India)			
Commissioned	6,300	2,200	8,500
Enlisted	66,000	13,500	79,500
	72,300	15,700	88,000
Air Force in India			
Commissioned	300		300
Enlisted	2,000		2,000
	74,600	15,700	90,300

Planes: (fleet air are not indicated) (Sept. 1, 1939): bombers, 1,867; fighters, 1,101; observation, 574; training, 400; transport and service, 75; a total of 4,017. Production rate peace-time monthly basis: (Sept. 1, 1939) 600; (Dec. 31, 1939) 1,000. The air force includes approximately 210 active squadrons of which 50 are based in possessions.

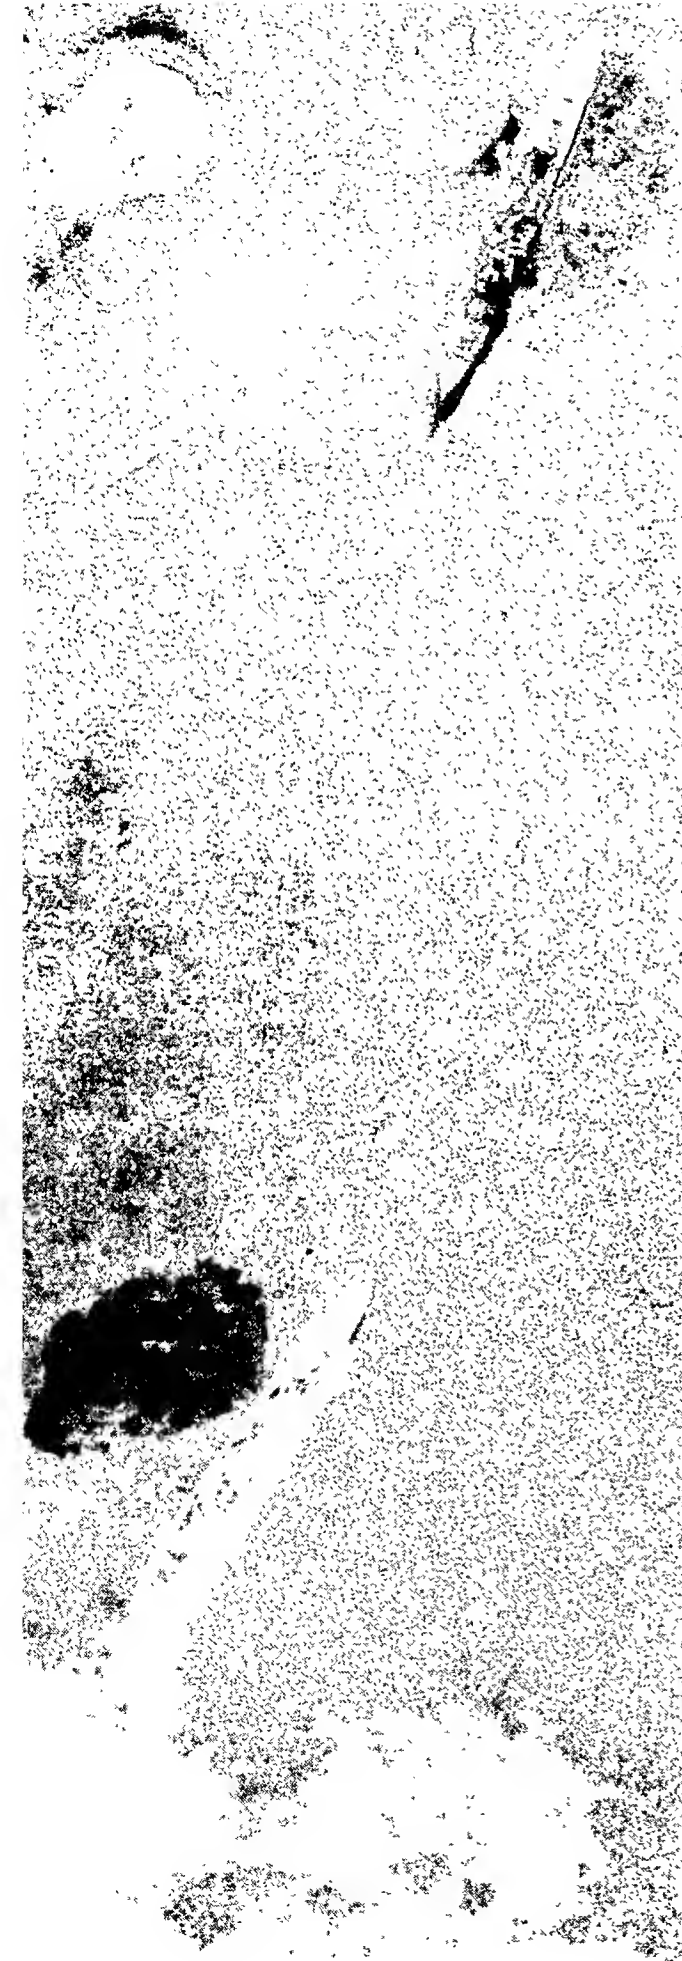

Theory of Combat.—The theory of combat for all armed forces is determined by the following considerations:

- Defence of colonies and the empire.
- Defence of the United Kingdom in the event of major conflict in western Europe.

All forces are united in the theory of an initial defence against attack, followed by repeated counter-attacks which may result in independent air, ground or naval engagement, or may be the result of joint operations. The navy has always hitherto been the initial force engaged in a major conflict. The army has usually been a small force operating independently in colonies and other parts of the empire, or a large force engaged in one theatre of operations on the continent.

The air force, like that of other major powers, was not tried in a major air engagement.

It appears that the theory at present in effect would be the use of a small ground force joined with allies in an initial defence on the ground, followed by counter-attacks, the result of joint land, air and naval action; while placing great dependence on the effect of sea control and blockade.

Strategical Considerations.—The position of the United Kingdom in relation to western Europe where the nation is open to invasion from the water and aerial attack from Europe, has resulted in the adoption by Britain of a large navy to protect shipping and to permit uninterrupted control of the sea lines approaching the home territory. Further, the historic necessity for military intervention on the Continent has required the adoption of a small, efficient, expeditionary force available for use in western Europe. Politically, Britain has commitments in all parts of the globe and conversely has obligations which require close attention to major political developments throughout the world. As a great commercial nation, with traditional political associations with the major powers and geographically with nearly all world areas, Britain is faced with the necessity of maintaining large defence forces or the provisions for rapidly securing such forces. Britain seeks to maintain peace as means of the maintenance of the order—and the trade by which she lives. It is imperative that France and Belgium, adjacent to Britain in western Europe, be protected from danger and be retained as partners in the promotion of peace.

These considerations have led Britain to the adoption of a policy of international agreement as a means to the solution of major political and economic differences.

France.—System of National Defence.—The armed forces of the nation consist of the army, the navy, the air army and the gendarmerie or national police force. Constitutionally the president of the republic is the supreme commander of all armed forces. Actual control and administration are exercised by respective ministers of the various departments.

On Jan. 21, 1938, Premier Edouard Daladier, minister of national defence and war, extended his powers over the minister of interior (police), minister of air and minister of marine (navy). The chief of the general staff of national defence is the principal adviser to the minister of national defence. General Maurice Gamelin was appointed to that position and still retained (Jan. 1, 1940) his duties as chief of the general staff of the army. The supreme council of national defence which includes a general secretariat under the orders of the minister of national defence and war; the permanent committee of national defence and the army general staff, all consist of representatives of all armed services and of the ministers of the Government, and are charged with making studies and recommendations on important questions affecting national defence. The Premier of France controls and co-ordinates national defence measures while the chief of the general staff of national defence (General Maurice Gamelin) co-ordinates mobilization and war plans for the ground and air forces.

In Sept. 1939 the French and British Governments announced an agreement for co-ordinated control by Gamelin of the French and British armies, also plans for joint air forces and for combined naval forces.

The War Department of France consists of the following agencies for military control and administration: the superior war council, the general staff of the army, the central administration, the directorates, the inspectorates-general, the geographical department.

A number of other agencies are charged with the administration of transport, including railways, roads; ammunition supplies, including explosives and arms; industrial mobilization, including labour; and an advisory committee on colonial defence.

PHOTOGRAPH taken from a German bomber during raid on the Firth of Forth Oct. 16, 1939. The British cruiser "Southampton," at the top, has just been partially hit by a bomb, while misses are recorded by the foaming water at the upper left, and the dark churning water beside the cruiser "Edinburgh" at the bottom

The superior war council consists of the minister of war (president), the chief of the general staff (vice-president), the marshals of France and 12 generals. Its chief function is to study and advise on all matters affecting preparation for war and organization of the army. Instruction and training of troops, concentration and mobilization plans and the organization of fortress defences are important subjects within the considerations for this council. The general staff of the army consists of the chief of the general staff of the army and two principal assistants. The first assistant is the chief of staff of the armies in the field, and is directly responsible to his chief for all matters pertaining to duties of the commander-in-chief of the armies in the field. The second assistant is chief of staff of the army, and is directly responsible to his chief for the conduct of the affairs of the general staff of the army at the war department headquarters. The balance of the general staff of the army includes a secretariat, four principal bureaus for personnel, intelligence operations and supply, a technical research bureau, and four sections in charge of affairs for general administration, codes, overseas forces and historical research.

The inspectorates-general function as senior inspectors for all troops, training and military works, in time of peace. In times of war the responsibility for these activities passes to the individual unit or organization commander.

Army.—The following table is an estimate of the strength of the organized forces in the various components:

	France	Morocco	Algeria	Near East	Colonies	Total
Regular Army (active)	465,000	70,000	100,000	14,000	65,000	714,000
Gendarmerie (Garde Mobile)	47,000			300		47,300
Garde Republicaine (de Paris)	5,000					5,000
	515,000	70,000	100,000	14,300	65,000	764,300
Reserves (French)						4,000,000
Reserves (Native)						500,000
Peace-time number of divisions—32-41						5,264,300
War-time number of divisions—120-150						
Including reserves in France beyond legal age, and adding untrained or partially trained natives from North Africa, France could add another 2,000,000 men						2,000,000
TOTAL MANPOWER						7,264,300

Navy.—The following is an estimate of the strength of the organized forces and total ships as of Sept. 1, 1939: *Personnel* (active): commissioned, 5,650; enlisted, 92,000; a total of 97,650. *Personnel* (reserve): commissioned, 5,000; enlisted (fully trained), 150,000; enlisted (partially trained), 350,000; making a total of 505,000. *Ships* (all categories including battleships, cruisers, destroyers, aircraft carriers and submarines, but excluding torpedo boats, escort vessels, tenders, mine sweepers and similar assorted small craft): in commission, 173; tonnage, 815,000; building, 61; tonnage, 210,000. Naval aviation is an integral part of the naval forces. The *personnel* includes: commissioned, 450; enlisted, 3,500; enlisted reserve, 6,000; making a total of 9,950. *Planes*: pursuit, 30; observation, 50; patrol, 25; training and others, 70; a total of 175.

Air Forces.—The following table is an estimate of the strength of the organized forces and totals of aircraft in the various components as of Sept. 1, 1939:

	Personnel	Active	Reserve	Total
<i>Commissioned</i>				
Pilots		2,500	5,000	7,500
All others		1,300	4,500	5,800
<i>Enlisted</i>				
Pilots		2,400	5,000	7,400
All others		44,000	150,000	194,000
TOTALS		50,200	164,500	214,700

Planes: pursuit, 1,100; observation, 330; bombardment, 1,250; training, 500; transport and service, 25; a total of 3,205 (many of these obsolete). Plane production rate (Sept. 1, 1939) was 250 (monthly).

Theory of Combat. The theory of combat for all arms in France is an initial defence followed by co-ordinated land and air attack, combined with naval blockade of enemy coastal positions. The land forces of France represent a large, well organized, well led, modern force, with modern equipment, in position behind well defended frontiers. The air forces appear to be less modern than potential opponents, but combined with potential allies able

to engage in major aerial combat.

The naval forces are able to patrol colonial and other possessions of the French empire and appear to adopt the theory of defence for essential communications (notably those with north and west Africa) combined with limited attack when odds offer favourable advantage.

Strategical Considerations.—The geographical position of the country permits the adoption of defence on nearly every frontier. The completion of artificial barriers has made the natural obstacles useful in this system of defence. It appears unlikely that any enemy naval attack could be launched against the mainland, and without the reduction of France as a political area, the African empire and other positions could be defended. Politically, the nation has adopted the policy of seeking world peace as a basis for retaining national security. Present weaknesses in securing adequate manpower and political commitments in western Europe and other parts of the world place France primarily on the defensive.

Alliance with Britain and a policy of joint defence with Belgium are considerations accepted by necessity, with a view of securing joint forces to maintain a joint peace.

Poland.—*Organization for National Defence.*—The supreme command of all military forces was vested in the commander-in-chief, the president of the republic. A committee of state defence included the president of the republic, the president of the council of ministers, the minister of military affairs and other officials of the Government. The administration of the army and the navy was co-ordinated under a ministry of national defence, charged with the duties of co-ordinating all activities looking to the maintenance of adequate armed forces for the defence of the country.

	Active	Reserve	Total
<i>Army:</i>			
<i>Personnel</i>			
Commissioned	10,000	50,000	60,000
Enlisted	320,000	1,000,000	1,320,000
	330,000	1,050,000	1,380,000

Additional manpower estimated at about 2,000,000 or a total manpower of about 3,500,000. The peace-time division strength was 35; war-time division strength, 70.

The following is an estimate of the strength of the various components as of Sept. 1, 1939: regular army (active), 360,000; reserves (trained), 300,000; reserves (partially trained), 1,200,000; service military forces (frontier guards, state police, customs service), 65,000; a total of 1,925,000.

Poland could organize 30-35 divisions in peace-time and with ample time in a prolonged conflict might raise and equip another 20-30 divisions. The bulk of reserves would be used as replacements and the estimated additional manpower available was 2,000,000, or an assumed effective manpower of close to 4,000,000.

Navy.—*Personnel*: commissioned, 500; enlisted, 5,600; a total of 6,100. *Ships*: commissioned, 5, tonnage 6,000; building, 2, tonnage 3,000. About 25 small craft, including 10 river monitors and river gunboats, as well as a number of motor boats made up the small navy.

	Active	Reserve	Total
<i>Air Forces:</i>			
<i>Personnel</i>			
Commissioned	800	220	1,020
Enlisted	4,500	500	5,000
	5,300	720	6,020

Planes: bombers, 465; fighters, 110; observation, 80; training, 90; transport and service, 55; a total of 800. Peace-time squadrons approximately 40 to 45; war-time squadrons approximately 60. Plane production rate (Sept. 1939) 30 (monthly); (Dec. 31, 1939) none.

Theory of Combat.—No definite theory of combat is offered in an analysis of Poland. The alliance with France appears to have established a similar theory of international defence, followed by counter-attack when opportunity offered. The limitations in numbers and in equipment, as well as considerations of potential opposition, resulted in the adoption of defence as of paramount importance in combat.

INCIDENTS IN THE CONQUEST OF POLAND. *Left:* Bridges across the Vistula at Tozew in the Corridor blown up by retreating Poles early in Sept. 1939 to delay the German advance. *Centre:* Nazi medium tanks rolling out to an attack

"somewhere in Poland." *Right:* The first shot of the war was fired by the German training ship "Schleswig-Holstein" at Westerplatte peninsula in Danzig harbour early in the morning of Sept. 1, 1939

Strategic Considerations.—Geographically Poland had no natural frontiers which offered any considerable security against invasion. A limited coast line was open to attack by more powerful naval forces on either side. In the west, no natural obstacles and limited artificial barriers existed against armed attack. In the east, the frontier was divided by extensive marshlands but offered easy avenues of approach north and south of the marshland area. Politically, changes had resulted in the loss of favourable natural frontier obstacles in the south and southwest; the nation was committed to continuous efforts to secure favourable alliances with other and more important European powers. Internally, inadequate economic system resulted in poor lines of communication and inadequate sources of procurement and maintenance of war materials. The entire central area of the nation appeared to be a potential manoeuvre ground in the event of conflict between Germany and Russia, or a probable area of expansion in the event of German and Russian alliance.

Russia.—Organization for National Defence.—The Union of Soviet Socialist Republics is organized with a supreme council or Soviet, which exercises supreme control of the Government of the separate Soviet Socialist Republics. This supreme council delegates most of its authority for control of the military forces to the People's Commissariat for Defence. This commissariat is in reality a department of national defence and is headed by a commissar. The commissar for defence controls a military council which consists of political commissars for all territorial districts, who, in company with the military commanders, exercise the administration of the armed forces. Military orders are required to be the unanimous decision of the military commander, the political commissar and the chief of staff or superior commander of the particular organization involved. As a matter of administration, the supreme council or Soviet of the Republics operates with a similar body known as praesidium, consisting of 37 members, charged with control of appointments, removals and mobilization orders for the military forces of the nation.

Army.—Regular army: active, 660,000; reserve, 380,000; total, 1,040,000.

Mobilization of territorial or reserve organizations (partially trained) could result in an additional strength of 1,300,000 men. Accepting limitations requiring adequate equipment for available manpower, it is estimated that Russia could place 100 to 110 divisions (of all types) in the field on opening of hostilities and 50 to 60 additional divisions in the field within three months of mobilization. However, only 25–30 of this total can be described as first-line divisions. The forces are widely scattered, including European Russia, the Caucasus, central Asia, Siberia, and the Far East.

The Navy.—Estimate of Russian naval strength is subject to the limitations imposed by secrecy and censorship.

Personnel: Commissioned, 5,000; enlisted, 68,000; total, 73,000.

Naval reserves are considered adequate for surface craft commissioned after mobilization, but considered inadequate for undersea craft.

Ships: In commission, 239; tonnage, 228,000; building, 200 (mostly undersea craft); tonnage not estimated. Co-operative air squadrons are known to operate with the air force, numbers and strength unknown.

The Air Force.—Personnel: pilots, active, 8,500; reserve, unknown; total 8,500. All others, active, 55,000; reserve, unknown; total, 55,000; grand total, active, 63,500. **Planes:** Bombardment, 1,500; observation, 1,200; fighter, 3,000; transport and service, 2,000; total, 7,700 (including reserves). Of these, about 3,500 are first-line.

The estimates on personnel do not include semi-military organizations and extensive civilian organizations which include large numbers of partially trained pilots and mechanics. The estimates on planes do not include production capacities for large bombardment aviation. Reserves in the air force are considered adequate in personnel for replacements up to 50% of anticipated losses. Reserves for ships are considered adequate in numbers but inadequate in efficiency for replacement up to include 25% of anticipated losses in combat.

Theory of Combat.—The theory of combat of all arms of the Russian forces includes the adoption of modern technique involving the use of mechanized forces in conjunction with large scale ground movements in original attack on weaker States or delayed defence against equal or superior opposition. Within the several services the offensive is emphasized and the theory of carrying the combat to enemy soil is laid down as a cardinal principle. Whenever defence is employed, the adoption of an active defence including the use of mechanized forces for sharp counter-attack within the defence zone, is accepted as a modern part of the general theory of combat. Russian forces appear to include in any general theory of combat favourable consideration for the use of propaganda and widespread expansion of subversive activities as component parts of an active offensive against an opponent.

Strategic Considerations.—The political policy of the U.S.S.R. was publicly announced during the period 1920–30 as a policy emphasizing the stimulation of world revolution. The more recent public announcements of the policy of the predominant political party have emphasized the maintenance of world peace. Geographically, the nation faced potential enemies on two frontiers until after September 1939, when the pacts were completed with Germany and Japan. It appears that the basic policy of the military forces included defence of the frontiers and rejected excursions into the field of military conflict outside the national borders. The acquisition of Finland, the Baltic States and eastern Poland, as well as the recovery of Bessarabia in the south-west are considerations which lead to the conclusion that the strategy of opportunism affords Russia more incentive for engaging in wars of conquest. The Sino-Japanese conflict in the Far East and the preservation of rich, natural resources in south

GERMANY'S MOTORIZED COLUMNS advanced on time-table schedules as Poland collapsed in Sept. 1939. *Left:* German motorcycle scouts pass rapidly through a town near Bydgoszcz. *Centre:* The scouts abandon their motorcycles and rush

to meet a Polish attack. *Right:* Pioneers (engineers) of the German army carry a section to repair a bridge; the efficiency and speed of their work was an important factor in the army's rapid advance

and central Asia indicate the maintenance of an international defence policy in these areas. Subject to the opinions and decisions of a closely-knit political organization, dominated by a single individual, the actual operations of the military forces of the nation become unpredictable. The best estimate seems to indicate that Russia has practically inexhaustible resources in men and material and could afford to accept or reject opportunities for conquest or adopt delaying defensives against opponents with equal impunity over the short period of time. In the long view the stability of the political system and the maintenance of an internal economy and system of transport which guarantees food, shelter and clothing for the majority of the Russians, would determine the final result of any policy adopted.

Finland.—*Organization for National Defence.*—All armed forces of the nation are under the command of the president of the republic under the constitution of the State. The administration of the armed forces is controlled by a minister of defence, an army commander and a commander of the civic guard. The conduct of military operations is administered by a general staff, including departments of personnel, intelligence, operations and supply and inspectorate. (See *Finnish Armed Forces*, page 266.)

German Campaign in Poland.—Germany.—In Aug. 1939 the German Army had an estimated strength of 90 infantry divisions, each consisting of approximately 14,000 men; 6 mechanized divisions, each composed of approximately 11,000 men; 3 light mechanized divisions, 1 horse cavalry division, 2 or 3 mountain divisions and a reserve of Landwehr (fortress troops) estimated at 20 divisions. Exclusive of fortress troops, Germany could mobilize slightly more than 100 divisions of all types, fully equipped with modern weapons and adequately organized for a campaign in Poland. It must be remembered that the tense situation in August included mobilization on a large scale and that these estimates allow for pre-war rather than peace-time totals. The total manpower of these forces is estimated at close to 1,350,000 men.

The forces for the campaign were divided into two army groups under the high command of Colonel-General Walther von Brauchitsch. The southern group was commanded by Colonel-General Karl Rudolf Gerd von Rundstedt, with Lieutenant-General Mausein as chief of staff. The right wing or south army of this group was commanded by General List. The centre army of this group was commanded by Artillery General Hans von Reichenau. The left wing or north army of this group was commanded by Infantry General Johannes Blaskowitz. The northern group was commanded by Colonel-General Fedor von Bock, with Lieutenant-

General Salmuth as chief of staff. The Pomeranian Army of this group was commanded by Artillery General Guenther von Kluge. The East Prussian Army of this group was commanded by General von Keuchler. The centre between the two groups was held lightly by frontier detachments. *See map: Sketch No. 1, p. 258 (Dispositions of German-Polish forces on Aug. 31, 1939).*

In the air forces, Germany had organized 4 air fleets, each responsible for a territorial area of Germany. Air fleet No. 1 centred around Berlin and faced Poland. Air fleet No. 2 covered the northwest and faced the Netherlands, Belgium and England. Air fleet No. 3 in the west and south pointed toward France and Switzerland. Air fleet No. 4, recently organized in former Austrian and Czech territory, faced to the southeast. Two special air commands existed in addition to the air fleet organization. One was centred in East Prussia, the other in the industrial area between the Rhine and the Weser. Marshal Goering was commander-in-chief of the air force, with Major General Jeschonneck as chief of staff.

Air fleet No. 1 was commanded by General Kisserling. Air fleet No. 4 was commanded by General Loehr. These two air fleets conducted the bulk of the air operations in the German-Polish campaign. Each air fleet was estimated in Aug. 1939, to have consisted of about 1,700-1,800 combat planes, including 1,200-1,500 (approximately $\frac{2}{3}$) bombers. The East Prussian air command was expected to reach a total of 800 planes and the industrial area air command in the west was estimated to have the same number. The grand total of planes for the four air fleets and the two air commands was expected to reach a minimum of 8,400 first-line planes. A composite estimate places the actual number of first-line craft available in August at a maximum of 6,500. Reserves for the Polish campaign were considered adequate up to 100% replacement of all anticipated losses. On the sea, Germany was invincible in comparison with the Polish naval strength. The small seacoast and the proximity to German bases afforded Germany a predominant advantage for the projected campaign.

Poland.—In Aug. 1939 the Polish Army consisted of 30 infantry divisions; 1 cavalry division and 11 independent cavalry brigades; 12 regiments of heavy artillery for corps and army use, and a partially organized mechanized division which more closely approximated 2 independent and poorly equipped mechanized brigades. The reserve strength was estimated at a maximum of 30 divisions. The Polish Army was weak in heavy artillery, anti-tank and anti-mechanized guns, and there were severe shortages in anti-aircraft guns and in air defence organization. Poland placed a maximum of 500,000 men in the field during the early stages

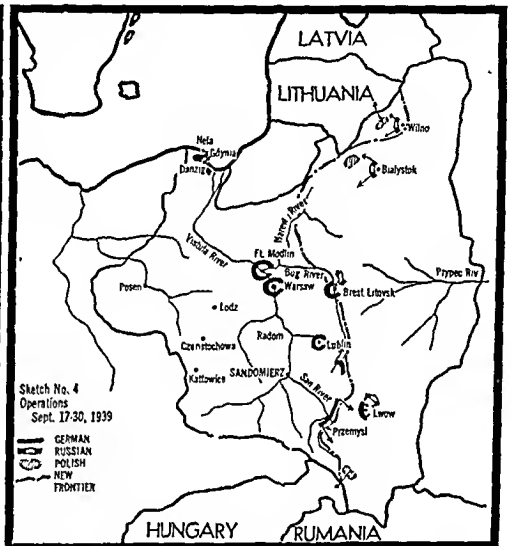

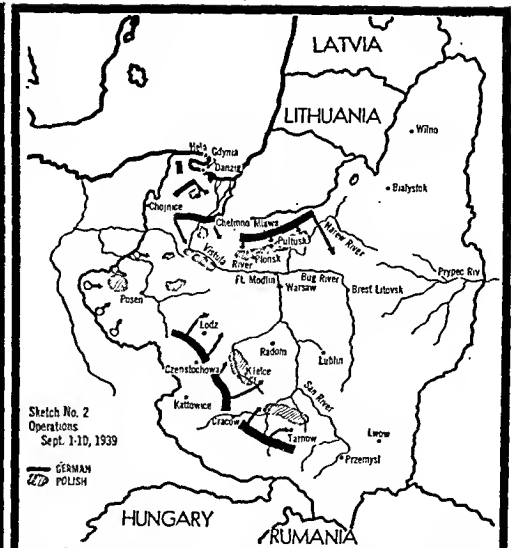

of the campaign. The Polish Army was under the command of Marshal Edward Smigly-Rydz. Under his command the Polish Army was divided into three main groups as follows: the Corridor army, along the Vistula river, south and south-east of Thorn, under the command of General Bortnowski; the centre army, in the area Lodz-Piotrkow-Kielce, under the command of General Kutrzeba and General Rommel; and the southern army, on the Nida river, centring on Cracow, under the command of General Sosnkowski.

In addition to these main groups there were subordinate concentrations in the east along the Narew river, north of Warsaw near Pultusk; and in the south along the border near Tarnow and Jaroslaw. Scattered Polish cavalry defence units, supported by reserve infantry, occupied delaying positions along the East Prussian frontier around Ciechanow, north of Warsaw; on the western border of the Corridor, west of Posen, south of Kalisz, along the Polish-Silesian border, and through the mountain frontier passes along the Slovak border. See map: Sketch No. 1 (dispositions of German-Polish forces on Aug 31, 1939).

In the air forces, Poland had organized two aviation groups of six regiments comprising an estimated total of approximately 900-1,000 planes. No more than 25% were bombers. Reserves were considered inadequate for replacements of more than 10% of anticipated losses. The Polish Navy was far inferior compared to the German naval strength.

The Scheme of Manoeuvre: German.—The primary goal of the German Army was the destruction of the Polish Army. The secondary goal was to destroy that force so swiftly that Poland would be eliminated as a military factor in Eastern Europe before Allied pressure in the west became dangerous. This scheme was decided upon after examination of political, economic and military factors, which led the German High Command to the following conclusions:

- (1) Poland would fight.
- (2) Poland over-rated her ability to prolong the campaign.
- (3) Poland under-rated the strength of the German Army and air force.
- (4) Poland counted on strong Allied pressure along the German west front at an early date.
- (5) Poland would attempt to occupy Danzig, attack East Prussia, delay in the Posen area, and fall back slowly along the Vistula, defend the southern frontier, and launch vigorous and frequent horse cavalry attacks against the flanks of the northern and southern German Army corps.
- (6) England and France might support Poland by declaring war, but would be unable to join Poland on the battlefield.
- (7) France could not mobilize and launch a serious attack on the ground in the west before at least 15 days. This attack would not be launched without tangible evidence of British participation which would delay the

opening date at least another 15 days, a postponement to 30 days after the opening date of the German campaign in Poland.

(8) No independent or joint French or British air attacks would be launched against Germany for fear of reprisals against Allied mobilization targets.

(9) The only risk involved was unexpectedly prolonged Polish resistance and the high command of the German Army provided a scheme of manoeuvre considered capable of overcoming this danger.

The German Army scheme of manoeuvre was a simple double envelopment, including a powerful drive from southwest toward Warsaw, and a second from Pomerania and East Prussia (in the north and northwest) toward Warsaw.

The southern group, consisting of three armies, had the mission of moving northeast with the main effort made by the centre army. The south army (right wing) was to protect the southern flank, force the Jablunka pass, and move to the east toward the San river valley. The north army (left wing) was to protect the north flank and assist the centre army in the capture of Warsaw.

The northern group, consisting of two armies, was to move to the southwest upon Warsaw. The East Prussian Army (on the left flank) was to cross the Narew and Bug rivers and join the centre army of the southern group. The Pomeranian Army (on the right flank) was to drive across the Corridor, join the East Prussian Army, and advance toward Warsaw to join the north army (left wing) of the southern group.

This basic scheme of manoeuvre included at least six separate and subordinate manoeuvres which contributed to the general plan.

These manoeuvres were as follows:

In the southern group:

(1) The southern army (right wing) to advance across the Carpathian mountains to the Tarnow railroad.

(2) The centre army to envelop the industrial district in Silesia and capture Cracow.

(3) The northern army (left wing) to drive past Lodz and advance to Warsaw.

In the northern group:

(4) Simultaneous invasions of the Corridor from the north and from the east by the Pomeranian Army (right flank) and by the East Prussian Army (left flank).

(5) A drive from southern East Prussia by the East Prussian Army (left wing) to the Narew river via Mława and Przasnysz.

In Danzig:

(6) The defence of the city, by organized defence corps volunteers, charged with the capture of municipal buildings (post offices, etc.), rail and water facilities, power and light outlets and communications (radio and telephone).

The goal of the German Navy was the destruction of the Polish naval forces, the capture of Polish naval bases, and the rapid establishment of German control over the Polish coast line. The naval scheme of manoeuvre included:

(1) Capture and destruction of Polish naval forces.

(2) Close the bay of Danzig.

(3) Bombardment of Gdynia-Hela and Westerplatte.

(4) Construction of mine barriers and expansion of German seacoast patrols.

The goal of the German air forces was twofold:

(1) The destruction of the Polish air force, and

(2) The destruction of Polish communications (highways, railroads, etc.) essential to mobilization.

Subordinate missions included the support of mechanized and motorized attacks, the systematic bombing of naval bases, naval craft, ammunition and other supply bases and industrial centres.

Air fleet No. 1 and air fleet No. 4, augmented by reinforcements from the remaining two air fleets, were constituted with an estimated strength representing approximately 85% to 90% of all available first-line combat planes.

Summation of German Plan.—The German high command co-ordinated political, economic, and military estimates of both the Eastern and Western fronts; and made analysis of the plans open to Poland; carefully evaluated the time factor, assigned specific missions to the ground, air, and naval forces; adopted a simple scheme of manoeuvre; and concentrated force behind the main effort.

The Scheme of Manoeuvre: Polish.—The goal of the Polish Army appears to have been based upon the following considerations:

(1) A general defence of the Western border, with minimum force.

(2) The gradual evacuation of frontier areas, keeping the bulk of the army intact for position defence and counter-attack.

(3) The delivery of sharp, sudden counter-attacks, mainly by independent cavalry units against exposed flanks.

(4) A final position defence around Warsaw, based upon the Vistula-Narew, Bug, and San river valleys; supported by reserves drawn from the east, and by Allied pressure against Germany in the west along the Rhine and in the north by naval blockade.

The Polish air forces had the mission of attack against enemy aircraft, distant observation of enemy ground forces and continuous bombing of enemy communications and troop concentrations.

The Polish navy followed no plan looking for engagement with the German fleet. If preparations for escape may be classified as long range defence measures for the future, then the Polish naval command may be credited with the adoption of some naval defence measures in the Baltic. Coastal defences, including garrison forces at Westerplatte, were prepared to resist landing parties. No extensive preparations, including mines, or long range coast defence guns, appear to have existed.

Summation of the Polish Plan.—The Polish high command, well aware of the general nature of the German plan and dispositions, and realizing that the impossibility of early Allied aid prevented adoption of a strong offensive action, determined upon a general delaying defensive over a wide front followed by gradual retirement to interior defensive positions. Two important considerations appear to have been neglected by the Polish leaders:

(1) The strength and extent of German air force activities, and

(2) The extent of German mobilization prior to Sept. 1, 1939.

The Opening of Hostilities.—At 5:45 A.M. Sept. 1, 1939, Germany launched the first organized offensive across the Polish frontier.

Northern Group: September 1-7.—The Pomeranian Army

(right wing) under General von Kluge, crossed the Polish frontier at Chojnice and advanced in the direction of Chelmno and the Vistula river. The German troops reached the Netze river and approached the banks of the Brahe, where determined Polish resistance was encountered. On September 3, the Brahe was crossed and East Prussian detachments approached Graudenz and attempted a junction with the right flank forces in preparation for a crossing of the Vistula. Polish forces, under General Bortnowski, were holding positions along the Vistula between Graudenz and Blomberg. Resistance in the vicinity of Graudenz was offered in an attempt to prevent envelopment of the Polish right wing by the swiftly moving columns of the East Prussian detachments. On September 5, the Polish forces retired under the heavy German pressure, and the Pomeranian Army crossed the Vistula near Graudenz and at Chelmno. (See map: Sketch No. 2, p. 258.)

In the meanwhile the East Prussian detachments captured Graudenz and the junction of the two forces was effected on September 7. General Bortnowski withdrew south of the Vistula in the direction of Warsaw and his forces began to receive large numbers of Polish troops retreating from the province of Posen. German frontier troops in the west began a systematic advance through open approaches in the Posen province, and rapidly closed in on Polish forces retreating to the east in the direction of Warsaw.

On the left flank of the northern group, the East Prussian Army, under General von Keuchler, advanced on September 1, across the Polish frontier, overcoming early resistance. This army eventually came to a halt before strong Polish forces between Pultusk on the Narew river and Plonsk on the Saldau river. Polish forces in the area between Mława and Lomza, under General Przeczmirski, had accomplished the difficult task of bringing the German Army attack to an abrupt, if temporary, halt. It is estimated that these Polish forces were only partially organized and included large numbers of reserves. Like other Polish troop concentrations, this group suffered severely from shortages of adequate artillery and other essential equipment.

Along the coastline, German detachments, assisted by naval vessels, had opened an attack on Gdynia and were engaged in the reduction of Polish coastal defences.

During the first week of the campaign, the Pomeranian Army and the East Prussian Army of the northern group, operating as three independent units (including East Prussian detachments of the right wing) had succeeded in penetrating the Corridor and isolating Danzig, the seacoast, and the mouth of the Vistula; had pushed large Polish forces south and east along the Vistula, and directly south from the East Prussian frontier in the direction of the outer defences of Warsaw. It appears that General Bortnowski made a serious error by delaying his movement to the south and east. Prompt retirement with the bulk of his force to the vicinity of Warsaw would have afforded him the opportunity to dig in and prepare a determined defence, with the majority of his troops intact. His stubborn resistance and deliberate retirement resulted in heavy casualties and the loss of valuable time needed for the preparation of a proper position of defence.

Southern Group: September 1-7.—The southern group, under General von Runstedt, crossed the Polish frontier on Sept. 1, 1939. The south army (right wing) under General List, forced the Jablunka pass, in the West Beskids, and on September 2 arrived in the vicinity of Teschen. The centre army, under General von Reichenau, crossed the lower branches of the Prosna river and the valley of Wartche, captured the city of Czeszochowa and pushed on rapidly in the direction of Radom. On September 5, the city of Kattowitz, on the left flank of the southern army, fell before the German advance. Within 24 hours, the principal southern city, Cracow, was open to attack from three sides, and on September 6 the German forces occupied the town. Mechanized units of the

centre army advanced far ahead of the ground units. Disregarding the traditional rigid requirements of continuous lines of communication to front and rear and constant liaison with adjacent elements, and dispensing with considerations for flank protection, these mechanized forces operated independently, far ahead of the main elements of raiding missions, accomplished their purpose with amazing speed. Elements of the swiftly moving mechanized troops, were reported at Kielce on September 5, at Piotrkow on September 6, and north and west of Lodz on September 7.

The north army (left wing) under General Blaskowitz, had advanced abreast of the centre army and rendered assistance in the reduction of the primary objective for the southern army group, namely the destruction of the main Polish forces and the capture of the industrial area centred around Cracow. Not later than September 3, General Blaskowitz began to accelerate the movement of his forces in the direction of Lodz and the main effort of the southern half of the double envelopment began to be developed. By September 7, the north army (left wing) had centred its main effort in the direction of Sieradz-Lodz-Warsaw, with advance elements far to the north operating against retreating Polish forces from Posen and against elements of the left flank of the retreating Corridor army as it moved to the east and the south along the Vistula. Mountain troops from positions east of the right wing of the southern group, and operating independently, crossed the East Beskids pass and captured Nowy Sacz, driving scattered Polish forces back towards Tarnow.

During the first week of operations, the three armies of the southern group had penetrated the Polish resistance, captured the important industrial areas in the south, disorganized the elements of Polish concentrations, released speedy mechanized columns on raiding missions far to the front, and launched a strong main effort in the direction of Warsaw, with the objective of closing the gap between the two groups of German forces.

The Polish forces had withdrawn hastily from southern frontier stations, failed to maintain contact between elements, fought and lost engagements on open ground without resort to position defence, and neglected opportunities to withdraw to the Vistula river in numbers and with equipment suitable to support a determined resistance in conjunction with the remaining forces in the north and west.

Air Operations: September 1-7.—The missions of the German air forces included: the destruction of communications, both rail and road, and the systematic reduction of Polish air forces and air installations. The attacks on the Polish railway net centred along the main north-south lines. These included the Bialystok-Brest-Kowel-Lwow sector; the Mlawa-Warsaw-Lublin-Przemysl sector and the Gdynia-Bromberg-Kattowice sector. Junction points where control stations and equipment were concentrated were the initial targets. The few main highways converged on these rail junctions in most cases and these were included in the air attacks. The air force mission, directed toward the destruction of Polish air bases, was accomplished with speed and precision. Forty-eight hours after the opening of hostilities, the Germans claimed that the Polish air forces had been destroyed or rendered inoperative. In many cases Polish planes were bombed in the open on Polish airfields. Hangars and other ground installations were destroyed, airfields were rendered useless by severe concentrated bomb raids, while scattered Polish air forces, engaged in brief aerial combat, were overwhelmed by superior numbers and driven to the ground. It is significant that by the 4th of September German aerial attacks were directed against industrial aviation targets indicating that the primary missions had been accomplished and active Polish air resistance considered non-existent.

Summary of Operations: September 1-7.—German forces on the land and in the air advanced rapidly, overcoming all Polish resistance. In the north

the German drive slowed down in the vicinity of Warsaw, and Polish forces began a delayed but definite concentration of strength along interior defence lines north, west and south of Warsaw. Dry weather and the disorganization of preliminary troop concentrations favoured the advance of swiftly moving German mechanized troops. Destruction of communications had hampered co-ordinated action of Polish forces and prevented adoption of systematic delaying measures against mechanized columns. Large numbers of Polish forces were still intact and apparently no extensive capture of Polish troops had been accomplished despite early reports of wholesale surrender and destruction of large concentrations. It remained true, however, that frontier forces in many instances had been destroyed or dispersed while rear elements of main forces were still menaced by sudden attacks by independent mechanized columns. The primary missions of the German scheme of manoeuvre had been accomplished on schedule and with remarkable efficiency. The most serious disadvantages suffered by the Poles had been the devastating effectiveness of the German air attack which accomplished widespread destruction of Polish air strength and disrupted mobilization of several front line units and prevented concentration of reinforcements.

Northern and Southern Groups: September 8-16.—During this period the operations of the separate armies comprising these two groups resulted in joint activities. Mechanized elements of the centre army in the southern group continued to advance and on September 8 raiding parties entered the outskirts of Warsaw. The southern army (right wing) under General List, entered the town of Sandomierz at the junction of the San and Vistula rivers and faced an open approach to the north along the valley of the Vistula in the direction of Warsaw. Under General Blaskowitz, the north army (left wing) had continued to exert pressure against Polish forces north and west of Warsaw in the vicinity of Kutno. On the 14th of September, Polish reports indicated that the first serious Polish counter-attack had been launched against the left flank of the southern army group between Kutno and Lodz. It appears that this attack was a combined effort of General Kutrzeba and General Bortnowski to gain time for the completion of adequate position defences west of Warsaw. This counter-attack temporarily halted the advance of large German forces, but offered little resistance to the continued operations of the independent mechanized columns. North of Warsaw the East Prussian Army, under General von Keuchler, had determined the extent and strength of the Polish position with the aid of efficient and uninterrupted aerial observation. Realizing that the Polish concentrations were poorly organized and without any apparent artillery support, von Keuchler decided to contain the bulk of the Polish concentration along the line Pultusk-Plonsk, with small holding forces, while he shifted the main German effort to the east (left) flank, with the mission of crossing the Narew river and enveloping the Polish right. (See map: Sketch No. 3, p. 258.)

On September 10 advance German columns of the East Prussian Army crossed the Narew and by the 14th of September the main Polish concentrations had been forced to retire to the south along the Bug and Vistula rivers. In the west relentless pressure of von Kluge's Pomeranian Army, combined with the resumption of attack by the north army (left wing) of the southern group under Blaskowitz, resulted in heavy fighting around Kutno where the German columns attempted to cut off large Polish forces retreating toward Warsaw. In the north in the vicinity of Bialystok, and in the south, east of the San river, independent German forces pushed vigorously toward Brest-Litovsk and Lwow respectively. East of Warsaw, German forces on the ground, assisted by constant aerial attack, had cut the Warsaw-Brest-Litovsk railway. By September 15, after two weeks of severe engagement and suffering from heavy losses, General Bortnowski's army entered Warsaw. During the remaining two days of this period, General Kutrzeba effected the withdrawal of most of his troops from engagement with the German columns and succeeded in joining General Bortnowski in the defence of the capital. The junction of the northern and southern army corps had been accomplished and the main Polish forces were virtually surrounded in an area centred around Warsaw. The close of the period found no established lines of resistance or continuous lines of German attack. The main

effort of the German Army had not yet been realized, and the full powers of Polish resistance had not been organized. Warsaw remained the capital of a besieged but determined people.

Summary of Operations: September 8-16.—The German armies in the north and in the south continued to exert considerable pressure behind the main effort to force the final issue in a joint attack against the main Polish forces. The operations of German mechanized troops continued to be independent actions concentrated upon the swift disorganization of Polish forces wherever encountered and without regard to the maintenance, or even recognition of, German lines of communication. German air forces continued operations of brilliant precision and accomplished results which indicated the existence of an elaborate pre-campaign system of espionage and liaison. The Polish air forces, including ground installations considered secret, were promptly discovered and methodically destroyed. Air and ground liaison between observation planes and artillery directed effective fire on suitable targets. Air attack on Polish troop concentrations was uninterrupted and became more effective as Polish air resistance disappeared. The Polish main forces still remained intact, but were cut off from hope of reinforcement and faced severe shortages of essential supplies, due to the destruction of rail and highway facilities. The remaining possibilities of Polish resistance were under-rated by the German high command when it issued a communique on September 16, claiming that the only remaining tasks involved "mopping up operations."

The final unexpected development of the period broke upon the unprepared and harassed Polish nation on the morning of September 17, when Russian armed forces suddenly crossed the eastern frontier and began a second invasion of Poland. Faced theretofore with overwhelming numbers in the north, the west, and the south, subject to spectacular and sudden raids on all sides by powerful mechanized forces, Polish leaders still could count upon the heroic stand around Warsaw, followed by a slow, if necessary, retreat to the favourable defensive terrain in the eastern provinces. After September 18 the Poles faced not one enemy but two, and there now began a marked decline in Polish morale and disintegration of the Polish will to resist.

Final Operations: September 18-30.—With the advent of Russian intervention in the east, the Polish resistance withered and appeared doomed to failure. Heroic efforts were made in isolated centres. Around Kutno the joint efforts of the north army (left wing) and the southern group, in the Pomeranian Army (right wing) and the northern group, finally overcame stubborn Polish resistance after eight days of heavy fighting. This engagement called by the Germans the "Battle in the bend of the Vistula," resulted from Polish efforts to withdraw large forces to the north and east in support of the defence around Warsaw. Under General von Runstedt, the German armies gained decisive victory, capturing an estimated total of more than 150,000 prisoners and large stores of supplies. (See map: Sketch No. 4, p. 258.)

In the east the Russian forces encountered little resistance. Polish frontier guards and some reserves offered occasional and scattered defence. The principal directions of the Russian advance were toward Vilna, Bialystok and Lwow. The city of Vilna was occupied by Russian forces on September 19. Twenty-four hours earlier, advance elements of the German and Russian armies met at Brest-Litovsk. Despite these advances, the resistance of Polish forces in the vicinity of Warsaw and around the fortress town of Modlin continued stubbornly. For days the capital city held out under continuous aerial attack and artillery bombardment. Finally, on September 27, Warsaw capitulated. And on the 28th, the fortress of Modlin surrendered. The following day the German foreign office announced the completion of a treaty of "frontier and friendship" signed at Brest-Litovsk between the German and Russian commanders. Only a few Polish forces in the northwest continued to offer resistance. The coastal garrison on the peninsula of Hel had been surrounded and finally surrendered on October 2. Polish troops north of the city of Lublin, recognizing the impossibility of continuing the war, surrendered on October 5. On all sides of the compass Poland had been invaded, over-run and forced to surrender. What had begun as a classic manoeuvre by German troops on the north and on the south ended in a double penetration by joint German and Russian forces on a time schedule which offered little hope of successful resistance.

Summary of Operations.—In less than five weeks and with no more than 15 days of serious engagement, Germany had completed the speediest campaign in military history. Without disregarding the significance of the Russian invasion in the east, it remains true that the major effort was completed by the German forces. Russian intervention resulted in over-running the eastern provinces where little resistance was faced, and in

regard to military operations in the central part of the country, particularly where Polish resistance was stubborn, the Russian intervention affected the morale of the Polish troops more than the actual reduction of numbers or destruction of organized efforts. Approximately 700,000 Polish prisoners, 40,000 horses, 1,600 guns, 8,000 machine guns, hundreds of small weapons and light anti-tank guns were captured by German forces. The Polish air force had been destroyed, with the exception of a few planes flown to neighbouring neutral States. German losses, announced by Chancellor Hitler on Oct. 6, 1939, indicated that 10,572 had died, 30,322 were wounded and 3,409 had been reported missing on Sept. 30, 1939 (probably an under-estimate). Losses in motor transportation, mechanized equipment and other material were considered insignificant.

An analysis of the operations in the air, on the ground and on the sea indicates without qualification that all arms shared equally in the success of the German effort. There was evidence of complete and continuous co-operation between all elements of the German forces. When the ground troops required observation, they received it from an alert and efficient air force. When mechanized columns operated far ahead of the foot troops and extended lines of communication in what appeared to be dangerous areas, the air force promptly located and destroyed Polish artillery and prevented strong Polish concentrations prepared to launch counter-attacks. The flanks of the two main German groups held fast to their independent missions until the appropriate time to join their strength in the accomplishment of the final drive on the capital city. Along the coast, the German naval forces engaged in no serious combat with Polish naval forces and appeared to adopt a slow but persistent pressure against naval bases and the important seaport of Gdynia. Although the naval activities were not considered as spectacular as the swift march of German forces on the ground, it must be remembered that the German naval high command considered that Polish installations would eventually fall into their hands, and preferred to gain these prizes intact rather than destroyed as a result of constant and continuous bombardment.

The time factor, the strategic advantages in geography and season, and overwhelming numbers, all favoured the German scheme of manoeuvre. Polish concentrations were delayed, disorganized and ineffectual. The adoption of independent action by mechanized units introduced an unusual but highly successful method of big area disorganization against probable resistance. The weight of destructive armament has made modern mechanized troops tremendously effective wherever time and terrain favour their employment. The speed, precision, skill and efficiency of the plan, the operations and the results of the German campaign amazed an incredulous world. A nation of 30,000,000 people had been overrun, cut to pieces, and demoralized within three weeks. The German campaign in Poland will be accorded an unusual place in military history and will undoubtedly be considered one of the most brilliant of modern times. A detailed analysis of the reasons behind the Polish collapse indicate the following:

(1) Poland failed to estimate the full strength of German mobilization prior to Sept. 1, 1939.

(2) Poland failed to analyze the full possibilities of the German scheme of manoeuvre.

(3) Poland under-estimated the potentialities of the German air force—the possibilities of joint air and ground operations.

(4) Poland failed to adopt a simple scheme of manoeuvre, centred upon the early completion of a strong defensive position supported by ample reinforcements and adapted to the favourable terrain north, west and south of Warsaw.

(5) German co-ordination resulted in the systematic destruction of lines of communication along railways, highways, and radio, telephone and telegraph installations. The nerve centres of Polish control were shattered within 48 hours.

(6) A pre-campaign espionage system proved invaluable to the German high command.

(7) Weather conditions favourable to the offensive, and in the face of constantly diminishing resistance, permitted the use of mechanized columns without regard to normal security measures.

The Polish battlefield was a platform where the final results of a carefully conceived, well-organized, and ably-led scheme of manoeuvre were exhibited. Germany had planned carefully, acted fearlessly and gained victory on that field of battle. The greatest lesson that these operations appear to have shown to students of military history seems to be that time has indeed become the fourth dimension of strategy, as it has been called by the British military writer, General Rowan-Robinson. If it is true that there is time for everything, it is equally true that on the field of battle everything successful must be accomplished at the right time.

Western Front.—The military operations on the western front during the period Sept.-Dec. 1939, are best defined as preliminary reconnaissance. No large scale operations occurred involving thousands of men and machines and covering days or weeks of continued activity, seeking to gain or deny major objectives. Along the common French and German frontier, fortress troops were hidden behind modern and apparently impregnable defence zones separated by an unoccupied but dangerously quiet No Man's Land. In France the Maginot Line (*q.v.*) was completely manned by special frontier troops supported by mobilized forces of all arms. Here in elaborate field fortifications embodying the principles of defence-in-depth and equipped with modern devices for destruction of and protection against all attacks by air and land,

the French army waited for Germany to initiate the first major movement across the frontier. The French army was not idle during the period. Small operations were undoubtedly successful between the Luxemburg frontier and the Rhine. Reconnaissance parties extended activities several kilometres into the lightly fortified zones between the main defence positions. In the Saar valley, along the Moselle, through the Bienwald forest, and around the towns of Saarbrücken, Sierck, Bliescastel, Perl, Wissembourg and in dozens of tiny hamlets and villages along the front, the French attacked vigorously but with definite limited objectives. These attacks were made in movements so small that the action clearly indicated intentions of preliminary reconnaissance rather than the initiation of any larger offensive. During the period the artificial defences and the defence mechanism of the Maginot Line were perfected. Equipment and supplies were installed in preparation for the maintenance of large forces capable of offering determined and continued resistance against an invader. Overhead French aviators took to the air regularly on offensive missions including elaborate air photography of Germany's installations. Throughout the period frequent military engagements were fought and numerous raiding parties engaged in local combat.

In the first six weeks of the war France appeared to have taken the initiative in all operations reported on the ground and in the air along the western front. The result of these French operations indicate that an area 40 miles in length and varying in depth from 2 to 10 mi. was partially occupied by French forces after light and heavy artillery fire and aerial bombardment had driven scattered German troops and the remaining inhabitants to the rear. German reports indicated that a few border towns had been evacuated on orders and that desertion of certain areas was not entirely due to the success of French invasion. In late October and during November German official reports claimed that all French forces had been driven out of German territory. At the close of December neither side claimed any advantages in territorial gains. Reports of major engagements in the near future remained in the rumour stage and local communiques indicated "no activity" or "usual inactivity."

The German defence zone called the Siegfried Line (*q.v.*) or Limes Line was considered less formidable than the French defence zone. Construction of the series of fortifications had been started at a later date and evidence of continued construction activity during the September-December period indicated that completion of the defence had not been accomplished prior to the opening of hostilities. Impartial observers agree that despite defects in construction and accepting differences in the detail of elaboration of protective devices the German defence zone still remained a considerable obstacle for the combined British and French armies. The number of German forces engaged in the defence on the western front is estimated between 60-75 divisions including all arms. During the Polish campaign when large forces were engaged in the East, it is likely that Landwehr divisions and fortress troops were the only forces actually occupying the fortifications. At the same time the 30 days required to complete the campaign in Poland offered little opportunity to the Allies for the mobilization of men and the organization for attack on a strongly fortified and adequately manned defensive zone. At the close of the Polish campaign large forces were shuttled across the German interior and the elaborate organization of the defensive zone was rushed to completion. Late in December the minor operations in the area between the two zones were discontinued. Periodic duels were reported, probably the efforts of each side to perfect ranges and test equipment. Aerial activity continued with observations as the primary mission although limited air engagements involving small numbers of aircraft were reported.

On the north flank of the western front the relations between

Belgium and Holland, and between these countries and the belligerents gave rise to considerable speculation on the probability of invasion. Concern grew on all sides but there remained evidence of an increased tempo in the "war of nerves" rather than the possibility of actual combat. Both neutrals strengthened natural and artificial defence barriers. Each mobilized large forces and proclaimed a policy of determined neutrality. In joint conference King Leopold and Queen Wilhelmina discussed action in the event of invasion by Germany. At the close of their conference, the rulers issued a plea for peace. The practical result of these efforts appeared to be that Holland was prepared to defend her frontier against armed invasion and to offer serious delay to mechanized forces seeking quick transit through the Low Land country. Belgium with small but efficient fortifications strengthened by the recently constructed Albert canal and with a modern army already mobilized, could offer serious resistance to any opponent. Invasion of Holland would result in joint defensive action by Belgium. Invasion of Belgium alone might result in joint action by Holland. In either case, the two nations were rushing defence measures and organizing their nations for determined resistance. The offers made by Belgium and Holland for peace were doomed to failure.

On the south flank of the western front, Switzerland, traditionally a neutral, took prompt measures for defence. Partial mobilization of reserves, the accumulation of reserve stores of supplies, continued manoeuvres along the border entrances through the Alps, and a proclamation of neutrality were prompt notice that any attempted invasion would be met by determined resistance.

Luxemburg had no armed forces to mobilize and offered the entire area of her tiny country as a common neutral zone for evacuation of and medical care for the wounded of all belligerents. It appears that this was done in the hope that the close of the war might find the safety zone of Luxemburg still an independent state.

Summary.—All military operations on the western front were confined to the minor preliminary activities of reconnaissance, raids, and meeting engagements of small forces. Fortifications were strengthened, equipment and supplies were accumulated, large forces were organized and non-combatants were evacuated from defence zones. Aerial reconnaissance continued and minor air engagements were reported. No major offence was initiated and no co-ordinated air and ground attacks materialized. Flanks remained inactive and neutrals increased defensive measures and mobilized to resist invasions designed to envelop the elaborate defence-in-depth systems. A stalemate on the western front had followed the lightning attack in the East. It appeared doubtful that the Allies would begin any great land offensive in the West. For the western front the leading questions at the close of 1939 were:

- (1) Will Germany sit tight on the western front and continue to fight the blockade by naval and air action?
- (2) Will Germany make a frontal attack on the western front?
- (3) Will Germany try to outflank the Maginot Line?

The War at Sea.—The war at sea produced the most action during the period Sept.-Dec. 1939. All belligerents desired free access to world markets and each employed naval strength to secure freedom of action and impede or deny free movement to the opponent. The Allies had a considerable advantage in sea power. Britain alone with superior tonnage and with adequate bases in many parts of the world could negotiate a naval blockade against Germany without delay. The French navy could assist in blockade duties, secure water routes to colonial ports, and be prepared to join in naval engagements whenever these developed.

The German fleet had less tonnage than the Allies and was forced to operate from home bases in waters blockaded or partially denied by enemy craft. The naval strategy of the Allies was directed towards two main objectives: (1) a strong naval blockade in the North sea to contain the German fleet in the Baltic, and (2) a convoy system for merchant shipping to ensure uninterrupted ocean transport. The principle upon which Britain depended for success in the accomplishment of these objectives was the belief that in any naval engagement British seapower would always be

superior in numbers, and fire power, to any opponent. It has already been emphasized that England is dependent upon uninterrupted ocean transport. This necessity requires in turn that England maintain a fleet superior to any probable opponent. Prior to Sept. 1, 1939, the Axis Powers, and possibly Japan, were considered likely opponents. Against Germany and Italy, England, with French assistance, would be required to fight in the North sea and in the Mediterranean. If Japan entered the combat England would be forced to accept the challenge in the Far East. Her conception of naval strategy against Germany and Italy included prompt and continuous blockade in the North sea followed by swift attack in the Mediterranean based upon Gibraltar and Suez.

Joint British and French naval strength in Western Europe appears impregnable. Since Germany alone of the Axis Powers is actively engaged in combat, the naval power of the Allies is a definite superiority.

German naval strategy prior to Sept. 1, 1939, appears to have been based upon two principles: (1) rapid rearmament equal to or approaching 35% of British strength; and (2) additional construction based upon new necessities claimed as the results of (1).

The largest single factor which spelled danger for the German fleet was the probability of simultaneous engagement in the North sea and in the Baltic. Russia, after September 1, was eliminated as a potential enemy in the Baltic. German attention could then be directed against the Allied blockade. The principal means available for use included the tactics of independent surface raiders, submarine attacks, extensive mining and attacks from the air. All four methods were practical, relatively simple to adopt, and the types of naval engagement which Germany could continue over the long period. The primary mission of the German fleet was the methodical destruction of both naval craft and merchant ships by independent action of raiders and submarines and the joint actions resulting from mine fields and air attacks. Early in September the Cunard liner "Athenia" was sunk (September 3-4), apparently the result of torpedo or mine. The loss indicated one type of naval warfare which could be expected to continue. The definite cause of explosion and the loss of the ship remained undetermined at the close of the year. Britain claimed that a German submarine had torpedoed the liner. Germany denied this claim and charged that the British had sunk the vessel. Regardless of these claims the loss was the initial incident in naval warfare which continued to chalk up heavy casualties in merchant vessels as well as naval craft. On September 17 the British aircraft carrier "Courageous" was attacked by a submarine, torpedoed and sunk, marking the first important armed vessel lost in naval combat. On October 14 the Germans sank the "Royal Oak," a 29,150-ton dreadnought, at Scapa Flow. This ship was rated as one of the seven largest vessels in the British navy and the circumstances of its loss while within the waters of the naval base at Scapa Flow indicated remarkable daring on the part of the German submarine crew. Air raids at Scapa Flow on October 16 resulted in the loss of the "Iron Duke," a training vessel, and in damage to the "Southampton" and the "Mohawk." On November 18 Germany began an intensive mining campaign along the east coast of England. Reports indicated that mines were being laid from low-flying aircraft in the shallow coastal waters normally open to commercial shipping. The losses of merchant ships mounted considerably and on at least one day (November 25) the Thames estuary was closed to all shipping. On November 23 the "Rawalpindi," an armed merchantman, was attacked by a surface raider and sent to the bottom. On November 30 Germany claimed that 194 ships of all classes representing 736,000 tons had been destroyed. Early in the following month (December 4) Germany threatened to sow mines around the entire coast line of the

United Kingdom and to establish zones in which all shipping was forbidden under penalty of prompt destruction. On the surface, as the result of independent raider action, undersea, by mines and U-boat, and from the air by bombardment, Germany had prosecuted a vigorous and continuous naval warfare with increasing success.

On December 13 the "Admiral Graf Spee" was suddenly attacked off the South American coast by the "Exeter," the "Ajax," and the "Achilles" of the British navy. The action resulted in a running fight, ended when the German vessel put in to the Uruguayan harbour of Montevideo. The "Exeter" was reported severely damaged and withdrew from the action for repairs in the Falkland Islands. On December 17 the "Graf Spee" was scuttled by her own crew in the outer harbour of Montevideo and as the vessel hurred to the water's edge an accompanying ship took off Captain Langsdorff and his crew and took them to Buenos Aires. Three days later the captain of the scuttled ship was reported to be a suicide. The first important German naval engagement on the surface ended with considerable physical loss for Germany and world-wide speculation on the effect upon German prestige. The great German liner "Bremen" managed to run the British naval blockade after leaving the neutral port of Murmansk in Northern Russia and arrived in Germany safely. The liner "Columbus" after leaving Veracruz, Mexico, was scuttled by her own crew off the eastern coast of the United States and the survivors were brought to the harbour of New York city. At the close of the year the German naval efforts of all arms in the air, on and under the sea, had resulted in combined British and French losses of 16 men-of-war and a total of 233 Allied and neutral merchant ships. The total tonnage destroyed up to Dec. 31, 1939, is estimated at 785,485 tons. This represents an average loss of nearly two ships per day. German losses in naval craft included the spectacular destruction of the pocket battleship "Admiral Graf Spee" and an estimated total of 30-40 submarines. With the exception of the naval action off the South American coast, Allied naval attack against Germany was confined mainly to attacks by air. The greatest naval operations conducted by the Allies consisted in the persistent reduction of German imports (and after November 27) exports by means of the naval blockade. Britain claimed that nearly 900,000 tons of contraband had been seized and diverted from Germany and it appeared that the blockade would increase in effectiveness as the war continued.

Summary.—The Allied effort on the sea followed the traditional strategy imposed by limitations of geography and allowed by conditions of equipment, opponent and the necessity for obtaining maximum results with economical expenditure. The early institution of a strong naval blockade and the gradual completion of a convoy system combined to divert merchant shipping from the enemy and ensure uninterrupted ocean transport for the Allies. Minor success was gained as the result of air raids on German bases and submarine attack against isolated German craft. A considerable victory was gained in the destruction of the "Graf Spee," made more important due to the self-destruction of the vessel by the German crew and the consequent impairment of German naval prestige. At the close of the year Allied naval strength in Western Europe was under attack and losses had been suffered but the advantage appeared to rest with England and France.

German naval losses of all arms appeared relatively insignificant. Measured against these losses considerable success had resulted in following the traditional strategy of independent action by air, surface, and undersea attack. The mine-laying campaign had resulted in a spectacular if brief success and several exploits, notably the sinking of the "Royal Oak" at Scapa Flow, had reflected credit upon the naval forces. The effect of the loss of the "Graf Spee" on Germany is difficult to determine. Accepting that the German method is to calculate chances with methodical accuracy and, further, that the chances for success appeared infinitesimal it appears that self-destruction may be a logical deduction to arrive at. This deduction is not offered as a definition of the German view but appears to be one probable theory which might explain the decision made.

The German losses of submarines appeared high but not excessive considering the remarkable success secured by undersea action. German replacement of submarines is estimated by Germany to reach a total of 100 per month. Impartial observers suggest that 15 would represent a reasonable and realizable maximum. German air attacks on Allied shipping of all classes appeared more active and German losses not excessive considering the total number of actions and number of craft involved.

The growing losses of merchant shipping and the increased losses of contraband goods appear to be the most serious effect of Allied naval action

THE CLIMAX to the biggest naval battle of 1939 came December 17, when the German pocket battleship "Admiral Graf Spee" was blown up by her own commander off the harbour of Montevideo, four days after the ship was disabled in a running fight with three British cruisers

against Germany. How these losses will affect the economy of the German state cannot be determined over the short period of combat ending Dec. 1939. (See also BLOCKADE; SHIPPING, MERCHANT MARINE; SUBMARINE WARFARE.)

The War in the Air.—The great majority of people throughout the world expected the European war to open with a series of terrific air bombardments in all belligerent countries. At the close of the period (Dec. 31, 1939) no air attack on any great civilian centre had been made and the great air offensives appeared postponed. With the exception of the German air operations in the brief Polish campaign, the use of air attack against ships and bases in British waters, and the Russian bombardments in Finland marked the extent of the destructive use of the air arm.

Prior to Sept. 1, 1939, London, Berlin, Paris and the smaller belligerent cities conducted extensive and frequent black-outs as precautionary protective measures. Evacuation of children and invalids from large centres of population had been effected prior to the opening of hostilities. Air raid precautions in all large cities had become routine and complicated provisions for protection from bombs and gas were adopted in England and France particularly. It was commonly accepted that Germany had a superior air force and might launch an extended attack by air against the artificial defences of the west front, the centres of population in France and England, and the seaports and industrial life of both nations. Anti-aircraft installations were rushed to completion. Reserve forces were organized for anti-aircraft defence, balloon barrages, air nets; elaborate systems of air ground listening stations, provisions for fighter and interceptor planes, and other precautions were adopted as defence measures. In all nations and included in the reports of nearly all observers the threat of concentrated air attack appeared paramount and the first issue of the war.

The actual air operations included the following:

- (1) Extended and frequent reconnaissance by all belligerents over the frontier defences and coast line of the enemy.
- (2) Propaganda flights, particularly by the British, when leaflets were released explaining war aims and suggesting internal revolt.
- (3) Air attacks against merchant shipping, naval craft, naval bases, and seaplane installations particularly in England and infrequently along the German north coast.
- (4) Air operations in Poland. (See *German Campaign in Poland*.)
- (5) Air operations in Finland. (See *Russian Campaign in Finland*.)

On the German side the use of the air arm was confined almost exclusively to co-operative action with the naval effort against the Allied blockade. The long range bombing flights made frequent attacks against bases in the Firth of Forth and Scapa Flow, and were reported in attacks over the Shetland islands. Frequent air attacks were made against naval craft in the North sea. Mines were laid from low-flying aircraft along the coastal waters of

England. Combined with these operations, the Germans completed extensive air reconnaissance flights over England and released for publication photographs showing military targets at various harbours and bases along the Eastern coast. Air activity over the western front appeared to be confined to reconnaissance and observation flights. A few minor air engagements were reported the result of accidental rather than anticipated air combat. Observers have placed the grand total of air losses for all belligerents at 1,100–1,200 planes. Accepting that Germany employed more aircraft in a larger number of operations and would therefore suffer the larger proportional share of these losses, the total appears insignificant. Germany had ample air forces prior to September 1 and production rates would increase during the early months of the combat. Despite the success of the air arm as employed by Germany and regardless of losses or capacity for replacement, the German air force had not been seriously engaged in combat at the close of the year.

The Allies refrained from any extended use of the air arm during the period Sept.–Dec. 1939. The British air force made frequent long range observation flights over German territory. Pictures were taken of the western defence positions and some photographs of German naval bases and air installations were released to the public. Apparently the use of the air arm for propaganda purposes was considered important particularly by Britain. Reports were received of frequent flights made over Germany where large quantities of leaflets were dropped designed to incite unrest among the German readers. The results of this type of air employment appear indefinite. At least one air raid in force was reported against the German bases along the North coast, Heligoland and Sylt. These attacks were admitted or claimed and the results emphasized or ridiculed, dependent upon the source from which reports were released.

Little activity of French air forces was reported except for frequent observation flights over the western front. Occasional and minor air engagements enlivened the relative quiet.

Summary.—No belligerent initiated large scale air activities during the period Sept.–Dec. 1939. The development of aircraft and the improvement in air munitions and anti-aircraft devices indicated the lack of precedent or experience permitting the quick adoption of an air attack theory. Apparently air bombardment had far outstripped other air developments but fear of retaliation restrained leaders from early adoption of wholesale bomb raids. Full and continuous use of air observation was employed by all belligerents. Use of planes for propaganda was adopted with effects unknown. The employment of air attack against merchant ships and the use of light bombers against naval craft appeared to be the methods most regularly adopted by the German air forces. No belligerent had launched a major air effort at the close of the year. The strength of either side remained unimpaired. The probable future use of the air forces remained uncertain at the close of the year.

Russian Campaign in Finland.—Pre-Combat Phase—Oct. 7–Nov. 29, 1939.—On Oct. 7, 1939, the Russian Government requested that a delegation from Finland be sent to Moscow to open discussions for a non-aggression pact and adjustments of political and economic arrangements between the two countries. This action by Russia followed closely the completion of similar pacts made with Estonia, Latvia and Lithuania. These small states had agreed to accept Russian guarantees of assistance in the event of war, and in addition had permitted the occupation of important rail centres and coastal bases by Russian armed forces. The Russian invitation to Finland appeared to be an attempt to secure bases in Finnish territory and to acquire an extension of Russian control in the Baltic. The Finnish Government agreed to send a delegation for the purpose of examining Russian proposals, but announced publicly that Finland sought a peaceful solution of common problems and would not capitulate to Russian domination of Finnish independence. Immediate appeals for diplomatic assistance were made by Finland to her neighbours—Norway, Sweden and Denmark. The Government called military reserves to the colours and began a mobilization of some 250,000 men for "extraor-

dinary service" on Oct. 9, 1939. News reports from Leningrad indicated that approximately 500,000 Russian troops were concentrated in the vicinity of the Finnish frontier. Russian naval activity in the Baltic increased when Soviet warships began patrolling the Finnish southern coast line. A Finnish delegation arrived in Moscow to open discussions on October 11, while the Government in Helsinki warned the nation to be prepared for general mobilization and other precautionary measures in the event of emergency. A new "war of nerves" had opened along the northern front and world attention swung away from considerations of the Polish campaign and turned to follow developments in Finland.

The Russian-Finnish discussions were discontinued on October 16, when the Finnish delegation returned to Helsinki. It was announced that the Finnish delegation would return to Moscow at a later date. On October 18 the president of Finland, in a joint conference with the rulers of Sweden, Norway and Denmark, discussed mutual assistance in the event of emergency, and plans for joint action in preserving neutrality. The diplomatic observers, following the progress of this conference, estimated that peace in the Baltic states might not be maintained by joint action in the immediate future, but felt assured that the willingness to negotiate in an attempt to find peaceful solution might result in placing Russia in the rôle of aggressor in the event hostilities began. Meanwhile Finnish preparations for any eventuality continued. Air raid precautions were begun and the Government began collecting large stores of food stocks and other essential supplies for the army and for the civilian population. Unofficial sources stated that the Russian Government, among other demands, had insisted upon the occupation of three small Finnish islands adjacent to the Russian naval base at Kronstadt. Negotiations had been resumed between the Finnish and Russian delegations and the conferences continued to be held in secret, with only speculations as to the extent of Russian demands upon the small republic. On Oct. 27, 1939, Russian celebrations in commemoration of the October revolution of 1917 resulted in a postponement of conferences with the Finnish delegation. Diplomatic observers generally believed that this postponement would turn into an eventual stalemate and that the conferees would be unable to arrive at a peaceful solution. On November 13 the conferences ended and the fears of those observers who expected no concrete results were justified. A number of incidents, including the arrival of Russian planes over the Finnish frontier and several border incidents on the ground, began to intensify the Russian "war of nerves." Finnish efforts to improve her defences and to enter upon a complete emergency preparation basis were increased and the world began to recognize that Russia would probably begin the combat phase shortly. Proposals were made by the Finnish Government for resumption of peaceful negotiation on equal basis as an independent state. These proposals were rejected and Russia attempted to force immediate action and the acceptance of Soviet demands. Russia declared that the former Soviet-Finnish non-aggression pact was no longer effectual and that the increasing number of border incidents and other violations of neutrality would force Russian intervention.

On Nov. 30, 1939, Russian warships were reported enroute to the Finnish coast. Russian planes bombed Helsinki and the combat phase of the Russo-Finnish campaign began. On the same day Finland declared that a state of war existed although official sources in Moscow denied any knowledge of Soviet invasion of Finland.

On December 1, the Finnish Government resigned and a new cabinet was drafted with the governor of the Bank of Finland as head of the cabinet. The first activities of the Russian troops in crossing the Finnish frontier included welcoming Finnish peasants along the frontier and offering to set up an independent government under the protection of the Soviet. In the United States,

Mr. Roosevelt announced that "The present trend of force makes insecure the independent existence of nations in every continent and jeopardizes the rights of mankind to his own government." The "white war of nerves" had come to a close and the combat phase of the Russo-Finnish campaign had begun in real earnest.

Combat Phase — Russo-Finnish Campaign. — The Finnish scheme of manoeuvre was based primarily upon the system of interior communications, mainly rail but including a few excellent highways. The military definition of the Finnish scheme would be classified as a strategic defensive. Geographically the Finnish terrain is well suited for such a defence and with a scattered population the nation is admirably adapted for the pursuit of a wide-spread small but highly resistant series of defensive positions. Defence lines east of Viborg (Vüpur) are approached from the east through easily defensible passes. The character of the terrain renders continuous use of motorized and mechanized units unfavourable even during seasons of cold weather when the frozen marsh lands permit free movement. Innumerable lakes are a feature of the national terrain. Landing bases for an enemy are few in number and easily defended. The waters on the south skirt shallow harbours and even commercial shipping is considerably delayed in peacetime by the necessities of following devious channels into port. With recent improvements in rail and highway construction and with careful regard for the defence of the most probable avenues of invasion, Finland was prepared for prompt and strenuous defensive measures.

The general plan for Finnish defence included three main considerations:

(1) A principal defensive position in the fortified zone known as the Mannerheim Line across the land approaches through the Karelian isthmus in the south-east.

(2) Special field fortifications and improvised defence in the area north of Lake Ladoga in the vicinity of Tolvajärvi and Pitkaranta.

(3) Provisions for use of a strategic reserve force in central Finland and for support of the northern frontier in the vicinity of Petsamo.

The Finnish air force was assigned duties of observation behind frontier defences, short-range bombing tasks and shore patrol duty over the Gulf of Finland. The coast defence naval craft, including five submarines and two small battleships, were assigned harbour defence duties along the southern coast line.

The Russian Scheme of Manoeuvre.—The developments during the period closing on Dec. 31, 1939, indicate a general plan (see map: Sketch No. 1, p. 266) to invade Finland by land at three places:

(1) Across the Karelian isthmus, south of Lake Ladoga in the direction of Leningrad (Russia)—Viipuri (Finland).

(2) North of Lake Ladoga in the direction of Petrozavodsk (Russia)—Tolvajärvi and Pitkaranta (Finland).

a. In the Central Area—

(1) To the west in the direction of Kem (Russia)—Suomussalmi—Oulu (Finland).

b. In the North—

(1) South-west in the direction of Kandalaksha (Russia)—Kemi (Finland).

(2) To the south-west in the direction of Murmansk (Russia)—Kemi (Finland).

The use of air forces, particularly bombardment, and the employment of naval attack on Finnish ports along the Gulf of Finland were subordinate and included elements of the Russian scheme of manoeuvre.

Finnish Armed Forces.—Finland entered the campaign with three regular army active divisions, each approximating a total of 10,000 men. Preliminary mobilization had resulted in the expansion of this organization to a total of six divisions divided into three groups of two divisions each. In addition to these forces, Finland mobilized one cavalry brigade, five battalions of light infantry, no more than six independent batteries of heavy artillery, three battalions of coast artillery and one anti-aircraft regiment. Front line forces reached an estimated total of 125,000 men. In reserve, Finland counted upon six reserve divisions and the fron-

tier guard which consisted of about 5,000 men and were stationed along the eastern frontier. In addition to these reserves, Finland could call upon the civil guard for a total of close to 100,000 men.

Regular army.	125,000
Reserves (fully trained)	100,000
Frontier guards	5,000

Total.	230,000
Civil guard (local militia)	100,000

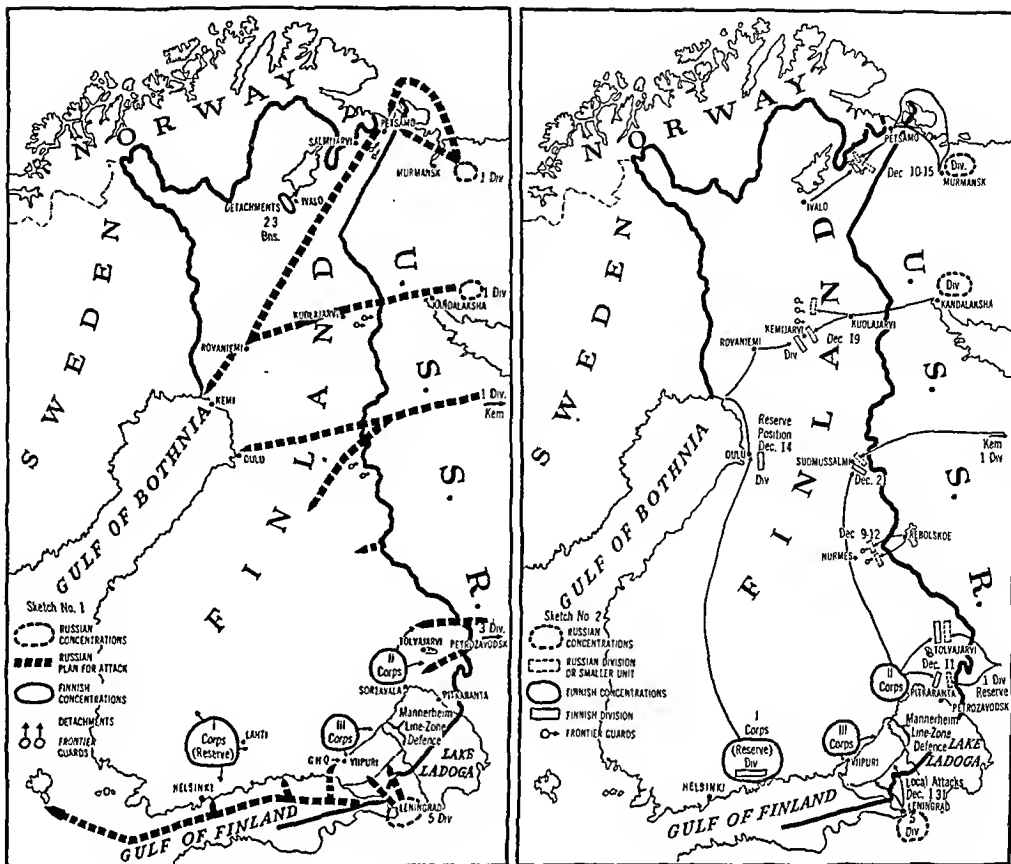

Grand Total—All Sources . 330,000

Russian Armed Forces.—No authentic figures had been released by the Russian Government describing the total and components of Russian forces. Composite estimates indicate that approximately 25 first line divisions, three to five cavalry divisions, six to seven tank brigades and considerable reserve divisions were available for the campaign in Finland. Equipment for first line troops was considered adequate, but large numbers of reserve divisions were indifferently equipped. Observers reported that the quality of equipment throughout the Russian components was generally considered no better than average. (See also *Russia*, p. 256.)

Dispositions of Forces: Finland.—Anticipating the outbreak of hostilities, the Finnish forces were divided into three groups, each of two divisions; general headquarters was located at Viipuri. II Corps was concentrated north of Lake Ladoga facing in the direction of probable Russian advance from Petrozavodsk. III Corps was concentrated in rear of the zone defence of the Mannerheim Line. I Corps was held in strategic reserve in the vicinity of Lahti. Small regular forces, not in excess of two to three battalions had been detached and sent to the vicinity of Petsamo to assist frontier guards. Along the Mannerheim Line defences reserve units had been concentrated as fortress troops. These dispositions permitted maximum freedom of action for the field army and concentrated the bulk of the striking forces in areas favourable for rail and road transportation over interior lines.

Dispositions of Forces: Russia.—The details of Russian troop dispositions were not clearly revealed. It appears that approximately one division was concentrated near Murmansk in the north. A second division was based upon Kandalaksha. A third was located at Kem. At least three divisions were located near Petrozavodsk and five divisions were concentrated north and east of Leningrad. Communication and supply units were disposed along the main rail line between Murmansk and Leningrad. These dispositions indicate the dependence upon a single railroad for communications and supply, with such assistance from Archangel and the White sea as weather conditions would permit for open water transportation. Inadequate rail and road facilities existed for large scale and continuous movements to the west in the direction of the eastern frontier of Finland.

Operations—Dec. 1-31, 1939—Russia.—Initial phase of the Russian attack consisted of demonstration in force against the Mannerheim Line along the Karelian isthmus, aerial bombardment of towns in the southern area and naval bombardment of

seaports along the southern coasts. After a week of reported attacks by air, by sea and by land, it became apparent that Finnish resistance had stiffened and that no early capitulation could be expected. (See map: Sketch No. 2.)

On December 8 advance elements of the Russian forces concentrated at Petrozavodsk, began to move to the west over the 70 miles intervening between the Russian railroad and the Finnish frontier. It appears that two divisions abreast were in this advance and a third division was held in reserve for the railroad. The Finnish II Corps moved to the north over a shorter distance and took position west and slightly south of Tolvajarvi; on December 11 the remaining II Corps, with two divisions, attacked the north (right wing) of the Russian force and divided the single division, driving the invaders to the east and over the frontier. Continuing the attack, the II Corps turned to the south and met the south (left) wing of the Russian advance and defeated the other single division in the area of Sortavala-Pitkaranta. Russian tank units were reported in difficulty along the north shore of Lake Ladoga, while in the north small Russian detachments had been halted in a frontier foray in the direction of Nurmes. Meanwhile Russian attack continued against the Mannerheim Line but appeared to be independent actions of small units including regimental operations designed to engage Finnish forces in that vicinity pending the development of major Russian attacks on other fronts.

In the north Russian detachments from Murmansk arrived by land, sea and air and attacked the seaport of Petsamo. Frontier guards defended the seaport but were unable to prevent larger forces from pushing beyond the town to the south-west in the direction of Salmijarvi-Ivalo. Before the Russian movement had gained considerable headway, the Frontier guards with the help of the local militia of civil guards and with the aid of a few battalions of regular troops met the Russian column in a major engagement. The Russian advance was checked and the invading

column was slowly turned back toward the coast and away from the major objective which had been the seaport of Kemi. In this area Russians had succeeded in capturing control of the narrow Finnish coast line and the port of Petsamo. The result of the action, however, was indecisive because the advance had been stopped far to the north of the objective.

On December 14 it became clear that advance Russian detachments were moving out of concentration areas at Kandalaksha and Kem in the direction of Kuolajarvi-Kemijarvi in the north, and Suomussalmi-Oulu in the central area. The columns from Kandalaksha consisted of an estimated strength of less than one-half of a division (two regiments of infantry with one regiment of artillery) moving slowly toward the two Finnish towns. Finnish civil guards took up a defence along the Kemi river while ski patrols of the frontier guards attacked the extended communication line of the Russian column. One division of the I Corps from the concentration area near Lahti was sent north by rail to the area Kemi-Oulu. The advance of Russian forces from the concentration at Kem appeared to be slower than the Russian advance to the north. The divisions of the I Corps of the Finnish forces moved swiftly to the north by rail from Oulu to Rovaniemi on December 19, continuing by rail to the vicinity of Kemijarvi where the Finnish forces met and defeated the Russian column in the area of Kemijarvi-Kuolajarvi. This engagement has been described as the battle of Salla, the second name given to the town of Kuolajarvi.

On December 20 the Russian advance in the direction of Kemi-Suomussalmi-Oulu approached the entrance to the town of Suomussalmi. The strength of these Russian forces is not definitely known but appears to have been close to a complete division. The II Corps of the Finnish army had been successful in the vicinity of Sortavala against Russian attacks north of Lake Ladoga. One division of the II Corps was sent north by rail via Nurmee to Hyrynsalmi with a mission of attacking the Russian forces in that vicinity. On December 21 the two forces met in the battle of Suomussalmi and the Finnish division defeated the Russian column. The action appears to have included practically a complete envelopment of the Russian troops and in combination with ski patrol raids made by the local militia, the regular Finnish forces cut off the Russian retreat to the east. Towards the close of the month, December 23-31, elements of the victorious division of the II Finnish Corps advanced in the direction of the Russian base at Repola. Scattered ski patrol raids by Finnish civil guards and frontier guards across the Russian border were reported.

Summary of Operations to Dec. 31, 1939.—The Russian campaign in Finland appeared to be immobilized on all fronts at the close of the year. In the north the Russian advances had been held up in the area of Salmijarvi-Ivalo where small Finnish forces including regular army detachments and local militia had succeeded in turning the invading columns away from their main objective. The concentration of Russian forces in Kandalaksha and in Kem had closed the frontier independently but had been defeated in turn by equal, if not superior, Finnish divisions. The Russian drive from the vicinity of Petrozavodsk had failed to penetrate the defensive north of Lake Ladoga and the Russian divisions were turned back from the frontier. Along the Karelian isthmus the independent attacks of Russian troops had been dissipated by unusual terrain and had developed into small unit attacks against the heavily fortified position defence of the Mannerheim Line. Russian air bombardment of the Finnish southern area had created considerable damage to towns and along railroad and seaport installations. The results had not weakened Finnish resistance and the lack of adequate bases combined with severe weather appeared to minimize the Russian air effort.

The disposition of the Finnish field forces and the reported use of these forces in major engagements suggested the following advantages:

(1) Disposition allowed freedom of movement of main field forces along favourable interior lines to meet major threats.

(2) Rapidity of movement permitted early engagement in favourable action where it appears that Finnish forces equalled or outnumbered opponents.

(3) Adequate reserves were continuously available behind main defence position (Mannerheim Line) to meet larger thrust from direction of Leningrad-Viipuri.

The close of the year found a determined Finland with high morale successfully defending along all frontiers. A small well organized force equipped with modern weapons and well led had met and defeated independently an invasion made by a larger power. The Russian forces had been unsuccessful in several attempts to develop co-ordination in land, air and naval attacks with the objective of securing an early and complete victory. The disposition and movements of the Russian forces suggested the following disadvantages:

(1) Inadequate communication for large scale simultaneous movements.

(2) Failure to concentrate forces behind the main efforts of independent columns.

(3) Lack of co-ordination between ground and air forces.

No official information was available from Russian sources for comment or clarification on the conduct of operations. Apparently Russian reserves were considered adequate in numbers but poorly equipped.

It must be emphasized that during the first month of this campaign official reports were numerous, confusing, frequently contradictory and almost entirely of Finnish or Scandinavian origin.

Exchange Equalization Account: see EXCHANGE STABILIZATION FUNDS.

Exchange Rates. Exchange rates were generally stable during the first eight months of 1939. For example, in only 13 of the 44 countries shown in the table on p. 268 was the average dollar value of the currency in June 1939 lower than in Dec. 1938; and in only five countries was it more than 1% lower: Netherlands and Netherlands Indies (2%), Rumania (4%), Brazil (12%), Peru (14%), and China (17%). This stability of the dollar value of most currencies does not mean that they were free from the pressure of adverse balances of payments. That such pressure was being exerted is indicated by the January-August flow of \$2,600,000,000 in gold to the United States, notably in March, May, and August and coming principally from the United Kingdom, the Netherlands, Belgium, Canada and Japan. But by these gold shipments and by other stabilizing and pegging devices, exchange rates were generally held firm.

European exchange rates were obliged, between Jan. and Aug. 1939, to combat flights of capital induced by repeated war scares. The Netherlands gulden was weakened throughout February as capital—particularly that of German refugees—fled the country in fear of German aggression. Strong support by the Exchange Fund was necessary to hold the gulden at 53 cents. This scare was followed by the German invasion of Prague during which European exchange rates were supported against the dollar only at the expense of heavy gold shipments. Political uncertainty in Belgium sent the belga to a large discount in the forward market during March and April until, as an expression of confidence in the new Government, capital was repatriated in May. Similarly, the gulden declined again in June and July as the Government resigned in the course of controversy over a spending program. Finally, as the cloud of the Polish crisis appeared on the horizon early in August and gathered intensity, only the most determined support prevented sharp exchange depreciation in most European countries. The pound sterling had been held at \$4.68 since February, although gold exports to the United States had been extremely large. With the sterling-dollar rate firm, the dollar rates of the Sterling Area currencies did not fluctuate. Toward the end of August, however, the British Exchange Equalization Account became virtually the only supplier of dollars in the London market and the premium on forward dollars increased. On August 25 the Account withdrew from the market, and the dollar was allowed to rise.

Before recounting the course of exchange rates following August 25, 1939, it is necessary to consider briefly the record of non-European rates up to that date. The United States dollar occupied a relatively passive position. There were no "gold scares" such as had contributed to dollar weakness during short periods in previous years. The excess of commodity exports over imports was only 60% as large as in the corresponding eight months of 1938 and wholesale prices had been very nearly stationary. In the Far East the major factor of disturbance continued to be the Chinese-Japanese War. Japan continued to lose gold, although the boom in raw silk prices materially aided her trade balance. But the yen was held firmly to sterling at a rate equivalent to slightly over 27 cents. The Shanghai dollar, less rigidly controlled, displayed conspicuous weakness. Until June its fluctuations were generally between 16 and 17 cents. But it then broke sharply to 13 cents and in July and early August declined further to a range between 7 and 8 cents. Actually, however, during the spring and summer the Japanese yen was being traded in Shanghai and North China at a dollar rate not much different from that of Shanghai

dollars. In February, for example, the yen could be bought in North China—illegally, of course—at about 16 cents, compared with the official pegged rate in Tokyo of 27 cents; and in May it was reported that on the Shanghai open market one United States dollar would buy 6.2 Shanghai dollars and 6.3 yen. The Canadian dollar was available in New York generally at less than 1% discount. But Latin-American exchanges—largely controlled by various forms of exchange rationing—were spotty. The Mexican peso was pegged at about 20 cents until July, when it dropped to 17 cents and fluctuated at that level until the outbreak of the European war. Here continued foreign trade difficulties arising in part out of the lack of a petroleum settlement were the principal factor. Farther south the most notable fluctuations occurred in the Brazilian milreis and the Peruvian sol. In April Brazil again set up a dual rate system, with a pegged official rate and a relatively uncontrolled free rate, thus ending the Bank of Brazil's monopoly of foreign exchange. The milreis declined in the free market until September. During the spring months the Peruvian sol declined 2.5 cents but recovered half its loss and was pegged at 19 cents between August and October.

The onrush of war in Europe late in Aug. 1939 inescapably brought with it a crisis in foreign exchange markets and instability in exchange rates. In contrast with the earlier months of 1939, a comparison of average dollar values in Sept. 1939 with those of June shows that in 33 of the 44 countries in the table currencies were weaker or, in the case of Germany and Poland, were not quoted. In 16 of these countries the average dollar value in September was 10% or more below the June level: United Kingdom, France, British Malaya, Australia, British India, Egypt, Hongkong, Iran, New Zealand, Siam and South Africa—all tied to sterling; and Greece, Uruguay, Canada, China and Japan. The decline of sterling brought immediate defections from the Sterling Area. Finland, Sweden and Norway cut the tie with sterling on Aug. 28 and 29, 1939. The Danish krone hesitantly followed sterling but apparently broke loose by September 7 after a depreciation of about 7% from the level of August 24. The official rate for the Argentine peso was depreciated about 5% in late October; but the so-called free (actually controlled) rate was apparently tied to the dollar, although it began to weaken slightly in December. Japan allowed the yen to follow sterling until about the middle of September, when it was about 15% below its August 24 dollar rate of 27 cents. Thereafter Japan began converting her sterling balances into dollars—contributing to the weakness of sterling in the New York market—and pegged the

yen to the dollar at 23.44 cents. Apparently the Japanese did not want to chance the increased cost of American goods which might result if sterling declined still further.

Meantime sterling and the currencies still tied to it had been fluctuating in New York at rates between 14% and 17% of the Aug. 24, 1939, level. As soon as war was declared, the United Kingdom, France, Canada and the other British Dominions imposed stringent exchange restrictions which made possible the rationing of available foreign exchange. The pound and franc were tied together at 176½ francs per pound and the British Government fixed the buying rate for the dollar at \$4.06 (later \$4.04) per pound and the selling rate at \$4.02. But dollars were available at this official rate only if the transaction in question was approved. In the New York market sterling was sold, usually at lower rates, by persons unable to obtain dollars at the official rate. The British Government had not, up to the middle of December, taken steps to eliminate this unofficial trading in sterling. The reichsmark was not quoted in New York after the first few days of Sept. 1939. But Germany's axis-partner, Italy, held the lira at 5.05 cents after a decline from 5.26 cents in September. In November the so-called benevolent lira, used for immigrant remittances and gifts to Italians, was reduced from 4.55 cents to 4.05 cents.

The neutral currencies in Europe were steady or strong after the outbreak of war. But as threats of German invasion of Belgium and the Netherlands were given credence the dollar value of

the belga and the gulden declined moderately in the spot market and moved to wide discounts in the forward market. After three weeks of war with Russia, Finland's finmark was available in New York on December 19 at the same rate which had prevailed before the outbreak of hostilities.

Outside of Europe exchange rates had not, up to the end of 1939, been seriously affected by the European war, except where tied to sterling. The shift of some pegged currencies from sterling to the United States dollar has been noted. The Canadian dollar, dropping below 90 cents, was being controlled both by exchange restrictions and by the use of New York balances. The Mexican peso moved up strongly to 21 cents during September but dropped back again in mid-December, apparently depressed by disappointing petroleum exports. The Latin-American exchanges generally remained close to the August level, despite loss of German, and disruption to other, export trade. The moderate improvement in commodity prices was a sustaining factor. But by mid-December the Peruvian sol and the Uruguayan peso had declined. The Japanese yen, as has been explained, ended the year tied rigidly to the dollar at a rate 14% below that of August 24. The Shanghai dollar, in contrast, moved more freely, and during the last quarter of 1939 it was relatively strong, buoyed by Japanese reverses in the war.

At the end of 1938 there was some reason to hope that during 1939 considerable progress might be made toward freeing foreign exchanges from blocking and rationing. But the outbreak of war in Europe inevitably resulted in a marked increase in the number of rigidly controlled exchange rates. Belligerent powers find it necessary to husband their foreign currency resources; and neutral countries, faced by serious dislocation in foreign trade, can scarcely avoid expanding the scope of their exchange control. The import needs of the belligerents together with the course of foreign trade will determine whether year-end dollar rates of the major foreign currencies can be maintained. (See also GOLD RESERVES AND GOLD STANDARD.)

Exchange Stabilization Funds. Exchange stabilization funds, scarcely recovered from the strain imposed by the Czech crisis, had to offset a flight to the dollar during the Prague invasion in the spring of 1939 which provoked the flow of some \$700,000,000 of gold to the United States. Most exchange rates, however, were held stable by the determined operation of exchange funds.

The resources of the British Exchange Equalization Account were replenished on January 6 by its purchase from the Bank of England of gold then worth £350,000,000. Thus strengthened, the Account held sterling at about \$4.68 until late in August. In the spring and again in early summer the Dutch fund was obliged to intervene on a large scale to support the guilder, losing at least 300,000,000 guilders in gold. During the first seven months of 1939 the French fund was aided by continued improvement in domestic political and economic affairs. The resulting capital repatriation permitted the transfer of gold from the fund to the Bank of France for the first time since Nov. 1937.

Meantime, elsewhere in the world there had been no startling change in the use and condition of exchange stabilization funds. Early in January President Roosevelt requested continuation of the United States fund until Jan. 15, 1941. In the course of Congressional hearings on the subject it was revealed that the fund, since its establishment, had earned \$12,000,000 (increased by June 15 to \$15,000,000) and still had its original \$2,000,000,000 intact—all but about 10% of it in gold. Secretary Morgenthau assured Congress that the fund would not be used to finance arms

purchases by foreigners or to support the market for United States bonds. He also stated that, with rare exceptions, the fund does not operate in foreign currencies. That is, the Treasury does not normally take an uncollateralized foreign exchange position.

In three countries new exchange funds were set up during 1939. One was China, where a sterling credit was utilized to provide intermittent support for the Shanghai dollar. The second was Cuba, which in June announced the establishment of a national currency stabilization fund with United States dollar resources to be obtained at par from exporters. However, this exchange fund presumably marks no departure from the dollar exchange standard on which Cuba has operated. The third country was Brazil, which in October announced that it was buying \$3,000,000 in gold from the United States Treasury under an agreement made in 1937, to form the nucleus of an exchange fund.

The relative calm in international finance from May until August was apparently utilized by exchange funds to build up their dollar resources in preparation for future difficulties. By the end of August more than \$1,100,000,000 in gold was earmarked for foreign account by the Federal Reserve banks, and foreign central bank deposits in New York totalled about \$400,000,000. But with the onset of Polish-German friction, a renewed flight of capital to the United States began. Sterling, for example, demanded increasingly heavy support from the exchange account during August, and by the 25th the account stopped supplying dollars and allowed sterling to decline. On September 6, the remaining gold in the Bank of England was transferred to the exchange account.

Under war conditions European exchange fund operations have necessarily been modified. Except for the currencies of the British Dominions and the French franc, the sterling area has largely been replaced by a dollar area in which exchange stabilization operations consist principally of pegging through the medium of dollar resources. The pound sterling itself is pegged to the dollar primarily by means of exchange rationing and the exchange account is apparently giving little or no attention to the unofficial "free" sterling rate in New York. With private gold export rigorously controlled and all official gold reserves concentrated in the exchange account, the effect of gold outflow on England's domestic economy is no longer a problem. The French franc is also under wartime control, and, with the sterling-franc rate pegged at 176½ francs to the pound, both countries are virtually on a dollar exchange standard. In both countries the wartime problem is one of husbanding and rationing foreign, especially dollar, reserves by every device necessary.

The United States Exchange Fund apparently did not support foreign currencies during the Polish crisis. Whether after European hostilities began the fund was active is not publicly known; but in mid-September the Secretary of the Treasury announced that the Tripartite Agreement was still in force and that its principle of co-operation was still being observed. (See also EXCHANGE RATES; GOLD RESERVES AND GOLD STANDARD.)

Exhibitions and Fairs: see FAIRS AND EXHIBITIONS.

Exploration and Discovery. Arctic. — U.S.S.R.: The Arctic work of the Soviet Union continues to surpass in extent and variety that done by other nations. It rests on a broad program of economic and strategic development. Varied and careful scientific studies contribute to the same ends, as well as to those of pure science.

Eleven freighters completed the Northeast Passage the season

of 1939, while sections of the passage were traversed by 104 vessels, carrying freight to settlements, ports, and scientific stations along the Arctic coast of Siberia and on the islands to the north. The freighters were accompanied by ice-breakers, and air reconnaissance of ice conditions along the route was considerably increased. Additional beacons, navigation lights and channel markers were placed. Fifty different kinds of new charts and sailing directions for the Kara sea and several other sections of the Northern Sea Route have been issued. Settlements along the route continue to flourish. Arctic ports are being equipped at Dickson island and at Tixie bay.

Igarka, 300 miles south from the mouth of the Yenisei river, though 50 miles north of the Arctic Circle, has grown in ten years from some hundreds to more than 15,000 people. Work has begun for a modern port at Providence bay on the Chukotsk peninsula, across from Alaska.

The Chief Administration of the Northern Sea Route continues to organize fuel bases at the principal coal and oil deposits within the Arctic. Most of the northern fleet now uses Arctic coal. An important new fuel centre is in the basin of the Pechora river beyond the Circle. To speed up transportation of this coal and oil, a railway crossing the eastern part of the Archangel region is under construction.

The ice-breaker "Sedov," which was caught in the ice of the Laptev sea in Oct. 1937, is on its third winter's drift. The crew are in good health and busy carrying on the program of meteorological, oceanographic and other studies. In February and again in March the "Sedov" surpassed the record of 85° 57' N. which Nansen's "Fram" established in Oct. 1895, for the most northerly drift of a ship. An all-time record was established on August 31 when the "Sedov" reached 86° 40' N., 47° 55' E. On December 7 the ship was at about 83° N., 5° 37' E. When near 86½° N., 39° E., a sounding line of 5,180 metres was paid out without reaching bottom; other soundings in the vicinity indicated depths exceeding 5,000 metres.

Perhaps the outstanding single 1939 achievement in Soviet exploratory aviation was the flight of M. V. Vodopyanov over the Kara sea on May 24, about 3,700 miles. The plane sprayed the ice beneath with paint, so that on later flights the speed and direction of the drift could be determined. The regular northern air services were continued; Soviet pilots flew more than 1,000,000 miles within the Arctic during 1939. Airports with wireless have been established at Anadyr, Cape Schmidt, and other spots on the Chukotsk peninsula. The scientific work of the 57 Arctic scientific stations was continued.

Alaska: Contracts were let by the Navy and work was commenced on naval air stations at Kodiak and Sitka, the two bases to cost an estimated total of \$13,000,000. There is a \$4,000,000 Army air base development at Fairbanks which will be used as a cold weather experimental field.

The work of the Alaska branch of the Geological Survey included: mapping the east-central part of the Alaska range, principally between Delta and Johnson rivers; geological surveys in the northwestern part of Chichagof island, southern Alaska; in-

vestigation of potential tin fields of western Seward peninsula; topographic surveys in the Porcupine river district from Fort Yukon to the Canadian boundary; revision of much of the early exploratory mapping between Nabesna and Chisana rivers, near the head of Tanana river; investigation of mineral resources and of new mining developments.

An expedition from the University of Alaska and the American Museum of Natural History did archaeological work near Point Hope. The finds were "the least Eskimo" of anything so far unearthed in the Arctic. Preliminary study is said to indicate these collections represent the oldest culture yet found in the Arctic.

Work by Americans included the 15th Arctic voyage of R. A. Bartlett, with a farthest north of 77° 18' N. off the northeast coast of Greenland. D. B. MacMillan made his 18th Arctic voyage, this time Labrador, Baffin island, and along the west coast of Greenland. The University of Minnesota botanical expedition to Hudson Bay spent the summer exploring, particularly the Richmond Gulf area and the Belcher islands. An American Geographical Society party, led by Walter A. Wood, completed an aerial survey of 2,000 sq.mi. in the St. Elias mountain range, Yukon Territory. Mr. and Mrs. A. L. Wasburn completed their second summer's geological work on Victoria island, using aeroplane transport.

Canada: The Government's annual Eastern Arctic patrol covered 10,600 mi. of northern waters aboard the Hudson's Bay Company ship "Nascopie." Members of the patrol included scientists and technical officers of the Canadian Government, other scientific observers, a detachment of Royal Canadian Mounted Police, and tourists. The expedition called at 22 posts, leaving supplies, mail, and new personnel.

In the Canadian Arctic and sub-Arctic the aeroplane continues gaining importance. During 1939 the Royal Canadian Mounted Police introduced its own aircraft for inspection and patrol duty. Air inspection visits to many of the northern posts were made by officers of the Hudson's Bay Company. Private aviation companies have regularly scheduled flights, both summer and winter, to Aklavik, Coppermine and other Arctic points; a further number of unscheduled trips were made to such places as Cambridge bay and Reed island, taking in scientists, bringing out traders with their fur, etc.

While there has been as yet no mineral production on a commercial scale north of the Arctic Circle in the Canadian sector, there was steady progress in Canada's radium industry on the edge of the Circle, where the world's richest pitchblende ore is being mined at Great Bear lake; the production of radium has passed the 100-gram mark, with a substantial return from uranium oxide and other minerals.

The Canadian Government's reindeer herd on the Mackenzie delta now numbers 4,146. A band of 900 which was separated from the main herd and driven eastward in Dec. 1938, has been established in the Anderson valley under native management; there was a satisfactory fawn crop, with the Aug. 1939, round-up showing 1,196 animals.

Richard Finnie, Canadian Arctic student who has been making a motion picture record of life and progress throughout the Northwest Territories over a period of 11 years, continued his work in the summer of 1939 in the Mackenzie district.

The Vicomte Gontran de Poncins, French anthropologist, spent the winter of 1938-39 between King William island and Pelly bay studying the primitive Eskimo groups in that area. Excavations made in Foxe basin by Graham Rowley, British archaeologist, are said to indicate that the Cape Dorset Eskimo culture is distinct

SCIENTISTS of the German Antarctic expedition landing on an ice floe in Jan. 1939. In April the expedition claimed 230,000 sq.mi. of territory previously explored by Norway

from and earlier than the Thule culture in the Eastern Canadian Arctic.

British activity fell off sharply, even before the outbreak of war. An expedition from St. Andrews university did geological work in Ubekendt island and Upernivik island, off the coast of West Greenland.

Norway is active in the exploitation and development of the portion of East Greenland where she has special privileges. Yearly scientific expeditions are sent out by Norges Svalbard-og Ishavs-Undersøkelser to this section and to Spitsbergen and Bear island. Private expeditions are constantly in the field, particularly hunters and trappers maintained in East Greenland by the stock company Arktisk Næringsdrift A/S.

The Norwegian Fisheries Board investigated the waters about Bear island and off the west and north coasts of Spitsbergen. At Ny-Aalesund in King's bay, lat. 79° N., there has been established a hotel, with all ordinary modern comforts, including a wireless station and a doctor. The hotel was open during July and August but is designed for year-round accommodation.

Sweden: Professor Hans Ahlmann and two assistants established a base for the study of glacial economy on Clavering island, Northeast Greenland; the leader and one assistant returned in the fall, while the third member of the party is carrying the work through the winter.

A Danish expedition of five men, under the leadership of J. van Hauen, is working in the Thule district of Northwest Greenland and on Ellesmere island. With the aid of Eskimos, extensive spring sledge journeys are planned; collections of geological and zoological specimens will be made, and a study of the migration routes of the Ellesmere reindeer. N. Chr. Rasmussen (son of the famous Knud Rasmussen), the expedition's photographer, will film the party's activities.

Two Danish hunters attempted a spring sledge journey around the north of Greenland, from Walrus point on the east coast to Thule on the west, both in about $76^{\circ} 50'$ N. lat. The trip of about 3,000 mi., which would have required one or more years to complete, was planned for the purpose of further exploration of the valleys south of Peary Land. But at 81° N. the travellers were forced to turn back, due to open water and loss of several dogs.

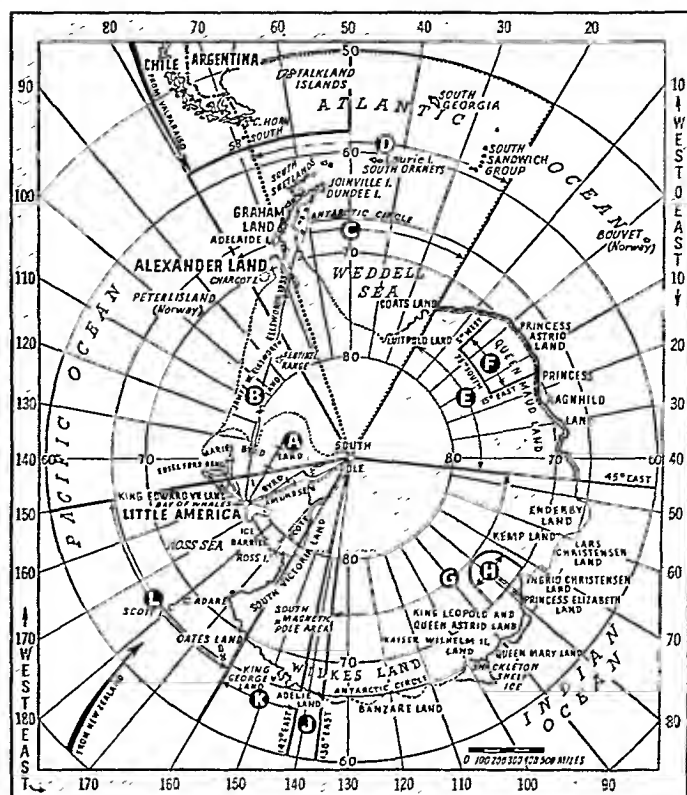

During the summer a number of individual Danes carried on scientific work of various sorts in widely separated places—among them Richard Bögvad, geological research at Ivigtut; C. L. Vebaek and one companion, archaeological studies of old Norse settlements; P. O. Pedersen and two assistants, dental studies. One of Dr. Pedersen's conclusions is that tooth decay (caries) either does not occur or is extremely rare, whether among Europeans or Eskimos, when they are living on a nearly or quite carnivorous diet.

Information is lacking on the 1939 work of the Danish North-East Greenland expedition 1938-39, the Norwegian-French expedition to Northeast Greenland 1938-40, and the French expedition to West Greenland 1938-39.

Antarctic.—With growing realization that all lands, wherever located, are valuable for potential resources or for strategic position, there was during 1939 a rush by many nations to reiterate claims to Antarctic territory or to make new ones. Official British and French declarations of sovereignty over Antarctic areas have long been on record.

Among the nations putting forward claims, officially or unofficially, during 1939, have been Argentina, Germany, Japan, Norway and the United States. Other possible claimants are the Soviet Union and Sweden.

The issues are confused by the overlapping of various claims. British declarations cover three large sectors, wedges extending

CLAIMS MADE ON THE ANTARCTIC CONTINENT up to Dec. 31, 1939: (A) Marie Byrd Land, claimed for United States by Admiral Richard E. Byrd, 1928-30 and 1933-35; (B) James W. Ellsworth Land, claimed for United States by Lincoln Ellsworth in 1935; (C) Falkland Islands dependency claim, by Great Britain, 1908 and 1917; (D) Argentina's claim, 1939; (E) Norway's claim, 1939; (F) German claim expected because of aerial mapping, 1939 (later reports give the boundaries of German claim as 14° W. and 20° E. Long.); (G) and (K) Australian Antarctic territory claim, by Great Britain, 1933; (H) claimed for United States by Ellsworth in proclamation dropped from the air, Jan. 1939; (J) claimed by France, 1938; (L) Ross dependency claim, Great Britain, 1923. The new Byrd expedition will do its major work between 80° and 150° W. Long., in the sector including (A) and (B). No country has yet formally claimed this sector.

to the South Pole, which are known as the Falkland Islands Dependencies, Ross Dependency of New Zealand, and Australian Antarctic Territory.

The French claim, Adelie Land, is a wedge that lies wholly within the Australian sector.

By a royal decree of Jan. 14, 1939, Norway showed her respect for the British boundaries and at the same time asserted her own rights when she laid claim to "That part of the mainland coast in the Antarctic extending from the limits of the Falkland Islands Dependencies in the West (the boundary of Coats Land) to the limits of the Australian Antarctic Dependency in the East (45° E. Long.) with the land lying within this coast and the enviroing sea . . .", about one-fifth of the whole Antarctic circumference.

Argentina says she has never recognized British sovereignty of the Falkland islands.

During 1939 unofficial claims were made in her press to everything in the Antarctic regions between 20° and 68° W. Long., which includes the South Orkneys, South Georgia, South Shetlands, Graham Land and all other islands in the Weddell sea previously claimed by Britain. These claims were based on the contention that this territory is a natural geographic dependency of the South American continent (and therefore of Argentina), and further that Argentina is the only country that has ever maintained true occupation in the Antarctic—having had a meteorological and magnetic observatory on Laurie island in the South Orkneys since 1904.

A GIGANTIC SNOW CRUISER was constructed in 1939 at Chicago for Richard E. Byrd's Antarctic expedition

Upon the return in April of the German Antarctic expedition (see below), a German sphere of influence was unofficially claimed for the territory observed, more than 230,000 sq.mi., all of it within the section claimed by Norway.

The claims of the United States have never been officially stated, but apparently may comprise roughly the sector lying between the Ross Dependency and the Falkland Dependency (between 80° and 150° W. Long.). These claims would rest primarily on the exploratory work of Byrd and Ellsworth; but there are older claims, based chiefly on Wilkes and Palmer, which lie within territory covered by British dependencies. In 1924 Secretary Hughes expressed the viewpoint of the Department of State that settlement, in addition to discovery, is necessary for establishing sovereignty in polar regions.

Discovery Research Committee: In May the British "Discovery II" returned from her fifth Antarctic commission, mainly oceanographic and hydrological. During the early part of the year she had continued her series of cruises over the prescribed route along the meridians of Greenwich and 20° E. and then along the edge of the pack between these meridians. As the summer advanced, higher latitudes were attained; the last two cruises reached the slope of the Antarctic continental shelf.

German Antarctic Expedition, 1938-39: The "Schwabenland," Captain Alfred Ritscher, sailed for the Antarctic in Dec. 1938, and returned in April 1939. A catapult ship, she carried two Dornier Wal 10-ton flying boats, their pilots, and a staff of scientists. The territory explored lies between 14° W. Long. and 20° E. Long. During 86½ flying hours 231,660 sq.mi. were observed, of which about 135,000 sq.mi. were photogrammetrically mapped. The

southernmost point observed from the air was about 76° S. on the Greenwich meridian.

Ellsworth Expedition: In Lincoln Ellsworth's American expedition of 1938-39 the most southerly point was reached on the flight of Jan. 11, 1939, when Ellsworth and his pilot, J. H. Lyburner, flew to about 72° S. on the meridian of 79° E. A cylinder was dropped containing a paper claiming for the United States about 80,000 sq.mi. of territory covered by the flight.

The United States Antarctic Service: Upon the appropriation of funds by Congress for an Antarctic investigation and survey, President Roosevelt named Rear Admiral Richard E. Byrd its chief. On July 20 a new governmental agency to supervise the work was formed, to be known as the United States Antarctic Service, which is directed by an inter-departmental executive committee, and is under the fiscal supervision of the Department of the Interior. Two ships were assigned to the Service, the "Bear," veteran of previous expeditions both Arctic and Antarctic, and the "North Star." Both had previously been in the Alaska service. The "Bear" for the Coast Guard (Treasury) and the "North Star" for the Department of the Interior. The "Bear" has now been commissioned as a naval vessel of the U.S. The "North Star" sailed from Philadelphia on November 21, and the "Bear" from Norfolk on November 26. There will be two posts, the East base under Richard B. Black, and the West base under Paul A. Siple, both experienced Antarctic men. The West base will be at or near Byrd's old base, Little America, while the other will be placed some hundreds of miles to the east.

The Service is equipped with four aeroplanes, a huge motorized snow cruiser, two Army tanks (stripped of armour and equipped with driver's cabs), dogs and sledges, radio, and other scientific equipment of various sorts. The objectives of the Service were announced as three-fold: (1) To make a survey and investigation of the land and sea areas of the Antarctic regions preparatory to the possible assertion of claims to sovereignty; (2) to map the (c. 1,000mi.) coastline between the two base camps; (3) to carry out a program of scientific research laid down by the National Research Council which will include investigations in geology, oceanography, meteorology, seismology, physics.

If sufficient appropriations are made by Congress, it is planned to continue the project over a period of three or four years, with any required changes in personnel and delivery of supplies annually.

Whaling Operations: During the 1938-39 season 34 factory ships, 2 shore stations and 281 catchers were engaged in Antarctic whaling. There were 12,705 active men, an increase of 1,478 over the 1937-38 figure. The "legal" pelagic whaling season, December 8 to March 7, was observed by all nations except the Japanese. Preliminary reports give oil production for the season at 2,813,546bbl. (less than the 1937-38 output), divided among the nations as follows: Great Britain, 887,596bbl.; Norway, 721,721; Germany, 492,339; Japan, 483,714; United States, 91,300; Panama, 69,050; Argentina, 66,826. Total number of whales killed was 38,321, of the following kinds: blue, 14,059; fin, 20,788; sperm, 2,591; other species, 883. (See also NATIONAL GEOGRAPHIC SOCIETY.) (V. S.)

Export-Import Bank of Washington.

The Export-Import Bank of Washington is an agency of the United States established to aid in financing and to facilitate exports and imports and the exchange of commodities between the United States and foreign countries or the agencies and nationals thereof. By Public Act No. 3, approved March 4, 1939, the 76th Congress extended the life of the Bank from June 30, 1939, to June 30, 1941, or such earlier date as the President of the United

States may fix by Executive order. The activities of the Bank increased during 1939, but were confined, as theretofore, largely to three major fields. The Bank established credits in connection with the exportation of agricultural products where facilities were not readily available through private financial institutions. In this field the Bank assisted in the sale of American raw cotton to foreign spinners and dealers by establishing, through American commercial banks, lines of credit available to American cotton shippers and guaranteed by leading banks in the countries of the purchasers. The Bank extended credits directly to American firms desiring to export industrial products, particularly heavy machinery, electrical and railway equipment. It was the practice of the Bank to offer credit terms approaching those available to the exporter's foreign competitors and in some cases the Bank assumed a portion of the risk without recourse to the American manufacturer or exporter. These transactions were accomplished usually through the discounting of obligations of the foreign purchaser endorsed or otherwise guaranteed by a sound foreign bank or, in some instances, by a foreign government.

The Bank established lines of credit up to \$20,000 each to individual firms which were experienced and of good repute but which were hampered by lack of capital in obtaining accommodations from private sources. It was the practice of the Bank to designate a commercial institution to handle such an account as agent of the Export-Import Bank of Washington. The credits were revolving and were available to the exporter upon presentation, for discount by the agent bank, of short-term drafts on approved foreign purchasers.

In addition to the above, the Bank made credits available to a number of leading Latin American banks to make dollar exchange available exclusively for the purpose of meeting promptly obligations to American exporters. The Bank specifically agreed to co-operate with several South and Central American countries and with American manufacturers and exporters in arranging for the financing in the United States of materials and equipment required for projects designed to improve the economic conditions of the countries and their trade with the United States.

From the time of its establishment to June 30, 1939, the end of the fiscal year 1939, the Bank had made commitments totalling \$250,758,547.38, of which \$100,885,381.06 had been cancelled because the interested American manufacturers failed either to obtain the foreign business or to meet the Bank's conditions. Actual disbursements amounted to \$94,872,971.21, of which \$41,319,274.86 had been repaid, leaving total loans outstanding at \$53,553,696.35. Net profit for the fiscal year 1939 was \$1,744,630.74.

(W. L. Pr.)

Exports and Imports. The following table shows exports, imports, and balance of trade of the United States for recent years.

Year	Merchandise		Excess of exports (+) or imports (-)		
	Total Exports*	General Imports	Merchandise	Gold	Silver
		(All figures in millions of dollars)	in millions	of dollars	
1929	5,241	4,399	+ 842	- 175	+ 19
1933	1,675	1,455	+ 220	+ 173	- 41
1934	2,133	1,655	+ 478	- 1,134	- 86
1935	2,283	2,047	+ 235	- 1,739	- 336
1936	2,456	2,423	+ 33	- 1,117	- 171
1937	3,349	3,084	+ 265	- 1,586	- 80
1938	3,994	1,960	+ 1,134	- 1,974	- 223
1938 (11 months)	2,825	1,780	+ 1,036	- 1,733	- 203
1939 (11 months)	2,810	2,071	+ 739	- 3,123	- 68

*Re-exports of imported merchandise are included.

After having reached in 1937 the highest figure since 1930, the value of United States exports in 1938 declined 7%, although the

INDEXES OF CHANGES in quantity, unit value (price) and total value of exports of United States merchandise, and imports for consumption, by quarters, 1929-39. Data for the fourth quarter of 1939 is partly estimated. Import indexes prior to 1934 are based upon "general imports"

volume was slightly larger. In the first 11 months of 1939 the value of exports was less than 1% below the value for the corresponding period of 1938. Total exports, including re-exports, were only 1/2% smaller. The volume of exports was slightly higher in 1939, the decrease in value being due to the lower prices prevailing in the first eight months of the year. A feature of the export trade was the marked decrease in exports of grain. In contrast, the volume of cotton exports, relatively small during the first seven months of 1939, increased in the later months, and the total volume for the 11 months was only 5% less. The war probably increased the exports of cotton and a few other products but reduced the exports of tobacco, fresh fruits, and some other agricultural products. Exports of manufactures and semi-manufactures were valued at \$2,014,000,000 in the first 11 months of 1939 as against \$1,841,000,000 in the corresponding period of 1938 and \$2,088,000,000 in 1937. There were large increases in the value of the exports of steel products, aluminium, metal-working machinery, aircraft, chemicals, rubber manufactures, cotton manufactures and other. Exports of automobiles declined about \$12,000,000.

United States imports for consumption during the first 11 months of 1939 were about 13% larger in volume and 15% larger in value than in 1938. Prices averaged about the same as in 1938, although certain import commodities rose in price after the outbreak of the war. Increased industrial activity resulted in an expansion of the imports of crude materials and semi-manufactures which accounted for about four-fifths of the rise in the value of total imports. Imports of crude materials increased 17% in volume and 26% in value; imports of semi-manufactures increased 25% and 23%, respectively. Imports of finished manufactures increased \$21,000,000 in value, newsprint paper alone accounting for \$13,500,000 of the increase. The value of total general imports for the first 11 months of 1939 was 15.7% above the corresponding period of 1938, but nearly 28% below the high total of 1937.

EXPORTS AND IMPORTS

United Kingdom.—The higher average price level, rearmament activity and the general improvement in world economic conditions in 1937 resulted in an increase in British trade of more than 20% over 1936, bringing the total to the highest level since 1929. Industrial activity slackened in 1938, the British general index declining from 132.8 in 1937 to 124.1 in 1938, and the value of foreign trade decreased 10.6%, but was still higher than in any other year since 1930. A summary of foreign trade follows:

Year	Total Imports (£ 1,000)	Exports of United Kingdom Goods (£ 1,000)	Exports of Imported Merchandise (£ 1,000)
1929	1,220,765	729,349	109,702
1933	675,016	367,909	49,081
1934	731,414	395,986	51,243
1935	756,937	425,921	55,266
1936	847,752	440,605	60,769
1937	1,027,824	521,391	75,134
1938	919,509	470,755	61,525
1938 (10 months) . .	769,543	389,165	51,725
1939 (10 months) . .	717,275	367,324	40,682

In the first eight months of 1939 British trade was still approximately at the level of 1938, imports having declined by only 1.6%, while exports of British goods increased 2.2%. In Sept. 1939 both imports and exports suffered a serious decline; in October imports rose again, while exports increased only slightly. The total decrease for the 10 months amounted to £52,268,000 or 6.8% for imports and £27,841,000 or 7.1% for British exports. In the imports for the 10 months the principal decreases were in foodstuffs (chiefly grain and flour), tobacco, rubber, wood, manufactures of non-ferrous metals, hides and skins, cotton, iron ore and scrap. Imports of manufactured articles increased £900,000, due chiefly to the higher values of imports of machinery, chemicals, vegetable textiles other than cotton, leather and manufactures, and iron. British exports of foodstuffs and raw materials declined slightly, but there was a decrease of £24,896,000 in exports of manufactures. Machinery and iron and steel accounted for more than a half of the total drop, the other chief declines being in vehicles, cotton manufactures, electrical apparatus, and woollen manufactures. Exports of non-ferrous metals, coke, vegetable textiles other than cotton, and leather were larger. Since September a new form of economic control has been in force, exercised partly by the Government and partly by the interested industrial groups, usually with the view to promoting exports as payments for the necessary imports.

Germany.—Foreign trade values in recent years for old and new Germany are summarized in the table at the top of the next column.

In the first half of 1939 nearly 40% of German trade was done with nine countries: Italy, Netherlands, the United Kingdom, Sweden, the United States, Hungary, Denmark, Belgium and Switzerland, in the order named. Imports from Rumania, Yugoslavia and Bulgaria totalled 182,064,000 marks, 6.6% of the total. Imports from Rumania were valued at 85,868,000 marks, 3.1% of the total, one-third of value being represented by 386,178 metric tons of refined mineral oils, and another third by lumber, maize, crude petroleum, barley and wheat. Trade with the Soviet Union was less than one-half of 1% of the total.

Trade for the first seven months of 1939 showed a decrease of 7.6% in imports and an increase of less than 1% in exports. Imports of wheat, rye and maize were greatly reduced, but there were large increases in imports of cotton, rubber, mineral oils, iron ores and tin. Exports of semi-manufactures of iron increased from 1,196,798 to 1,319,774 tons; exports of advanced iron manufactures and machinery were about the same as in 1938, while exports of aircraft and automotive vehicles increased 13,140 tons in quantity and 21,625,000 marks in value.

The Anglo-French blockade isolated Germany from countries

Foreign Trade Values in Germany

Year	Imports (Rm. 1,000,000)	Exports (Rm. 1,000,000)	Excess of imports (—) or exports (+) (Rm. 1,000,000)
1929	13,446.8	13,482.7	+ 35.9
1933	4,203.6	4,871.4	+ 667.8
1934	4,451.0	4,166.9	— 284.1
1935	4,158.7	4,269.7	+ 111.0
1936	4,217.9	4,786.2	+ 550.3
1937	5,468.4	5,911.0	+ 442.6
1938	5,449.3	5,256.9	— 192.4
"Greater Germany"*	6,051.7	5,619.1	— 432.6
1938 (7 months) . .	3,456.8	3,282.3	— 174.5
1939 (7 months) . .	3,194.3	3,314.5	+ 120.2

*Trade of Germany and Austria, combined, with other countries. Beginning with Oct. 1938, the trade of the Sudeten districts is also included, and since April 1, 1939, also the trade of Memel. The trade of Bohemia and Moravia is not included.

which supplied over 50% of her imports in the first half of 1939. Strenuous efforts were made to increase trade with the neutral countries, and though war supplies have the first claim on materials, exports goods are second. Trade with the Balkan countries appeared to be hampered by transportation difficulties.

France.—The following table shows the value of French foreign trade during recent years (the depreciation of the franc has made it advisable to show statistics both in actual currency values and in gold dollars):

(All figures in millions)

Year	Imports		Exports	
	Francs	Dollars	Francs	Dollars
1929	58,221	2,282	50,139	1,965
1933	28,431	1,114	18,474	724
1934	23,097	905	17,850	700
1935	20,974	822	15,496	607
1936	25,414	898	15,492	548
1937	42,391	1,005	23,938	566
1938	45,981	788	30,586	520
1938 (8 months) . .	30,492	539	18,706	331
1939 (8 months) . .	32,539	508	23,832	372

The unsettlement of internal financial, social and general economic conditions in France affected the foreign trade to an unusual degree in recent years. When industrial production slackened in most countries in the last months of 1937, however, the depression was less marked in France, though in the first half of the year production was hampered by labour troubles, high fiscal charges, and a high rate of interest. For the year, however, the index of industrial production receded only from 88 to 82. Wholesale prices in gold of 126 articles declined from an average of 71 in 1937 to 57 in 1938, and to 54 in the last quarter of the year. Exporters were thus enabled to take advantage of the situation created by the devaluation of the franc. As a result, French trade with foreign countries in 1938 showed a relative improvement over 1937, and the excess of imports over exports was reduced from 15 to 11 milliards of francs. In the first half of 1938 imports of raw materials declined, due to a temporary slackening of industrial activity, while exports remained stationary. In the second half of the year imports of raw materials increased only toward the end of the year, and imports of manufactures were reduced, while the exports, particularly of foodstuffs and manufactured articles, increased largely. Trade with the colonies increased 21.8%, as against an increase of 15.4% in the trade with foreign countries. Further progress was made in 1939 when the trade showed increases in all categories of imports and exports over 1938, and the total was larger both in francs and in gold. In the first seven months of 1939 the colonies supplied 75% of the imported foodstuffs by value and 28% of all imports, as against 73% and 26% in 1938.

Other Countries.—Italian imports and exports for the first seven months of 1939 were valued at 6,084,000,000, and 5,958,000,000 lire. Compared with the corresponding period of 1938 imports showed a decrease of 898,000,000 lire, and the exports an

increase of 63,000,000 lire. Nearly all classes of imports declined in value, the principal exceptions being cereals, copper, and hides. Exports of vehicles increased 141,000,000 lire in value, and the exports of rayon and artificial fibre products 130,000,000 lire, nearly all other classes showing lower values in 1939. Japanese trade for the first nine months of 1939 showed an increase of 170,000,000 yen in imports (chiefly in metals, fertilizers, and machinery) and an increase of 575,000,000 in exports. Exports of raw silk increased 68,000,000 yen in value, though the quantity exported went down from 44,662,000 to 36,899,000 pounds. Increases ranging from 20,000,000 to 60,000,000 yen were recorded in the exports of canned foods, chemicals, cotton yarn, metal manufactures, wood and machinery. Exports of cotton and silk piece goods declined in value, but the decline was overbalanced by the higher values of other textiles. Argentine exports for the first 11 months of 1939 totalled 11,786,292 metric tons valued at 1,418,000,000 pesos, as against 8,321,149 tons valued at 1,272,000,000 in 1938. Exports of wheat were more than doubled, rising from 1,836,032 to 4,277,384 tons, while the exports of maize increased from 2,398,623 to 3,011,149 tons. Agricultural exports in the aggregate showed an increase of 49.3% in quantity, but only 14.3% in value. Good crops had depressed agricultural prices everywhere. In the first six months of 1939 Canada exported 51,313,000 bu. of wheat, just about twice the quantity exported in 1938, but the value was nearly the same for both periods, as the price per bushel declined from \$1.18 in 1938 to 61.4 cents in 1939. Prices increased in the last quarter of 1939, however. (See also INTERNATIONAL TRADE.) (J. J. K.)

Eye, Diseases of. **Trachoma.**—Two discoveries of great significance to sufferers from trachoma, a disease of the eyes that often results in blindness, have resulted from studies carried on over a period of years among the American Indians, great numbers of whom are afflicted with the disease. That the disease is contagious and hence due to some exogenous agent has been known for many years. The causative agent, however, had not been determined until recently. It is now generally conceded that the etiologic agent belongs to the group of filterable viruses. The particle size of the virus is probably relatively large and it may be identical with the elementary body of Prowazek and Halberstaedter.

The most effective treatment known for trachoma when administered during the early stages of the disease is sulphanilamide, first used by Dr. Fred Loe, of the Indian Medical Service, in Aug. 1937. The symptoms of the disease disappear within a few days after treatment is begun, and complete cures are accomplished within a few weeks in the majority of cases treated. The prevention of blindness from trachoma in thousands of people makes this use of sulphanilamide probably the greatest benefaction of this most important drug that has yet been reported.

Optic Neuritis.—Toxic amblyopia, or blindness from the effect of exogenous poisons such as alcohol and tobacco on the optic nerve, is found to be the result of deficiencies of vitamins in the diet. The addition of stated amounts of vitamin B₁ will restore vision in cases of recent blindness, even though the use of alcohol and tobacco be continued in excessive amounts. The same vitamin is found to be effective in preventing blindness in persons who are given tryparsamide for syphilis of the central nervous system.

Vitamin Therapy.—The mechanism of vision is a complicated function of physical and chemical actions and reactions within the eye. The nervous visual elements are rod- and cone-shaped cells in the retina which contain nerve endings sensitive to change produced by light on a photosensitive substance contained in the rods and known as visual purple. This substance has been shown to be identical with vitamin A. Night blindness is an hereditary

disease of the eye in which there is a deficiency of visual purple in the visual cells. It has been assumed that persons whose diet was consistently poor in vitamin A or who assimilated less than the normal amount would exhibit impaired vision due to a raised light threshold. On basis of this assumption, great quantities of vitamin A in various marketable forms have been added to the diet of under-nourished persons. The evidence of vitamin A deficiency has rested on a test for one's light threshold. If found to be raised above that of a supposedly normal individual, it constituted *prima facie* evidence of vitamin A deficiency. Recently, carefully controlled research has shown that elimination of vitamin A from the diet of a healthy adult for nine months does not necessarily result in a raised light threshold nor in any noticeable way impair the health of the individual. Administration of vitamin A to persons who have hereditary night blindness does not materially improve the vision.

Surgery of the Cornea.—Recent improvements in the technique of operation for deeply scarred and clouded corneas have made possible the transplantation of sections of the entire thickness of the cornea from one human eye to an eye of another person.

If the eye is otherwise in good functional condition, a section of the clouded cornea may be removed and a similar section of clear cornea removed from another human eye and transplanted to the damaged eye so that useful vision may be obtained through the transplanted clear cornea. It is not necessary to take the transplant from a living eye.

Sections may be taken from the clear cornea of an eye removed because of injury or some other cause and kept at a low temperature for several weeks. Eyes of infants or adolescents are more likely to have clear, healthy corneas than those of elderly persons and are preferred as sources of corneal transplants.

Cancer Prognosis.—Recently evolved methods of preparation for pathological study of malignant melanomas of the eye have formed the basis for classification that has prognostic value. The tumours are classified according to their cell type and fibre content. Five cell-types are recognized; *viz.*, spindle A, spindle B, fascicular, epithelioid and mixed. The fibre classification is based on the relative content of argyrophil fibres, as demonstrated by the Wilder reticulum stain, into three groups with sub-groups. In the classification by fibre content, malignancy of the tumour appears to be inversely proportional to the degree of intercellular invasion by argyrophil fibres. To present an example of the importance and practical application of utilizing both methods of classification: A mixed-cell tumour does not often metastasize if it is heavily fibred, but a moderately fibred, mixed-cell tumour is far more apt to metastasize than is a spindle B having approximately the same fibre content. The two classifications, used in conjunction with each other, definitely narrow the field of error in the prognosis of uveal melanoma. (See also VITAMINS.)

Centre: APPROXIMATELY 100,000 JEWS witnessed the dedication of the Jewish Palestine pavilion at the New York World's Fair May 28, 1939

Below, left: THE SOVIET PAVILION was a visitor's favourite among foreign buildings at the New York World's Fair in 1939

Below, right: CROWDS IN FRONT OF THE FEDERAL BUILDING watched the formal opening ceremonies of the Golden Gate International Exposition Feb. 18, 1939, at San Francisco

and *The Private Life of Don Juan* (1934), the latter produced in England. Though Fairbanks's career virtually ended with the passing of silent motion pictures, he continued active association with the industry and was organizing a new producing company, Fairbanks International, at the time of his death. He died December 12 at Santa Monica.

Fairs and Exhibitions, or Expositions, these words are used interchangeably, especially fairs and expositions. Today fairs and expositions may be grouped in two main classifications. The first is where the participation of exhibitors and Government agencies is practically restricted to the country or section of the country in which it is held, for example the Texas Centennial Exposition, Dallas, 1936; or San Diego, California, 1936; and Glasgow, Scotland, 1938. Secondly, those that are international in scope presenting not only industry, art, government and science of the nation in which the exposition is held, but including major participation by foreign nations, as the Exposition Internationale, Paris, 1937, at which a large number of the nations of the world distinguished themselves with exhibits.

In 1939, two major expositions were held in the United States of America, the Golden Gate Exposition, at San Francisco, Calif. and the New York World's Fair, in New York city. These two great expositions will again open in the spring of 1940. The exposition in San Francisco was held on a man-made island of 400ac. in the centre of San Francisco bay.

The theme, "Recreation—Man's Gift from a Machine Age" shares in the dedication to Western Pacific achievements, and to transportation and communications as symbolized by: "The world's two largest bridges spanning San Francisco bay, the trans-Pacific air routes, the giant water and power projects of the west; also radio, cinema, and television." After the close of the exposition, the island will become the Metropolitan Airport. Architecturally, this exposition's palaces combine the beauty and dramatic phases of oriental and occidental architecture. Internally, these palaces more nearly follow the older type plan of large halls with great roof spans, externally presenting architectural units and harmony. The main backbone of the plan is L-shaped, made up of two avenues at right angle to each other. At this main intersection is a great circular court in which the dominating feature is the exposition tower 400ft. high. This exposition closed its gates with an attendance of 10,496,203 paid admissions.

The New York World's Fair opened in May 1939, presenting an entirely different picture from the exposition in San Francisco, being much larger, covering 1,216ac., including parking areas and transportation facilities. The site is at Flushing Meadow Park, in the borough of Queens, Long Island. Here the exposition reclaimed a swamp which, at its close, will be a public park.

The exposition's theme is "The World of Tomorrow." The exhibits of industry, science, art, education and government portray a vast panorama, showing that what man is building today will be the world of tomorrow; with emphasis on the vital necessity of rational co-operation among nations, classes and people. The plan of the exposition is functional in that the designers placed an important plaza at each entrance, from which radiate broad avenues to the focal theme building, called the "Trylon and the Perisphere," the Perisphere being a true sphere, 180ft. in diameter, alongside which stands the Trylon, triangular in plan and tapering to a point some 720ft. in height. Inside this Perisphere, reached by 80-ft. escalators, is a dramatic presentation of the exposition's theme, emphasizing the interdependence of man.

All phases of American industry, commerce, and transportation

are shown, many in their own distinctive and individual buildings; thus it may be said that the architecture reflected the individual freedom of thoughts of those creating it. Similarly this repeats itself in the most impressive foreign participation that any American exposition has ever had, some 62 foreign nations with buildings and exhibits adjacent to the dignified United States Federal group. Architecturally, and from the point of view of exhibit design, many of the foreign nations presented new and stimulating forms and ideas. The New York World's Fair closed its gates with a total of 25,817,265 paid admissions.

Both expositions had on view significant exhibits of art, San Francisco with its outstanding collection of Italian Masters, shown in the United States of America for the first time. After the exposition closed they were on view in Chicago and New York. In the New York World's Fair, a special building housed a collection of paintings called "Masterpieces of Art," portraying the great epochs of European Art from the Middle Ages to 1800; valued at \$30,000,000. (L. Sk.)

Fair Trade Laws: *see* LAW (CASE): *Trade Regulations*.

Falk Foundation, The Maurice and Laura,

Pittsburgh, under its policy of attempting to promote the general economic welfare of the United States through the research study of problems affecting American trade, industry, and finance, added four new investigations to its program in 1939: a study of war-time price, wage, and fiscal policy was begun at the Brookings Institution, Washington, D.C., under a grant of \$13,000 at the joint request of the Brookings Institution and the United States War Department; a study of the trends of production and productivity in nonmanufacturing industries, 1899-1937, was inaugurated at the National Bureau of Economic Research, New York, under a \$60,000 appropriation as a sequel to a study of the trends of production and productivity in manufacturing industries, 1899-1937, initiated at the National Bureau under the Foundation's grant of \$30,000 in 1938; a study of ways and means of reducing industrial prices in the interest of expanding production, under a grant of \$21,000 to the Brookings Institution; and a study to integrate the findings of the Brookings Institution's entire program of research investigations into a single, comprehensive platform for the promotion of national prosperity, under a \$35,000 appropriation from the Foundation. The Foundation also continued through 1939 its grants to the Brookings Institution for two studies begun prior to 1939: the study of wages in relation to the distribution of the national income (\$65,000 total appropriation) and the study of the relationship of government to economic life (\$100,000 total appropriation). During 1939 the Foundation contributed \$50,000 to the general support of the Brookings Institution's research activities and appropriated \$10,000 to the Carnegie Institute of Technology, Pittsburgh, for the annual support of the Maurice Falk Professorship of Social Relations, pending payment of the Foundation's \$300,000 endowment-grant for the Professorship. Farmers' Co-operatives. The Federal Farm Credit Administration, which supervises farm loan agencies of the United States and operates to extend and improve farmers' co-operative enterprises, is publishing a series of booklets, one for each State, describing farm co-operatives in each State. The purpose is educational, toward demonstrating more efficient methods, since co-operatives vary widely among the different States, both in structure and in business op-

erations. Among the booklets already issued are those on Virginia, Ohio, Kentucky, Michigan, Nebraska and Kansas. The Administration's Co-operative Research and Service division issued in 1939 Circular C-113 on farm co-operatives that handle petroleum products. Owing to the widespread use of power machinery on farms 1,035 farm co-operatives in 1939 specialized in handling petroleum products. The Administration also announced that the first co-operative oil refinery, that of the Consumers' Co-operative association of North Kansas City, Mo., would be built at Phillipsburg, Kan., at a cost of \$700,000, including pipe lines. Of the 15,573 farmers' co-operative associations and mutual companies about one-half are borrowers of working or fixed capital. The peak of such borrowing in 1939, the Administration reported, was \$314,553,000, of which 39% was borrowed from commercial banks, 26% from the Federal banks for co-operatives and the remainder from individuals and other sources. The 15,573 farm co-operative enterprises include approximately 5,000 mutual telephone companies that have 669,000 subscribers (approximately one subscriber to every mile of wire) and an investment of \$27,000,000. Farmers' mutual fire insurance companies to the number of 1,950 have more than \$11,000,000,000 of insurance in force. The rapid growth of livestock auctions has provided sharp competition for farmers' livestock co-operatives and is the subject of a special study by the Administration's Research and Service division in the Aug. 1939 number of the Administration's monthly magazine, *News for Farmer Co-operatives*. (S. O. R.)

Farm Income. War's impact on prices was illustrated with unusual sharpness by the United States farm income, which in August was estimated at \$7,900,000,000 for 1939, by the Bureau of Agricultural Economics of the Dept. of Agriculture, and in October at \$8,300,000,000. In the first two weeks of the war the general index of prices received by farmers rose 10 points, the largest monthly change since the devaluation of the dollar in 1933. The annual August estimate by the Bureau of Agricultural Economics, while, of course, entirely preliminary, is usually remarkably accurate and close to the final estimate. The outbreak of war in September, however, caused the Bureau to raise its estimate from a figure lower than the income of 1938 to more than \$250,000,000 higher than that of 1938. The advance was caused chiefly by rises in the prices of grain, sugar, lard, fresh pork, beans and to a lesser extent by beef, lamb, cured meats, butter, vegetables and fruit. There were recessions from most of these advances after the first weeks of the war. The foregoing estimates include cash income for products marketed, commodities under Government loan in 1939 and Government conservation and parity payments to farmers. The comparable estimate in 1938 was \$8,020,000,000. In 1937 it was \$8,988,000,000, the highest in 10 years. Added to this, to round out the gross farm income, is the value of farm products retained on the farm for home consumption. This was estimated at \$1,200,000,000 in 1939, at \$1,279,000,000 in 1938, and at \$1,437,000,000 in 1937. Government payments were estimated as at least one-third larger in 1939 than in 1938. These payments approximated \$675,000,000 in 1939. In 1938 they were \$482,000,000, and \$367,000,000 in 1937. The farm-to-retail price spread has remained remarkably steady from 1936 to 1939 in the comparisons of 58 foods by the Bureau of Agricultural Economics. The farmer's share rose from 35 cents in 1932 to 45 cents in 1937, and remained at 40 cents in 1938 and the first seven months of 1939. War prices in September sharply reversed the downward tendency that had persisted for 2½ years. The total cash farm income has increased from the low of 1932 each year to 1938.

In 1932 it was \$4,328,000,000. But for the war-time advance the total receipts from crops in 1939 would have been about 7%

less than in 1938, or approximately \$2,925,000,000, according to the August estimate, against \$3,153,000,000 in 1938 and \$3,845,000,000 in 1937. (S. O. R.)

Farm Machinery. Experimental machines, corn combines, to pick, husk and shell corn, all in one operation, were put in the field in 1939 by several farm implement manufacturers in the United States. Results were announced as satisfactory, except engineers do not consider the experience conclusive as to the shelling operation. The 1939 harvest season was unusually dry and the hard, dry corn shelled with exceptional facility. Engineers indicate a need for experience in wet seasons when corn is soft. The value of farm machinery production in 1939 in the United States was announced as substantially over that of 1938, which was \$490,013,369. In 1937 it was \$580,945,914, and \$487,273,428 in 1936. Tractors on U.S. farms April 1, 1939, numbered 1,625,820, as compared to 1,527,989 on the same date in 1938 and 1,382,872 in 1937. These figures on tractors are from the *Farm Implement News* (Chicago), which makes a careful annual compilation that allows for obsolescence. Increased production of tractors in 1939 included a number of new small models. Production and sales of corn handling machinery were also heavy and there was a general increase in farm machinery excepting wheat combines which declined. A most unusual development in farm machinery is one which is transforming farming operations from the age-old straight lines to curves, for no longer must a farmer "plough a straight furrow." Instead he ploughs in curves

THE FARMALL-A TRACTOR, introduced in 1939, is an all-purpose machine that permits direct vision ahead

to conform to the contour of sloping fields and thus prevent erosion by washing.

(S.O.R.)

Farm Mortgages. The total farm mortgage debt in the United States declined to \$7,071,000,000 in 1939, the smallest amount in twenty years. Not since 1918 has the total been smaller. It was \$6,541,000,000 in that year. The year 1923 had the largest total of farm mortgages, \$10,751,000,000, the peak of a steady advance year by year since 1910. Since 1923 the volume of farm mortgage debt has decreased every year, excepting in 1928 and 1929 over 1926 and 1927. The total of farm mortgages in the United States in 1938 was \$7,214,000,000. It was \$9,631,000,000 in 1930. In 1920 it was \$8,449,000,000. In 1910 it was \$3,208,000,000.

The volume of farm mortgages had its sharpest advance following the break in agricultural and land prices in 1920. Many farmers mortgaged their farms to pay for operating losses or to secure unpaid debts. Farm land had been at high war-time values and many sales made before the collapse involved mortgage payments after the break. Life insurance companies, Federal land banks and the then active joint stock land banks provided funds for the expanding loans. Foreclosures increased rapidly from 1923 to 1926 and in 1932 and in 1933, in which latter year Congress adopted the Emergency Farm Mortgage Act and various States passed measures to relieve debt-burdened farmers. Since then, foreclosures have declined. The decline although general, has not been uniform in all major areas, being steadiest in the west north central States, while mortgage debt increased in New England in 1936, 1937 and 1938. A comprehensive survey, "Thirty Years of Mortgage Debt," by Donald C. Horton, appears in the Oct. 1939 issue of *The Agricultural Situation*, U.S. Department of Agriculture, from which the following table of U.S. farm mortgage debt is taken:

1910	\$3,208,000,000	1925	\$9,913,000,000
1911	3,522,000,000	1926	9,726,000,000
1912	3,929,000,000	1927	9,671,000,000
1913	4,352,000,000	1928	9,765,000,000
1914	4,712,000,000	1929	9,761,000,000
1915	4,994,000,000	1930	9,631,000,000
1916	5,259,000,000	1931	9,462,000,000
1917	5,828,000,000	1932	9,213,000,000
1918	6,541,000,000	1933	8,638,000,000
1919	7,142,000,000	1934	7,887,000,000
1920	8,449,000,000	1935	7,786,000,000
1921	10,198,000,000	1936	7,639,000,000
1922	10,660,000,000	1937	7,390,000,000
1923	10,751,000,000	1938	7,214,000,000
1924	10,647,000,000	1939	7,071,000,000

(S.O.R.)

Farm Tenancy. For the year ending June 30, 1940, the U.S. will have lent \$38,000,000 to approximately 7,068 landless farmers in 1,300 counties to enable them to buy farms and thus help check the growing farm tenancy. This is the

third year of a three-year movement instituted in 1937 by Congress under the Bankhead-Jones Act. At that time two of every five farmers were tenants and tenancy was increasing at the rate of 40,000 a year.

In 1937-38, \$10,000,000 was lent to 1,840 farmers in 332 counties to buy farms at an average cost of \$4,999 and an average size of 130 acres. In the second year, 1938-39, loans of \$25,000,000 were made in 732 counties, the average loan being \$5,562. For the third year, 1939-40, the sum of \$40,000,000 was appropriated, but loans totalled \$38,000,000, since 5%, or \$2,000,000, was allowed for administration. By the end of 1939-40 it is expected that 13,250 landless farmers will own farms, subject to a first mortgage held by the United States. Eligible borrowers must be tenant farmers, sharecroppers or farm labourers, and citizens of the United States. Preference is given to married men or those with dependents, to those who own livestock and tools and to those able to make a down payment. Farms on which loans are made must meet certain specifications. If necessary a loan contains provision for constructing farm buildings, and 1,600 new farm-houses have been built thereunder at an average cost of \$1,300 and according to specifications by Agricultural Department engineers. The secretary of Agriculture selects the counties in which loans are to be made, on recommendation of State Farm Security Advisory Commissions.

County committees of three farmers certify which applicants should receive loans. (S. O. R.)

Farrand, Livingston (1867-1939), U.S. educator and leader in public health movements, was born at Newark, N.J., on June 14; after graduating from Princeton he took his medical degree at Columbia, then studied for two years at Cambridge and in Berlin. From 1893 to 1914 he taught psychology and anthropology at Columbia, and from 1905 to 1914 he was also executive secretary of the National Association for the Study and Prevention of Tuberculosis. He was president of the University of Colorado from 1914 to 1919, and took a leave of absence in 1917-18 to direct the tuberculosis work of the International Health Board in France. In 1921, after serving for two years as chairman of the central committee of the American Red Cross, he was appointed president of Cornell university and held this position until his retirement as president emeritus in 1937. He died November 8 at New York city. Dr. Farrand was editor of *The American Journal of Public Health* (1912-14) and author of *Basis of American History* (1904).

Fascism is the name for a political philosophy which puts the nation-state or the race, its power and growth, into the centre of life and history. It disregards the individual and his rights, as well as humanity, in the exclusive interest of the national collectivity. As a political technique it aims at the maintenance and power of a single party which identifies itself with the state and makes it subservient to its aims. Under its guidance the whole nation is strictly regimented politically, economically and culturally; its organization is modelled after the army with its stern insistence upon authority and discipline. All individual rights and civil liberties are abolished. Fascism does not believe in the equality of individuals or races. It extols the sacred egoism of the nation, disbelieves in international co-operation, stresses military virtues and scorns humanitarian sentiments, conciliation and compromise. Fascist insistence upon the right of the stronger, its disregard for universally binding international law and for reciprocity and equal rights of peoples, were responsible for the international anarchy characteristic of the '30s in the 20th century.

During the year 1939 the fascist powers, Germany, Italy and

Japan, supported by a number of smaller states like Spain, Hungary and Manchoukuo, had reached a very high degree of collaboration. Their diplomatic interplay and mutual support found an expression in the Anti-Comintern pact which had been concluded in 1937 and whose importance seemed to grow at the beginning of 1939 when it was joined by Hungary and Spain. It formed a kind of fascist anti-League, opposed to the democratic League of Nations, infinitely more active and showing much greater cohesion than the latter. In May 1939 the Anti-Comintern pact was strengthened by the conclusion of an outright defensive and offensive military alliance between Germany and Italy. Influential Japanese circles aimed in the middle of 1939 at the extension of the military alliance to Japan. The sudden and unexpected conclusion of the pact between the Soviet Union and National Socialist Germany in Aug. 1939 changed the whole situation. It deprived the Anti-Comintern pact of its leading member and it left Italy, Japan and the lesser members of the Anti-Comintern pact in a state of confusion. Fascism, and especially National Socialism, had proclaimed itself the bulwark against communism. Even in the democratic countries many conservatives had viewed with great favour the rise to power of fascism and national socialism and had supported them as fighters against communism and against the Soviet Union. Now all pretence of fighting communism or the Soviet Union was dropped by national socialism. The element of nationalistic collectivism or communism, always contained in national socialism, was now stressed more than before. A common front was established against the democracies which were called, by the fascists as well as by the communists, plutocratic and imperialist. In his New Year's proclamation Chancellor Hitler and the editorials in the National Socialist press proclaimed the war as an "international revolution" destined to put an end to capitalistic society. The former violent attacks against "Jewish communism" and against the "international Jewish Marxist conspiracy" were now replaced by diatribes against "Jewish capitalism," "democratic war mongers" and plots by "international bankers." The Russians were admitted with the Germans to the honour of "young and productive nations to whom belongs the future."

National Socialism remained, however, distinct from communism by its insistence upon the inequality of races. Accordingly the Czechs and Poles in the annexed territories were regarded as helot peoples and were accorded a treatment resembling that of the Jews. In view of this turn-face of National Socialism in its attitude towards communism and the Soviet Union, the other members of the Anti-Comintern pact had great difficulty in adapting themselves to the new situation. Fascist Italy remained faithful to her alliance with Germany and stressed her defiant contempt for democracy. On the other hand it tried to strengthen its position as against Germany and the Soviet Union by closer collaboration with the Vatican. As the result the Vatican condemned strongly the totalitarian state in Germany and in Russia, but praised fascism in Italy.

Outside the fascist countries fascism made hardly any progress during 1939. The new determined attitude of Great Britain and France against fascist aggression acted as a check upon fascism in all European democracies. For the first time in seven years fascism found itself internationally put on the defensive. Only in the United States fascism seems to have made some progress. The various fascist groups were united by anti-Semitism and by a strictly isolationist attitude in foreign policy. The lack of suitable leadership and of cohesion between the many small fascist and semi-fascist organizations prevented, however, fascism in the United States from reaching any real importance. The future of fascism in the United States as in Europe and the Far East, depends upon the outcome of the war, which, at the beginning of

1940, was being fought on three different, but closely connected, theatres of war. (See also ANTI-SEMITISM; COMMUNISM; DEMOCRACY; GERMANY; ITALY; JAPAN; MINORITIES; PACIFISM; SPAIN.)

Fashion and Dress. At the outset of 1939, women were wearing trim, youthful suits and dresses in the daytime and at night, romantic, full-skirted evening dresses. The skiers were skiing in long tapered, ski-instructor's pants, shirts, and windbreakers, and the ski skirt was just beginning to be worn by the young and expert. Fancy skating gained many new devotees, and on the rinks, full, short, velveteen or woollen skirts with bright tops and light skating boots, instead of dark ones, began to appear. Winter sports left their mark on fashion. The hooded windbreakers of the ski resorts gave us hoods—hooded fur coats, hooded capes for evening, separate hoods, woollen hoods, chiffon hoods, hoods attached to evening dresses. The skaters set the fashion for very short, flared or pleated skirts. By August, college girls were wearing them, with bare knees and long, cablestitch knitted socks.

The spring of 1939 brought in more youthful, feminine suits, with pleated, flared, or straight skirts, tightly fitted jackets and gay blouses. Prime Minister Chamberlain's famous umbrella and the Chamberlain hat appeared as a motif in prints and accessories. Hats were little, coquettish and extremely feminine, sometimes no more than a mere fold of ribbon on the head. Hair stayed up in front, but went down again in back—curls or a roll on top, a long mane behind. The snood, in chenille or in fish net, was tremendously worn.

The summer brought out the bare-midriff dress, based on the already successful two-piece bathing suit. Play dresses and evening dresses were made with bare skin showing between the top and the skirt. Considered daring, at first, they caught on at the summer resorts, swept Hollywood, and became an important new trend.

In summer too, the flat sports sandal came in for a wave of popularity. Instead of the high-heeled sandal that women had worn with their summer dresses, flat peasant sandals appeared. Some were sandals copied from those of Greece, Italy, Syria or Mexico. Others were moccasins, inspired by the North American Indian.

Increased travel to South America had no repercussion on fashion, but a Brazilian singer, Carmen Miranda, appeared in a New York revue with her head done up in a fantastic turban, and towards the end of the summer, turbans came in. A draped turban in velvet or wool jersey with a big double twist of the material over the forehead was reproduced ad infinitum.

The autumn fashions were dramatic and opulent, despite the approaching war in Europe. The exhibition of the Prado paintings in Geneva, Switzerland, fired the designers with Spanish colours. Flashes of vermilion red appeared on black dresses—red hats and red accessories were seen everywhere. From the paintings of the Spanish bullfighters, came hats with long snoods of net or velvet or silk jersey falling down in back. Balenciaga, the Spanish designer, produced full-skirted Infanta dresses and Infanta head-dresses made of curling feathers. In direct contrast to the full skirted line, some evening dresses were straight, and covered the wearer from neck to wrist. One heard talk of the "cigarette silhouette" and "that covered-up look." Long sleeved, high-necked dresses were made in sumptuous materials. Pockets became important. The full skirts of dinner dresses had pockets. The pockets

Lower right: TYPICAL BLACK-OUT FASHIONS of London and Paris, with white hats and accessories

of winter suits were enlarged to form a sort of muff of fur, or material. Many of the winter dresses had fitted bodices, requiring a very slender waist. Beauty salons advertised wasp waist treatments. Mainbocher's sensational new corset, laced up the back, made front page headlines.

Parisian designers had just completed their winter collections, when war burst out in Europe. Under the patronage of the French Government, the fashion industry continued to operate. In London and Paris, blacked out at night against air raids, new fashions began to appear.

White hats and accessories shone out instead of headlights. Dressy town clothes were replaced by suits, tailored almost like uniforms. Versions of military epaulettes appeared on shoulders. The flashlight became a smart accessory. Containers were designed to cover the inevitable gas mask. The ankle-length dinner dress came in, because of its practicality on emergency nights. And lastly, hats quieted down, were no longer silly, but sensible little toques, serious felts, or wool helmets with scarfs wound under the chin. (See also FURS.) (C. SN.)

Fawcett, George D. (1860-1939), American actor, was born near Fairfax, Va., on August 25 and was educated at the University of Virginia. He made his theatrical debut in *The Maid and the Moonshiner* at New York city in 1886. For many years he appeared in a succession of non-starring roles with Maude Adams, Alexander Salvini, and others. He founded his own stock company at Baltimore in 1900, where he directed and produced a long series of successful plays. In 1909 he appeared as the title character in *The Great John Ganton*. Six years later he had his first role in motion pictures, in *The Majesty of the Law*. During his long and notable film career he was cast with Greta Garbo, John Barrymore, John Gilbert, Joan Crawford, and many other stars. His stage career stood him in good stead after the advent of the "talkies" and he continued playing in such pictures as *The Great Divide*, *Hot for Paris*, and *Ladies of Leisure*. He died at Nantucket, Mass., on June 6.

Fearn, Anne Walter (1867?-1939), American woman physician, was born in Holly Springs, Miss., and graduated in 1893 from the Women's Medical college of Philadelphia. Immediately after receiving her degree she went to China, where she spent the greater part of her life. Her first position was as chief physician in the Women's hospital at Soochow. In 1895 she established a Chinese co-educational medical school, and later she built her own hospital, the Fearn Sanatorium, in Shanghai. She married Dr. John Burrus Fearn, a medical missionary, in 1896. Her autobiography, *My Days of Strength*, was published in the spring of 1939—shortly before her death at Berkeley, Calif., on April 28.

Fechner, Robert (1876-1939), U.S. Gov't official, was born March 22 at Chattanooga, Tenn. After working as a machinist and master mechanic he became identified with labour movements and in 1913 was elected executive officer of the International Association of Machinists. During the World War he was a labour arbiter. President Roosevelt appointed him director of the Civilian Conservation Corps when this agency was established in 1933. During his six years as head of the CCC he directed the activities of approximately 2,000,000 young men. Fechner died December 31 at Washington, D.C.

Federal Bureau of Investigation of the United States Department of Justice is charged with the duty of investigating violations of the laws of the United States, collecting evidence in cases in which

AGENTS of the Federal Bureau of Investigation firing tracer bullets from sub-machine guns on a practice range in Washington, D.C., during the G-men's annual retraining session in July 1939

the United States is or may be a party in interest, and performing other duties imposed upon it by law.

Special agents of the FBI, prior to appointment, must be between the ages of 23 and 35, graduates of recognized law schools, who have been admitted to the bar and had at least two years of legal or business experience, or graduates of recognized accounting schools who have had at least three years of practical commercial accounting or auditing experience. Following appointment, they attend the FBI's training school for 16 weeks before actually being assigned to investigative work. Since the FBI National Police Academy was organized in 1935, it has graduated nearly 400 police instructors, most of whom have inaugurated police training schools upon their return to their local communities.

In the fiscal year of 1939, over 5,100 convictions were secured in cases investigated by special agents of the FBI. During the year 3,982 stolen cars were recovered which were transported in interstate commerce. Since the passage of the Federal Kidnaping Act in 1932, 156 cases of kidnapping and plots to kidnap were reported to the FBI and on July 1, 1939, 154 of the cases had been completely solved. Bank robbery reached its peak in 1932 and following the passage of the Federal Bank Robbery Act in 1934, bank

robberies have declined nearly 80%. In the year 1939 convictions were secured in 96% of the cases brought to trial.

In 1924, the Identification Division of the FBI was founded with a nucleus of 810,000 fingerprint records, and on July 1, 1939, nearly 11,000,000 fingerprint records were on file. Despite this growth it is possible to identify an incoming set of impressions in three minutes. A total of 1,960,299 fingerprint records was received in 1939 as against 1,692,890 in 1938. Nearly 60% of all criminal prints received in 1939 were identified after search through the files. The Civil Identification Section, maintained for the insurance of personal identity of citizens, now numbers nearly 1,500,000 fingerprint records. Of the 5,559 scientific examinations, involving over 39,000 different specimens, made by the Technical Laboratory in 1939, 1,394 were for local authorities. The cost of operating the FBI during the past 15 years was \$52,370,222.08 while savings to the Government, property recoveries, and fines imposed in cases investigated by Bureau Agents totalled almost \$252,000,000. Federal Council of the Churches of

Christ in America. In 1939 the constituency of the Council comprised 22,188,422 communicant church members, 13 years of age or over, in 22 national denominations. These included most of the major Protestant bodies and one church (the Syrian Antiochian Orthodox) of the Eastern Catholic group. Three of the churches included in the council—the Methodist Episcopal, the Methodist Episcopal South, and the Methodist Protestant—merged into a single body.

A "University Christian Mission" was conducted in 20 educational institutions as a united effort of the churches to bring about a revival of spiritual life. A "Fellowship of Prayer" was promoted throughout the Lenten season. Religious programs were presented over a national radio network at least once every day in the year.

Interdenominational conferences on preparation for marriage and home-making, on the relation of mental hygiene and religious work, on public worship, and on Christian social responsibility were held in local communities throughout the United States.

An international conference was organized at Geneva, Switzerland, on the relation of the churches to the war crisis and on the contribution of the churches to a lasting peace. Programs of assistance for civilian sufferers in China and for Christian refugees from Europe were carried on. An educational effort for interracial co-operation through the churches culminated in the observance of a Race Relations Sunday. *Information Service* was published weekly, presenting analyses of and reports on contemporary social, industrial, educational, and international problems of special interest to the churches. A plan for the unification of all American interdenominational agencies was presented to the churches and a study of greater unity in foreign missions was begun. The officers of the Council were: Rev. George A. Buttrick, president; Dr. John R. Mott, vice-president; Rev. Samuel McCrea Cavert, general secretary. (S. McC. C.)

Federal Home Loan Bank System was created by Act of U.S. Congress on July 22, 1932, to provide reserve credit facilities for the principal thrift and home financing institutions of the United States. It is supervised by the Federal Home Loan Bank Board composed of five members appointed by the President. The struc-

ture consists of 12 regional banks and their member institutions. The regional banks are located in Boston, New York, Pittsburgh, Winston-Salem, Cincinnati, Indianapolis, Chicago, Des Moines, Little Rock, Topeka, Portland and Los Angeles.

Membership is open to lending institutions making long-term loans on homes. The present membership consists of building and loan associations, homestead associations, co-operative banks, savings institutions, and insurance companies. Institutions approved for membership must invest in the capital stock of their respective regional banks. The secretary of the Treasury was also authorized to buy stock, and at present the Government owns approximately 75-3% of the aggregate stock of the regional banks. It is contemplated that eventually all of the stock will be owned by the member institutions. The banks obtain their funds, beyond their capital stock, through the sale of debentures and by accepting deposits from members.

The resources of each bank are used mainly to make advances to members for the purpose of providing additional accommodations to local home owners and investors. Under certain conditions, advances for a short term may be obtained without the deposit of collateral. Long-term advances, which may run up to periods of 10 years, must be secured by approved home mortgages or other acceptable collateral. The Bank System has experienced steady and rapid growth. On Jan. 1, 1933, it had but 101 members with estimated assets of \$217,000,000. By Dec. 31, 1939, membership had increased to 3,920 of which 2,472 were State-chartered home-financing institutions, 1,398 Federal savings and loan associations, 40 insurance companies, and ten savings banks; their estimated assets were \$4,700,000,000. On the same date the paid-in stock of the Bank System amounted to \$165,718,950 and the consolidated assets of the banks came to \$254,680,416. During 1939, institutions which were members of the Bank System made, according to careful estimates, about 38% of the new mortgage loans on urban residential property (houses for from one to four families) made by all private institutional lenders throughout the United States. In addition to their duties arising from the administration of the Bank System and the supervision of Federal savings and loan associations, the Federal Home Loan Bank Board serves as the board of directors of the Home Owners' Loan Corporation and also constitutes the board of trustees of the Federal Savings and Loan Insurance Corporation.

Federal Land Banks. The 12 Federal land banks operating in the United States since 1917, under the Federal Farm Loan Act of 1916 and subsequent legislation, make long-term first-mortgage loans on farms through 3,700 local co-operative lending institutions known as national farm loan associations. Since 1933 the land banks and the local associations have operated under the supervision of the Farm Credit Administration which also supervises other Federally sponsored co-operative institutions providing short-term production credit and loans to farmers' co-operative business organizations.

Federal land bank loans outstanding on Sept. 30, 1939, aggregating \$1,922,600,000, plus \$703,800,000 of Land Bank Commissioner loans made by the land banks as agents, represented 37% of the total farm mortgage debt of the country. Land Bank Commissioner loans, made on second as well as first mortgage security, were first authorized in 1933 for emergency financing, and can not exceed \$7,500 to any one farmer.

The total capital of the 12 Federal land banks was \$236,521,270 on Sept. 30, 1939, of which slightly less than one-half was owned

by national farm loan associations and individual farmers borrowing directly from the banks. The remaining amount was provided, and is owned by, the United States Government. Funds for making loans are obtained primarily from the sale of farm loan bonds to the investing public. Farm loan bonds aggregating \$1,776,696,-040 were outstanding on Sept. 30, 1939.

On Jan. 1, 1940, Federal land bank loans were being made to farmers through national farm loan associations at an interest rate of 4%, which is 1% above the rate at which the last preceding bond issue was sold. The rate of interest is temporarily reduced to all borrowers by Act of Congress.

Federal Reserve System. During 1939, commercial bank reserves in excess of legal requirements rose to unprecedented levels and institutional and other investors also continued to hold a large volume of idle funds. Consequently, money and credit conditions generally remained easy. Prices of Government securities and high-grade corporate bonds, which rose in the first half of the year, declined sharply with the outbreak of war in Europe. Following substantial purchases of United States Government securities in the open market by the Federal Reserve System for the purpose of maintaining orderly conditions in the bond market, bond prices recovered most of their losses. Short-term open-market rates in New York city remained close to the all-time lows.

At the end of November excess reserves of member banks of the Federal Reserve System amounted to nearly \$5,200,000,000. The increase of \$1,700,000,000 during the preceding twelve months was primarily the result of a growth of about \$3,000,000,000 in the country's monetary gold stock, reflecting mostly imports from western Europe. Reserves were also augmented by a decrease of \$400,000,000 in the Treasury cash balances and deposits with the Federal Reserve banks, and by about \$200,000,000 of Treasury silver purchases. The increase in reserves from these sources was offset in part by (a) an increase of \$700,000,000 in the volume of currency in circulation; (b) an increase of \$200,000,000 in foreign bank deposits at Federal Reserve banks; and (c) an increase of nearly \$1,000,000,000 in required reserves in consequence of increased member bank deposit liabilities.

Bank deposits and reserves have been increasing and money rates declining in the United States since the middle of 1933. The Federal Reserve authorities generally followed an active policy of monetary ease from the time of the stock market crash in 1929 to the end of 1933, with interruptions following the departure of England from the gold standard in the autumn of 1931 and at the time of the bank holiday in March 1933.

The System's holdings of Government securities were increased from \$800,000,000 at the beginning of 1932 to \$2,400,000,000 at the end of 1933. As a result, member banks were able to retire practically all of their indebtedness at the Federal Reserve banks, and in addition to accumulate by the end of 1933 about \$800,000,000 in excess reserves. Following the reduction of the gold content of the dollar in Jan. 1934, bank reserves were steadily increased as a result of a heavy flow of gold to the United States. Excess reserves rose by the end of 1935 to over \$3,000,000,000 and continued at close to this level during the first half of 1936.

During 1935, the stock market became increasingly active at advancing prices and customers' borrowings from securities brokers and dealers expanded. In Jan. 1936, the board of governors, acting under the powers granted it by the Securities Exchange Act

of 1934, reduced the amount of credit that brokers and dealers were permitted to extend on securities registered on exchanges. At that time, the loan value for initial extensions of credit was determined by a statutory formula which automatically reduced the loan value as prices increased. The board's action changed the formula so that the loan value of securities that had advanced most in price became 45% of the current market value instead of 55%. In March, again acting under powers contained in the Securities Exchange Act, the board of governors adopted a regulation relating to loans by banks for the purpose of purchasing or carrying registered stocks. This regulation fixed the maximum amount that banks could lend initially on stocks at 45% of the current market value. At the same time, the statutory formula applicable to brokers and dealers was abandoned and the loan value of all registered securities set at 45% of the current market value, thus placing speculators who borrowed from brokers and dealers and those who borrowed from banks on very nearly the same basis. These restrictions had the advantage of providing for control of the use of credit for speculation in securities without limiting the supply or raising the cost of credit for other purposes.

In July 1936, the board of governors of the Federal Reserve System acted to increase reserve requirements of its member banks by 50%, to take effect August 15, and in this way absorbed about \$1,500,000,000 of excess reserves. Again at the end of Jan. 1937 the board announced a second and final action to absorb excess reserves by increasing reserve requirements to the full extent authorized by law. One-half of this increase became effective on March 1 and the remainder on May 1, 1937, still leaving member banks with reserve balances approximately \$900,000,000 in excess of legal requirements.

The board's action on reserve requirements was not for the purpose of restricting the use of credit but rather in the nature of a precautionary measure to prevent an injurious credit expansion in the future. The board emphasized at the time that the easy money policy pursued by the Reserve System since the beginning of the depression would continue in effect, and that the increases in reserve requirements were intended only to bring the country's credit machinery within the Reserve System's control.

In Dec. 1936, the United States Treasury, after consultation with the board of governors, adopted a policy of placing additions to the gold stock in an inactive account so that member bank reserves were no longer subject to expansion from this source.

Subsequent actions by the Reserve System and the Treasury in 1937 and 1938 as well as in 1939 implemented the policy of monetary ease. The first of these actions by the Reserve System was in connection with unsettlement of the bond market in the spring of 1937. At the turn of the year 1936-37 the previous prolonged advance in high-grade bond prices ceased, and early in 1937 there was a decline. Banks and other investors with substantial paper profits on their bond holdings began to sell in order to realize these gains. Disorderly conditions in the long-term bond market led the System to purchase Government securities of longer maturities and to dispose of securities of shorter maturities, without changing the total holdings in the System's open-market account. This was followed in early spring by the outright purchase of approximately \$95,000,000 of Government securities in the open market, which were added to the account. Conditions in the bond market became steady in April and the decline in Government security prices ceased.

By the late summer of 1937, prices of stocks and of basic commodities declined sharply and evidences of weaknesses in the business situation were becoming increasingly apparent. Therefore, during August and the early days of September, the Federal Reserve banks reduced their discount rates, bringing the rate at the Federal Reserve Bank of New York to 1%, the lowest central bank

rate in history, and at the other Federal Reserve banks to $1\frac{1}{2}\%$. The board also issued in Sept. 1937 a revised and liberalized regulation relating to advances and discounts by Federal Reserve banks for member banks, in accordance with changes in the law made by the Banking Act of 1935.

In Sept. 1937, at the request of the board of governors, the Treasury released \$300,000,000 of gold from its inactive account and at the same time the Reserve System announced that it would be prepared to buy additional Government securities in order that seasonal demands for currency and credit might not have the effect of tightening credit conditions. The release of gold was made by the Treasury about the middle of September and as the proceeds were immediately expended, excess reserves were increased to over \$1,000,000,000 again, and have remained substantially above that figure ever since. In November the System increased its holdings of Government securities by about \$38,000,000.

Effective Nov. 1, 1937, the board of governors increased the amount of credit that both banks and brokers were permitted initially to extend on securities from 45% to 60% of their current market value.

In Feb. 1938, the Treasury modified its gold policy by providing that from Jan. 1, 1938, gold acquisitions up to \$100,000,000 in any one quarter of the calendar year would be incorporated in the monetary system, and that only the excess above this amount should be placed in the inactive account. In April the Treasury discontinued the inactive gold account entirely and deposited with the Federal Reserve banks approximately \$1,400,000,000 of gold certificates and in this way "desterilized" the gold previously held in the inactive account. At the same time, the board of governors reduced member bank reserve requirements by about one-eighth, or approximately \$750,000,000.

In the early summer of 1939, the System allowed its holdings of short-term Treasury bills to decline by about \$140,000,000 by not replacing bills as they matured. This action was in response to technical conditions in the bill market, where rates had declined to practically a no-yield basis, and did not mark a change in general credit policy.

With the outbreak of war in Europe in early September, long-term Government bonds declined sharply. From August 30 to September 20 the Federal Reserve System increased its open-market holdings by \$400,000,000 and on September 1 the Board of Governors announced that in view of developments in the international situation, the Federal Reserve banks were prepared to make advances to nonmember banks on Government obligations at par, on the same terms as are accorded member banks. Discount rates on advances secured by Government obligations were reduced by a number of Federal Reserve banks. With firmer conditions restored in the bond market, the System again allowed its holdings of Treasury bills to run off and sold some of its notes and bonds, with the result that by the end of November the System's total holdings of United States Government obligations had declined by nearly \$300,000,000 from the peak in September and were smaller than they had been in the early part of the year.

Although the war, if prolonged, will profoundly affect many aspects of our economy, its outbreak produced no repercussions on this side of the Atlantic comparable to those of 1914, when the stock exchange and many commodity exchanges were forced to close. At that time, heavy withdrawals of currency and gold forced banks to operate on a restricted basis, while business generally suffered a sharp decline in activity. In contrast, during recent months all exchanges have remained open, bank deposits and reserves have increased, while commodity prices and business activity generally have advanced to near post-depression highs.

In view of the present volume of excess bank reserves, which is

larger than ever before, and of other idle funds in the hands of investors, the outlook is for the continuance of extremely easy money conditions. While there is no immediate prospect of an inflationary expansion of credit, from a long-term point of view the existing large volume of excess reserves, which shows no prospects of diminishing in the period immediately ahead, provides the basis for a potential expansion in credit and constitutes a possible threat to future economic stability. Should circumstances arise which might precipitate such an injurious expansion, the Federal Reserve authorities would need additional powers to deal with the situation. (See also BANKING.) (M. S. E.)

Federal Surplus Commodity Corporation: see BUTTER.

Federated Malay States, area 27,540 sq.mi., population (1938) 2,089,835, are one of the three main subdivisions of British Malaya, the others being the Straits Settlements and the Unfederated Malay States (*q.v.*). There are four Federated Malay States, Perak, Selangor, Negri Sembilan and Pahang, of which the first three are on the west coast of the Malay Peninsula, while Pahang is on the east coast. Each State is administered under the advice of a resident, who is subject to the instructions of the High Commissioner, who is also governor of the Straits Settlements. Present governor: Sir Thomas Shenton Whitelegge Thomas. The seat of the Federal Government is at Kuala Lumpur (Selangor), the largest town in the States, with a population of 127,124. The Federated Malay States contain 1,068mi. of railway and 2,916mi. of metalled roads. They constitute the immediate hinterland of the two main ports of the Straits Settlements, Singapore and Penang, and are rich in minerals and raw materials, especially tin and rubber. Other important products are coco-nuts, oil palms, rice and pineapples; and there are deposits of coal and gold. Chinese labour is largely employed in the tin mines and there are many Indian workers on the rubber plantations. The Malays devote themselves more to hunting, fishing and agriculture. The area under rubber amounts to 1,625,000 acres. The mines of the States in 1937 produced 75,393 tons of tin, 33,828oz. of gold, 863 tons of tungsten and 627,890 tons of coal. Imports were £11,272,459 in 1936 and £15,281,295 in 1937. Exports were £28,611,747 in 1936 and £41,500,942 in 1937. The revenue of the States in 1937 was £9,434,202. (W. H. CH.)

Federation of Labor, American: see AMERICAN FEDERATION OF LABOR.

Feldspar. Almost the entire commercial utilization of the feldspars is in the ceramic and glass industries. The United States is the world's largest producer and consumer, followed by Sweden, China and Norway, with a number of minor producers. World production is of the order of 400,000 to 450,000 metric tons, of which the United States contributes nearly two-thirds. The 1938 consumption in the United States was 214,514 short tons, 4% of which was imported from Canada, about 55% in glass, 34% in pottery, 9% in enamel and sanitary ware, leaving 2% for miscellaneous uses, most of which are of a ceramic character. (G. A. Ro.)

Fencing. Loyal Tinghley, an undergraduate at the University of Chicago, fought to a victorious finish in the National A.A.U. championship at the San Francisco Golden Gate Exposition. He dethroned José R. de Capriles, the 1938 épée champion, in masterful style.

Another young collegian, Normie Lewis, wearing the colours of the Salle Santelli, of New York, earned premier honours with the foil over Dernell Every, of the New York A.C. Only one seasoned

contender—Norman Armitage, of the Fencers Club, of New York—bested the veteran, Dr. John R. Huffman, the defending sabre champion, of the N.Y.A.C. Team honours were scattered: Foil, Salle Santelli; épée, Fencers Club; sabre, N.Y.A.C.

Outdoors, the national championship titles fell to José R. de Capriles in the three-weapon competition; Armitage took the sabre title, and Tracy Jaeckle, of the Fencers Club, captured the épée title. The three-weapon team crown was won by the Santelli fencers. Miss Helene Mayer, of Oakland, Calif., who caused a furor when the Nazis refused her entry in the 1939 Olympics in Berlin because of being a Jewess, and then turned right about, won her fifth national championship fencing title. In the Intercollegiate Fencing Association championships Army and Navy ruled in typical style. Vincent De Poix, of the U.S. Naval Academy, won the foils; Salvatore Manzo, of the U.S. Military Academy, captured the épée title; Abraham Campo, of Navy, was the best with the sabre. Navy took the foil, épée and three-weapon team titles, and Columbia salvaged the sabre team crown.

Fertilizers. European wars are materially affecting the world production and consumption of fertilizer materials.

In the United States, Government competition with private industry continues through the manufacture of concentrated superphosphate by the Tennessee Valley Authority.

World consumption of nitrogen in fertilizers reached 2,492,000 tons in the year ended June 30, 1938, the highest on record. Other plant food consumption was also on the increase. The onset of war in Europe in the late summer of 1939, with its blockades and munitions requirements, changed the picture. Nitrogen, the basis of most explosives, was requisitioned in large quantities for that use. Its use on the land in warring countries was severely rationed. Land use of potash and phosphates was also regulated. Potash produced in Germany came under the ban of the British blockade. Shipping for French-produced potash was difficult to obtain. American-produced potash was kept for domestic consumption. Phosphates from North Africa and America were barred from Germany by the blockade and their transportation was difficult for other nations.

Reduction in man power for agriculture resulted from mobilization in nearly all European countries. This combined with the necessity for increased food production for the augmented armies of the world, demanded maximum acre production. Increased consumption of fertilizers in belligerent nations was thus desirable, but in many cases impossible, because of scarcity of supply.

World resources of plant food are now known to be much greater than were believed to exist during the World War (1914-18). Fixation of atmospheric nitrogen provides inexhaustible supplies of that element. Discovery of additional deposits of potash outside Germany and of many large deposits of phosphate in various countries has greatly increased the known sources.

Financial Review. Up to the outbreak of war in Europe, financial and general business conditions throughout the world were, at least on the surface, generally satisfactory. World industrial production, which by the end of 1938 had recovered a major portion of the decline sus-

tained in the 1937-38 depression, remained at a comparatively high level. Exclusive of the United States, world industrial production reached new high records in the second quarter.

In the United States, recovery from the 1937-38 depression was interrupted by a recession lasting from Dec. 1938, until May 1939. Thereafter there was an expansion of industrial production to a level at which nearly all of the recession had been recovered.

In England, the trend of industrial production was governed largely by preparations for war. Consequently, industrial production rose gradually but continuously up to the time of the declaration of war on Germany. In France, the influence of preparation for war was even more pronounced. France had experimented with the practical application of certain socialistic doctrines, to the visible detriment of her internal prosperity and capacity to produce. With the peril of hostilities approaching, France threw overboard these restrictions and went heartily and unitedly to work on armament, whereby the index of industrial production for France, up to the outbreak of the war, showed the steepest rise of that of any European country.

Industrial production in Germany reached a new high record in the first quarter. Thereafter, however, despite territorial expansion, the German industrial machine was unable to increase the output of goods, which is a rather remarkable commentary on the National Socialist economic system in view of the increasing need for war materials to support Hitler's defiance of other countries. A similar fate seemed to befall Japan. Although industrial output reached a new high record, the rate of increase, as the year progressed, became small, despite Japan's territorial expansion and her reluctance to end her military adventures.

On the whole, however, the year, up to the outbreak of war, was a period of increasing industrial activity throughout the world, in the smaller as well as the larger countries. Poland, for example, reported a new high record in industrial activity a few months prior to the German invasion.

Notwithstanding this apparently favourable statistical situation, the financial situation in the United States, even before the peace was finally shattered, was not considered especially satisfactory. The business recession of the first and second quarters was of course a factor in depressing financial sentiment, but it was not the main factor. The main factor was a recurrence of European crises. The Munich crisis of Sept. 1938, had taken a heavy toll in Wall Street, but the Czech crisis in March 1939, proved to have an even more depressing effect, and stock prices declined to the lowest level since June 1938. Throughout this

INDUSTRIAL PRODUCTION, U.S. and World: 1928=100; adjusted for seasonal variation (The Annalist)

period, American stock prices proved particularly vulnerable to events abroad; at times, indeed, stock prices in New York were weaker than in London. Investors were apprehensive that war would touch off heavy foreign selling of American securities.

The visible improvement in industry and trade, and the accompanying firmness in raw material prices, which characterized the period from May to August, was reflected in a moderate rise in the stock market; but the feebleness of this movement is emphasized by the fact that at the end of July, when the rise culminated, the level of stock prices was some 12% lower than the best level reached in 1938, although the business outlook was becoming increasingly favourable.

From early July to the end of August the financial markets were dominated by the implications of the darkening war clouds over Europe. Based largely on the sequence of events upon the outbreak of the World War in 1914, the prevailing view on the probable consequences of the outbreak of another war was one of pronounced gloom. The New York Stock Exchange, the Securities and Exchange Commission and Washington officialdom had already, in April, drawn elaborate plans for meeting what was expected to be a major calamity, in the event of an actual outbreak of hostilities. *The Annalist* average of 90 stocks declined from a high of 49.0 on July 18, 22 and 25, to a low of 41.0 on September 1. General business activity, which had revived considerably in June, failed to expand further.

The German invasion of Poland and the declarations of war by England and France, however, furnished one of the greatest surprises in modern financial history. Instead of declining, as on the occasion of the outbreak of war in 1914, stock prices rose sharply. Raw material prices soared. There was a severe decline in high grade bond prices, including United States Government bonds. Business activity expanded rapidly as orders poured in to manufacturers from consumers who became alarmed over the danger that the demand for goods for armament purposes would create a shortage of available supplies. The railroads experienced one of the sharpest upturns in traffic in their history. For a few days there was an actual shortage of freight cars.

The extent of this buying movement may be judged from the fact that the National Industrial Conference Board's index of new orders received by manufacturers rose from 90 in July and 96 in August to 164 in September. *The New York Times* weekly business index advanced from 92.3 for the week ended August 26 to 102.0 for the week ended September 30.

INDUSTRIAL PRODUCTION, Europe: 1928=100

"GIDDYAP." The problem of idle capital in 1939, neatly illustrated by Talburt of *The New York World Telegram*

The Bureau of Labor Statistics wholesale commodity price index advanced from 74.8 to 79.5 in the same interval. Its index of raw material prices advanced from 66.2 to 73.1; of semi-manufactured goods prices from 74.4 to 83.7. *The Annalist's* index of cyclical industrial raw material prices, which is composed of items peculiarly sensitive to changes in the demand for raw materials entering into the manufacture of producers' durable and semi-durable goods, advanced from 63.6 to 84.2. A tremendous wave of buying swept the markets for steel, the nonferrous metals, and textiles. Orders for some items of railroad equipment reached the highest totals in 16 years.

One of the most curious aspects of this sequence of events was the circumstance that many usually well-informed economists and statisticians, even up to the middle of August, had refused to concede the probability of a major European conflict. For that reason, in the belief that war if it did come would cause a severe decline in stock prices, they had not recommended the sale of stocks. Consequently those economists and statisticians who were dead wrong on war prospects were dead right on stock market prospects, whereas those who correctly forecast the outbreak of war were, in general, wrong on the market outlook.

This curious situation, however, was soon to be reversed by another surprising development. Just as investors and speculators had adjusted themselves to the probability of an immediate war boom of greater or less intensity, partly in the belief that the arms embargo section of the Neutrality Act would be repealed, the boom in the stock market subsided. The boom lasted only until September 13; and the stock averages not only failed to reach the Nov. 1938 top, but failed by a narrow margin to establish a new high record for 1939. Thereafter, stock prices, except for a moderate advance in aviation stocks, moved horizontally until October 26, when an extremely gradual decline began which lasted until

the end of 1939.

The failure of stock prices to advance in the last quarter was the third major surprise of the year to experienced financial observers, because business activity continued to expand until the middle of November and thereafter held at the advanced level until the end of the year. In the past there had been many occasions on which stock prices had failed to advance parallel with important advances in business activity; but never in the financial history of the country had there been such a pronounced divergence. In the past, the divergencies could be attributed to extraneous influences, such as changes in the level of interest rates. But in the fourth quarter of 1939, after the subsidence of the first shock of the war, the money market eased almost as rapidly as it had tightened; so that by the end of 1939 Treasury bonds were selling almost as high as in May, when they sold at the highest prices in the history of the country; and high-grade utility and industrial bonds had recovered practically all their September declines.

The failure of stock prices to advance was considered all the more remarkable in view of the circumstance that the volume of industrial production, as measured by the Federal Reserve Board's index, in November reached 124, which was only one point lower than the all time high record established in 1929. Steel ingot production, adjusted for seasonal variation, increased to a new high record for all time in October. The demand for some of the leading raw materials of industry, such as the nonferrous metals, cotton, hides and leather, and rubber, reached exceptionally large proportions. Unfilled orders for steel, textiles, and other important commodities at the end of the year were generally believed in informed financial quarters to be sufficient virtually to guarantee a high rate of general business activity well into 1940.

Financial sentiment remained depressed despite these favourable indications. Foreign selling of American securities was at no time exceptionally heavy, but it persisted in considerable volume, generally estimated at from 5 to 10% of total volume; and it represented, of course, one-way traffic, with little or no offsetting foreign purchases. There were persistent peace rumours, which Wall street interpreted as bullish from a long-range standpoint but bearish on the immediate outlook. Except for substantial orders for aircraft, motor trucks, and a number of items of technical apparatus coming under the head of munitions, the volume of so-called war orders was less than had been expected when the arms embargo was repealed. The Allied commissions charged with the duty of procuring supplies in the United States proceeded with exasperating deliberation. The fact that the Allies were prohibited by the Johnson Act from borrowing in the United States made it necessary for them to follow a policy of extreme caution in order to conserve available purchasing power. The initial successes of the German naval campaign disrupted shipping schedules and for a time raised cargo insurance rates to almost prohibitive levels.

BUSINESS ACTIVITY in the United States: Annalist composite monthly index

"OF COURSE, IT'S A LITTLE DANGEROUS." Herblock of NEA Service pictures the U. S. war boom which began in Sept. 1939

Shipping difficulties were intensified by the so-called cash-and-carry provisions of the Neutrality Act as amended by the special session of Congress. Investment buying of securities was restrained by the recollection that during the World War (1914-18) stocks had sold at comparatively low price-earnings ratios.

Some prominent industrialists who were opposed to the New Deal said that the industrial boom was unsound and could not last. Some prominent New Dealers said the same thing; and whereas throughout the early years of the New Deal every effort was made to promote rising commodity prices, throughout the early days of the war the New Dealers, both as individuals and through various agencies such as the Temporary National Economic Committee, said that drastic steps would be taken if necessary to prevent "profiteering." Fear of such measures was believed to have been an important factor in the decision of the steel companies not to advance finished steel prices, although there had been sharp increases in their operating costs owing to higher scrap prices and high wage rates. All this proved confusing to investors, who also feared the imposition of heavy "war-profits" taxes if the boom continued. Finally, the character of the war itself, involving almost no activity on the Western Front, was such as to deter investors from making commitments. New financing, except for some refunding, remained dormant, as it had been throughout the year.

There was considerable apprehension both in financial and governmental circles lest the industrial boom, because it was touched off by a sharp rise in raw material prices, would lead to a repetition of the 1937 collapse when inventories became glutted through over-enthusiastic anticipation of an endless chain of price increases. Statistics compiled by the National Industrial Conference Board, however, showed that up to the end of October no undue accumulation of inventories had occurred.

Part of the uncertainty over the outlook was attributable, in all probability, to the fact that the improvement in business activity was most pronounced in the heavy industries and in those

associated during the World War with war orders. As the year drew to a close, however, it was seen that this was probably a normal development; that the expansion in other sectors of the national economy would eventually follow and round out the picture. Hence, although there had been considerable comment to the effect that production was outrunning consumption, retail trade spurted in November, after about the usual lag behind industrial production. Employment and payrolls also increased rapidly, although with a customary lag behind the rise in industrial production. There were some increases in wage rates, making them the highest, on the average, in the history of the country. Some manufacturers with heavy backlogs of unfilled orders gave wage increases to forestall labour trouble, in the belief that the cost of living would increase and create renewed demands for higher wages. The cost of living rose in September, but moderately; and later developments showed that expectations of a perpendicular rise in retail prices, similar to the one that occurred in the World War (1914-18), had, for the time being, been falsified.

The labour situation improved, by and large. The worst strike was one against the Chrysler Corporation, which lasted several weeks and interfered seriously with the production and marketing of 1940 Chrysler products. Except for the strike, total automobile production, seasonally adjusted, would probably have reached a new all-time high record in November. Automobile sales remained brisk, for the season, to the end of 1939. The fact that there was such heavy demand for automobiles and other consumers' durable goods, and for commodities remotely connected with the changed situation brought about by the war, seemed in considerable measure to diminish the force of the argument that the industrial boom was temporary. It seemed, on the contrary, to strengthen the argument that industrial recovery in the United States was already well under way when the war broke out, and that the outbreak of war merely accelerated the recovery.

This acceleration, moreover, was widespread. It affected the agrarian as well as the industrial areas. Wheat prices advanced sharply on the outbreak of war. Subsequently, when there was general realization of the seriousness of drought conditions in the wheat belt, wheat futures at Chicago sold above \$1 per bushel for the first time since 1937. Cotton prices and other farm products, with the notable exception of cattle and hogs, advanced. Cash farm income, which had remained at the moderate 1938 level through the summer, increased in September and October.

With Europe at war, economic statistics for the latter part of the year were not available. There were indications, however, that the German industrial machine was standing the war strain none too well. Although the strain of financing another war on top of the unliquidated debts from the last war was a heavy burden for England and France, the necessary steps both for increased taxation and additional borrowing proceeded in an unexpectedly orderly, systematic and determined manner. The pound sterling declined from about \$4.48 on August 24 to \$3.73 on September 15, then recovered to about \$3.95. The French franc declined from about 2.65¢ to 2.10¢, then recovered to about 2.24¢. Dollar exchange rates on leading neutral countries remained remarkably steady. Although American exports to Germany reached the vanishing point, there were indications that some neutrals were transshipping American and other exports to Germany, as happened in the World War. American exports to all countries increased sharply in September and October but declined in November. American exports to South America increased sharply. Steps were being taken toward the end of the year by Government officials to finance increased trade with South America, although some observers in the financial districts believed that trade opportunities there were being exaggerated.

National debts again increased in all major countries. The net

debt of the United States increased at an unprecedented peacetime rate, despite increased business activity which relieved the Treasury of some of the unemployment relief burden. Declining work relief and public works expenditures were more than offset by sharply increased expenditures for farm benefits and for national defence. There were rumours that the President would make an attempt to balance the budget, or come closer to a balance, in fiscal 1941; but nobody seemed to take the rumours very seriously. (See also CANADA; COST OF LIVING; EXCHANGE RATES; EXCHANGE STABILIZATION FUNDS; EXPORTS AND IMPORTS; GOLD RESERVES AND GOLD STANDARD; INTERNATIONAL TRADE.)

(D. W. E.)

Finck, Herman (1872-1939), British composer, was born in London on November 4. After studying music at the Guildhall school, he became a pianist and violinist at the Palace theatre, where he was musical director from 1900 to 1921. From 1922 to 1931 he was musical director of the Theatre Royal, Drury Lane. A prolific worker, Finck wrote the music for dozens of revues, comic operas and operettas. His compositions included also many pieces of incidental music, overtures and songs. He died in London April 21.

Finland. Area (including inland waters) 147,811 sq.mi.; pop. (est. Dec. 31, 1938) 3,863,756. Chief towns (pop. est. Dec. 31, 1938): Helsinki (cap. 304,965); Viipuri (74,247); Turku (74,315); Tampere (76,730). President: Kyösti Kallio; language: Finnish (Swedish 10%); religion: Lutheran Christian.

History.—The advent of 1939 was received in a spirit of optimism tempered with circumspection. Though Munich had failed to bring about real appeasement, yet leading political circles in Finland were disinclined to countenance the view that Hitler was bound to force the issue. The ten years' non-aggression pact between Finland and Russia, signed in 1934, had yet another five years to run, and so Finland felt justified in pushing on with the preparations for the Olympic games, which were to take place in Helsinki in the summer of 1940.

As the year wore on, however, anxieties deepened, notably since it became known that Russia had put forward far-reaching territorial claims on Finland as part of her reward for signing the Anglo-Russian pact for which negotiations were proceeding: and all through the summer a number of precautionary military measures were carried out in order that events should not take Finland entirely by surprise. The Finnish cabinet was in the main the same as had assumed office on March 13, 1937—essentially a coalition of the parties of the left, with M. Cajander (Progressive) as prime minister and M. Tanner (Socialist) as minister of finance. The portfolio of foreign affairs had been taken over by M. Erkko (Progressive) in succession to M. Holsti.

On the outbreak of the war between the Allied Powers and Germany, Finland like the other Scandinavian states immediately declared her strict neutrality. Russia, having first invaded Poland and next established a complete dominance over the three small Baltic republics, Estonia, Latvia and Lithuania, shortly afterwards issued (October 5) an ominous invitation to Finland to send a delegation to Moscow for the purpose of discussing certain political questions affecting the two countries. Finland accepted the invitation, and sent as her chief delegate, Dr. Paasikivi, Finnish minister at Stockholm, and one of the architects of the peace concluded between Finland and Russia in 1920, adding to the delegation later M. Tanner, the Socialist minister of finance.

Russia's proposals were communicated to Finland on October 14. They included the demand for a 30 years' lease to Russia by Finland of the port of Hangö in south-west Finland, and a territory adjoining thereto, to be used as a naval base, Russia being also entitled to keep at Hangö a garrison not exceeding 5,000 men

in number. Finland was further to cede to Russia certain islands in the Gulf of Finland—Hogland (Suusaari), Seiskari, Lavansaari, Tytärsaari, and Björkö (Koivisto); part of the isthmus of Karelia, from the village of Lippola to the southern border of the village of Björkö, and, in the extreme north of Finland, in the district of Petsamo, the western part of the Fishermen's peninsula, on the Arctic ocean, in all some 2,761 square kilometres. In exchange, Finland was to receive from Russia, territories to the north of Lake Ladoga, in the districts of Repola and Porajärvi, totalling 5,529 square kilometres. Apart from these territorial questions, the existing non-aggression pact between Finland and Russia was to be supplemented by a clause binding the two contracting parties not to join any groups or alliances directly or indirectly hostile to either of the contracting parties. Moreover, the fortified zones on both sides of the Finno-Russian frontier were to be suppressed; and finally Russia declared her willingness to allow Finland to fortify the Aaland islands by herself, no foreign power (including Sweden) being entitled to a share in this work.

These demands were carefully examined by the Finnish Government which on October 23 presented counter proposals to Moscow. These were marked by a very conciliatory spirit. They provided for the cession to Russia of most of the islands in the Gulf of Finland claimed by her; for an adjustment of the frontier on the Isthmus of Karelia—against compensation in both cases; and met the suggestion regarding the supplementing of the non-aggression pact in a sympathetic spirit. Only as regards the Russian demand for the port of Hangö was Finland constrained to return a negative answer, since a cession of this particular portion of her territory would be incompatible with Finland's neutrality.

After this first exchange of proposals, negotiations were continued for about three weeks, various alternatives being explored. Agreement proved, however, impossible to attain, and on November 13 the Finnish delegates left Moscow, expressing the hope that future negotiations might be continued with a result satisfactory to both parties. The Soviet press and wireless now launched a violent campaign against Finland; and on November 26 it was alleged that Finnish artillery had fired on Soviet troops stationed in the vicinity of the village of Mainila on the Karelian isthmus. Finland had no difficulty in refuting this allegation, but proposed that the matter should be investigated jointly by Finland and Russia and that meanwhile both powers should withdraw their troops from the frontier. This was countered by a unilateral denunciation, on the part of Russia (November 28) of the existing non-aggression pact, in clear defiance of the procedure laid down

in the pact in question. In spite of this rebuff, Finland persisted in her conciliatory attitude, making (November 29) various proposals (including one for neutral arbitration) aiming at a peaceful settlement of the difference which had arisen. Before the Finnish minister in Moscow had been able to transmit the proposals to the Russian Government, the latter had, however, on the same day, November 29, broken off diplomatic relations with Finland. The Finnish representative found, nevertheless, means of conveying the proposals of his Government to the Commissariat of Foreign Affairs in Moscow, in the early hours of November 30. It was, therefore, with full cognizance of Finland's willingness to investigate, that Russia, without an ultimatum, without a declaration of war, attacked Finland by air, sea, and land late in the day on November 30. The capital of Finland and many other localities were subjected to a ruthless bombardment from the air. On this very day the Government of the United States of America offered their good offices for a peaceful settlement of the conflict; Finland, although the aggrieved party, gratefully accepted the offer, whereas Russia rejected it. On December 1, the day after the invasion, the Finnish Government was reconstructed as a Cabinet of National Union, all parties being represented in it: M. Cajander was succeeded as prime minister by M. Ryti, governor of the Bank of Finland, and M. Tanner, the former minister of finance, took over the portfolio of foreign affairs. Already the day before, Finland's national hero from her war of independence in 1918, Field Marshal Mannerheim, had been appointed commander-in-chief of the Finnish Army.

Meanwhile, in these crowded days a characteristic manoeuvre had been performed by the Soviet Government. No sooner had Russia invaded Finland, than she gave it out to the world that a "People's Government of Finland" had been set up in the Finnish bathing resort of Terijoki, close to the Russian border. This puppet government consisted wholly of exiled Finnish communists; at its head was Otto Kuusinen, notorious as one of the signatories to the famous Zinoviev letter, addressed in 1924 to the Central Committee of the British Communist Party. This "government" hastened to grant Russia all she asked for in Finland; and when on December 4 the Swedish minister to Russia transmitted to Moscow fresh proposals for negotiations, emanating from the legal Finnish Government, he was told that the only Finnish Government hereafter recognized by Russia would be the puppet cabinet of Terijoki. (See EUROPEAN WAR.)

The indignation, felt all the civilized world over at the brutal aggression against Finland, found striking expression in the action of the League of Nations. Finland having appealed to the League for assistance, the Council of the League, sitting at Geneva, voted the expulsion of Russia from the League of Nations on December 14. On this occasion, both the British and the French representatives announced the intention of their Governments to extend every possible help to Finland. Large amounts of money destined to help Finland were raised by public subscription in Scandinavia, in Great Britain, and in the United States.

The end of 1939 saw the Russian onslaught stemmed by the Finnish Army with remarkable success. The vital system of defence across the Karelian isthmus, known as the Mannerheim Line, had been at no point penetrated by the Russian forces; to the north of Lake Ladoga, the Finnish troops had not only repulsed the Russian attacks but had crossed into Russian territory; and still further north, the fight was continuing in a manner which augured well for Finland's power of resistance. Everywhere, the Russian losses, both of men and of war material, had been considerable; and the repeated air raids on the cities of Finland had entirely failed to break the spirit of the Finnish people. (T. Bs.)

Education 1937-38:—Elementary schools 11,565; scholars 407,146; secondary schools 218; scholars 52,296.

BARON CARL GUSTAV MANNERHEIM, chief of Finland's defence forces, met frequently with his council late in 1939 as his nation mobilized for an invasion by Russia

Banking and Finance.—Revenue, ordinary (est. 1939) 4,502,200,000 markka; expenditure, ordinary (est. 1939) 3,475,900,000 markka; public debt (Dec. 31, 1938) 3,673,500,000 markka; note circulation (Aug. 31, 1939) 2,262,000,000 markka; gold reserve (Aug. 31, 1939) 1,183,000,000 markka; exchange rate (up to Aug. 26, 1939): 226½–227 markka=£1 sterling.

Trade and Communication.—External trade in 1938 (merchandise): imports 8,607,300,000 markka; (Jan.–Aug. 1939) 5,480,700,000 markka; exports 8,398,000,000 markka; (Jan.–Aug. 1939) 5,759,600,000 markka. Communications: roads, State (1938) 20,235mi.; railways, State (1938) 3,670mi.; shipping (June 30, 1939) 626,000 gross tons; motor vehicles licensed (July 31, 1939): cars 29,675; commercial vehicles 22,860; cycles 7,677; wireless receiving set licences (1938) 293,896; number of telephone subscribers (1938) 7,720.

Agriculture, Manufactures, Minerals.—Production 1938 (in metric tons): wood pulp 2,110,000; oats 826,000; (1939) 798,000; rye 369,000; (1939) 331,000; wheat 256,000; (1939) 227,000; barley 207,000; (1939) 192,000; potatoes 1,198,000; copper 12,600; butter, creamery 33,000; beet sugar 13,600; superphosphates of lime 62,000. Industry and labour: number of factories (1937) 4,246; employees 207,506. Industrial production index (1929=100) (average 1938) 155.6 (average June 1939) 155.6. Employment index (1929=100) (average 1938) 109.0; applicants for work (average 1938) 3,602; (average June 1939) 2,091.

(W. H. WN.)

Fire Insurance: *see* INSURANCE, FIRE.

Fires and Fire Losses. The National Board of Fire Underwriters is the accepted authority for the statistics in regard to fire loss. For the year 1939 they place the amount of fire loss at \$313,498,840. This estimate is based on notices of incurred losses received by member companies with an allowance for unreported and uninsured losses. The 1939 losses show an increase of almost 4% over those of 1938 and about 10% over those of 1937. The losses during the month of January and the last four months of 1939 showed a drop from the corresponding months of 1938; all the other months showed gains, the largest being in June when the losses ran 24% over the losses in June 1938. One unusual feature of 1939 was the fact that the December losses were only slightly above those of November, whereas there is usually a large increase. The 1939 December losses were 14.5% below those in December of 1938.

During the year there were 3,080 fires, reported in the daily record of the *Journal of Commerce*, which involved losses of more than \$10,000 each. The total loss during 1939 resulting from these fires was \$130,096,970. It should be stated, however, that these figures include Canadian fires, whereas the figures given in the paragraph above do not.

For many years the fire loss has run comparatively low and it was predicted that that record would be offset by an upward trend. The last two years have shown that there is such a trend although so far it has been very moderate.

It is interesting to note that the middle west reports that the farm fire losses may be placed at \$112,000,000 for 1939. That is a substantial sum to be produced by only one type of risk and it is an increase of about 15% over 1938. No satisfactory explanation of this has been forthcoming and it is the more difficult to explain since there has been an unusual effort during the last few years to reach the rural sections of the United States with fire prevention education. (*See also* INSURANCE, FIRE.) (E. R. H.)

Fisher, Carl G. (1874–1939), American business executive and real-estate promoter, was born January 12 at Greensburg, Ind. In his youth he was a bicycle and auto-

mobile racer. Starting his business career, he organized the Prest-o-Lite company in 1904 and built this organization into a large corporation. He also helped establish the Indianapolis speedway and was reputedly the first to suggest, in 1912, construction of the coast-to-coast motor road which is now the Lincoln highway. While on a vacation at Miami in 1913 he visited the site of Miami Beach, which was then only a deserted swamp. Fisher developed it into a thriving resort city. He also planned and developed Montauk Point at the eastern tip of Long Island. He died at Miami Beach on July 15.

Fisheries. The fisheries of the world, according to the latest tabulations compiled by the U.S. Bureau of Fisheries, annually yield about 17,600,000 tons of 2,000lb. each, of food or products used in the arts and industries, with a value of about \$762,000,000. Of this amount, the fisheries conducted in the North Atlantic area by bordering countries produce about 7,500,000 tons, valued at \$376,000,000; with the production by Eastern North Atlantic countries amounting to 6,100,000 tons, valued at \$312,000,000 and by Western North Atlantic countries to 1,400,000 tons, valued at \$64,000,000. The species of importance taken in the North Atlantic area are herring, cod, haddock, mackerel, halibut, swordfish, crabs, shrimp and oysters. During 1939 a fishery for tuna, of various kinds, was continued in a commercial way off the North Atlantic coast of the United States. During recent years the abundance of several of the former species has declined, due to over-fishing or other causes. Recognizing that this is a serious threat to the livelihood of thousands of fishermen and shoresmen, steps have been taken by the Governments of various countries to conserve several of these important species.

On the Eastern North Atlantic the situation is particularly serious, since fishing vessels must now travel great distances from the home port to obtain a catch. These longer voyages entail increased costs, not only in the operation (fuel, upkeep, etc.) of the vessels, but also for icing or refrigerating the fresh fish brought to port. In an effort to improve conditions, various conservation and economic measures have been suggested. As regards conservation measures a convention was signed in 1937 on behalf of the Governments of Belgium, Denmark, Germany, Great Britain, Iceland, the Irish Free State, the Netherlands, Norway, Poland, and Sweden. This convention, among other things, regulates the size of the meshes of otter trawls and seine nets fished from vessels of the signatory countries in certain waters of the Eastern Atlantic. It was hoped that through regulations under this convention, the fish population on the grounds of the Eastern North Atlantic, especially in the North sea, would be replenished. However, because of the need for maintaining food supplies essential to the people of the British Isles, during the present war, vessels operating from ports in England and Scotland are being allowed to land and sell immature and small fish, a practice originally made illegal under an order in 1938.

As regards economic measures, various plans have been suggested or tried with several of the Eastern Atlantic countries. These are intended to promote the more orderly marketing of fish. Some have been aimed at lowering tariff walls and trade barriers; others, prior to the European war, at reducing the landings of fish to prevent market gluts; and still others at improving quality to promote consumption. In general, though, since the outbreak of the European war, fishing activities have been greatly hampered, causing a reduction in fish supplies. Many countries have requisitioned fishing craft for naval purposes.

On the Western North Atlantic fishing vessels, operating from New England, have had to fish farther and farther from the home port, because of depleted stocks nearer port. This has led to the construction of larger and more modern vessels of the otter

trawl type. In general these vessels are capable of making faster trips to the fishing grounds as some have speeds of 12 knots or more. These vessels also have improved facilities for refrigerating the fresh fish brought to port. In an effort to replete the haddock fisheries of the Western North Atlantic, especially on Georges Bank where depletion of this species has been more evident, operators of trawl vessels have adopted mesh of larger size in the cod end of the otter trawls, in order to allow juvenile fish to escape. Many of the trawlers fishing for haddock and cod are now using the mesh of larger size. The North American Council on Fishery Investigations hopes that this will be made a permanent arrangement by some form of international agreement between the countries prosecuting the haddock fishery of the Western North Atlantic.

As regards the economic fishery situation in the United States in 1939, efforts again were directed toward stabilizing the frozen fish trade. Early in the year there was an accumulation of surplus stocks in cold storage. This caused apprehension among members of the fishery industry. As in 1937 and 1938, the situation was brought to the attention of the U.S. Congress which late in summer enacted measures authorizing the Federal purchase of surplus frozen fish for distribution to relief clients. However, by this time the situation had been relieved by the effects of the European war in stimulating the fishery industry in the United States. Therefore the Federal Government did not effect a widespread program for the purchase of surplus fish as in previous years. On the Pacific coast the new tuna and pilchard fishery off Washington and Oregon was firmly established.

In Newfoundland, the plight of the fishers was given continued study in 1939 and measures were promulgated to improve their welfare. This consisted mainly of Government provision for outfitting the fishermen, in taking steps to improve methods for the curing and marketing of fish, and in developing export markets. Some inducements also were made by Newfoundland to attract fishery concerns from the United States to conduct operations on the Treaty coast. This culminated in the establishment of a fish filleting plant by New England enterprise and development of the herring fishery which supplies fish to a United States factory ship engaged off Newfoundland in the manufacture of fish meal and oil.

In the Maritime Provinces of Canada further progress was made during 1939 in the formation and operation of co-operative associations of fishermen. In addition a salt fish board was established by the Government in Nova Scotia to find new markets for salt cod and to financially assist fishermen whose salt cod is sold in the export markets.

Whaling.—For the past two decades, various nations of the world, notably Norway and Great Britain have been prosecuting the whale fisheries with renewed vigour. Operations have centred almost entirely in the Antarctic, where previous to this time little whale fishing was done, because of dangerous weather and ice conditions. With improved methods for capturing whales, however, and for their manufacture into oil aboard the large and staunchly built factory ships now used, these conditions have constituted no obstacle. The take in recent years has been enormous; for instance, during the period from the season of 1919–20 to the 1937–38 season, inclusive, 383,352 whales were captured in the Antarctic, from which 29,921,126 bbl. of oil have been produced, according to Reports XII and XIII (1939) of the Committee for Whaling Statistics, Oslo. One barrel of about 50 gal. equals $\frac{1}{2}$ ton. One ton equals 1,016 kg. or 2,240 pounds. From the same reports we find that during the 1937–38 season alone 46,039 whales were captured in the Antarctic fishery, from which 3,340,330 bbl. of oil were produced. Norwegian whaling accounted for 14,960 whales, with an oil production of 1,157,993 bbl.; British whaling accounted for 16,111 whales with an oil production of 1,153,365 bbl.; and

the whaling of other countries (especially Japan, Germany, Panama, United States, and others) in this area accounted for 14,968 whales with an oil production of 1,028,972 barrels. During the season 11,227 men took part in the Antarctic whale fishery, of whom 7,826 were Norwegians, 1,840 Japanese, 675 British, and 886 German. Preliminary figures indicate that during the season 1938–39 there were 38,321 whales taken in the Antarctic which produced 2,812,546 bbl. of oil.

Apprehension as to the future of the whale fishery, in the face of such intensive prosecution, led to concluding an international convention between 26 powers for the regulation of whaling. This became effective in 1935. While the regulations under this convention have afforded whales much-needed protection, experience gained in recent years has indicated that additional restrictive regulatory measures are needed from time to time. To accomplish this an international agreement for the further regulation of whaling was signed in London on June 8, 1937, on behalf of the Argentine Republic, Commonwealth of Australia, Germany, the Irish Free State, New Zealand, Norway, the Union of South Africa, the United Kingdom of Great Britain and Northern Ireland, and the United States of America. This is now in force. This agreement was further amended to restrict whaling as regards prohibiting the killing of humpback whales in the Antarctic, at a meeting in London in 1938. In 1939 another conference was called in London which recommended the extension of this prohibition for another year. (*See also OCEANOGRAPHY.*) (R. H. F.)

Fitzgerald, Frank Dwight (1885–1939), twice governor of Michigan, an office he held at the time of his death, was born at Grand Ledge, Mich., on January 27 and received his education at Ferris institute in Big Rapids, Michigan. He was committee clerk of the Michigan senate in 1913, proofreader in the house of representatives in 1915, and bill clerk in 1917. From 1923 to 1931 he was business manager of the Michigan State Highway department, and from 1931 to 1934 secretary of State. He was the only Republican in a Michigan State office to survive the Democratic landslide of 1932. He was governor of Michigan from 1935 to 1936 but was defeated for re-election by Frank Murphy. Fitzgerald in turn defeated Murphy for the governorship in the election of Nov. 8, 1938. Inaugurated on New Year's day, 1939, he set out to redeem his campaign pledge of outlawing sit-down strikes in Michigan. His labour bill was passed by the State Assembly on March 16, the day he died at his home in Grand Ledge.

Floods and Flood Control. *Federal.*—The general Flood Control Act of June 22, 1936, established for the first time in the history of the Federal Government a definite policy for Federal participation in the construction of flood control projects throughout the nation in co-operation with the States, political subdivisions thereof, and other responsible local agencies.

Under the provisions of this Act, local interests were required to furnish lands, easements and rights-of-way for all flood control structures, hold and save the United States free from damages during construction, and maintain and operate the works after completion. The Flood Control Act approved June 28, 1938, provided that all lands, easements, and rights-of-way for reservoirs or channel improvement, or channel rectification projects, shall be acquired in fee by the United States and be a part of the Federal cost of the project.

Construction on 114 Congressionally authorized flood control projects has been completed or is now under way. Also, surveys and the preparation of plans and specifications are in progress for dams and flood protection projects at numerous localities throughout the United States.

In New England, construction has been initiated on reservoirs in the Merrimac and Connecticut river basins and substantial progress has been made on the construction of levees and flood walls at principal cities along the Connecticut river in Massachusetts and Connecticut.

In the Ohio river basin above Pittsburgh construction of Tionesta creek dam has advanced to 75% of completion, Crooked creek dam to 85%, and construction has been initiated on Mahoning and Loyalhanna dams. Channel enlargement on the Conemaugh river at Johnstown, Pa., is about 25% complete. Construction of local protection projects along the Ohio river has been completed at Section 1, Wellsville, Ohio, and is in progress at Ironton, Ohio; Huntington, Ceredo and Kenova, W. Va.; Tell City and Evansville, Ind.; Paducah and Middlesboro, Ky.; and Harrisburg, Illinois. Also, marked progress is being made on the construction of levees in the Wabash river basin.

In the Southwest, construction of Conchas dam on South Canadian river in New Mexico is virtually complete. Construction of the Fort Supply and Great Salt Plains dams in the Arkansas river valley in Oklahoma is well under way.

On the Pacific Coast the projects for flood protection at Los Angeles-San Gabriel river basins and the Santa Ana river basin, involving construction of reservoirs, debris control basins, dikes, and channel improvements are well advanced. Construction was started on Mud Mountain dam in Puyallup river basin, Wash., and improvements along the Columbia river and its tributaries in Washington and Oregon are progressing rapidly. Projects at eleven localities in this basin were completed in 1939.

(J. L. S.)

The United States in the year 1939 experienced the worst and most widespread drought in recorded history. A few floods occurred in certain areas, however, due to sudden, violent rainstorms. In September the muddy flood waters of the Alabama river spread over thousands of acres of fertile farm land and over 4,500 people were rendered homeless. The Alabama river alone caused crop damage estimated at many millions of dollars. Overnight the river reached the 53.9ft. level. The danger stage is the 47ft. level.

In southern California and Arizona, violent rainstorms called cloudbursts washed out highways and railroad tracks and thus interrupted traffic for over a week. A six-inch rain was suddenly deposited on the usually dry desert, causing sudden violent streams in usually dry gulches with disastrous results to highways and railroads.

During Sept. 1939, authorities estimated that 25,000,000 people faced starvation and suffering in China due to floods in the Hopeh province and the Yellow river basin. Fall crops were completely destroyed. The floods extended around the city of Tientsin for a radius of 50mi., while beyond this area the swollen rivers and creeks covered most of the central and southern province of Hopeh. Refugees were sleeping on strawstacks and farm animals were starving amid scenes of utter desolation.

In Dec. 1939 the district southeast of Manila in the Philippines was stricken with disastrous floods. Heavy loss of life occurred in the provinces of Isabella and Cagayan due to the flooding by the swollen waters of the Cagayan river.

Hundreds were homeless, much livestock was lost and there was heavy destruction of rice and tobacco crops in a wide area flooded by torrential rains which accompanied a typhoon.

Floods of this type occur on various portions of the earth's surface wherever similar geographical and climatic conditions prevail, such as on the Mississippi, the Hwang Ho, or Yellow river, the Ganges and the Nile. Such floods are caused by climatic conditions over which man has little or no control. They are largely seasonal and have occurred and are apt to occur at any time on the lowlands of such large rivers whenever the rainy season commences.

For example, heavy tropical rains occur on the headwaters of the Nile river in April and May, causing rise in the river often as much as three feet per day. The resulting flood stage invariably reaches a maximum at Assuan early in September.

Since the alluvial valley of the Mississippi has been formed by the flood waters carrying the silt from the higher elevations, floods must have always occurred on the Mississippi. Recorded floods of varying intensity have frequently occurred on the Mississippi during the past 150 years, but with no definite regularity. From 1785 to 1930, 30 major floods have been recorded.

Floods also occur due to unusual circumstances such as the breaking of dams constructed for impounding water, or to so-called cloudbursts. The Johnstown flood in Pennsylvania in 1889 was of this type. The Johnstown flood was preceded by torrential rains which caused the breaking of the dam above Johnstown on the Conemaugh river, resulting in loss of life and great destruction to property.

In the United States, during the year 1939, definite continued progress was made in measures for flood control. The 76th Congress appropriated \$133,000,000 for flood control. The National Resources Committee published comprehensive reports on their basin wide studies of flood control and allied multiple purposes projects of water control. The United States has been divided into 17 districts into which the various drainage basins of the country are grouped for convenience of study and planning. Much work was actually started, many plans were formulated and much information was obtained regarding the problem of these districts. In many of these districts in the northeastern part of the United States, the problem of flood control is intimately connected with that of pollution abatement, power development, sanitation and recreational opportunities. In all, the problem of soil erosion is important.

In the Tennessee valley a proposed system of dams upon the upper reaches of the river will provide complete regulation of the Tennessee river for navigation, flood control, and the development of electric power.

The upper Mississippi is characterized by a multiplicity of interlocking problems. Navigation, flood control, water-power, drainage, pollution abatement, surface and underground water supplies, recreation, wild life conservation, soil erosion, and siltation in streams, channels and reservoirs all are involved and most of them must be solved before flood control can be accomplished in this area.

There are many complex and conflicting interests involved in the utilization and flood control of the waters of the Colorado river. One unit in this control on the Colorado river, the Boulder canyon dam has been completed. The partial utilization of the waters from Boulder lake by the cities of southern California has been accomplished by the successful completion and opening of the Los Angeles viaduct. Other problems of the use of the waters of the tributaries of the Colorado in other States remain yet to be solved.

In the California area, problems of flood control are largely local problems, although problems of the abatement of pollution, navigation, and recreation problems are important. During 1939, definite progress was made to control the flood waters of the Sacramento river by the commencement of the construction of the Sasta dam for multiple purposes of flood control, power development, and irrigation.

Flood control is a major need of the Puget Sound area. It is proposed to control the flood waters of the Columbia river water system by the construction of ten major dams on the river water shed. Two of these, the Grand Coulee and Bonneville dams, are on the upper-most and lower-most reaches of the river.

The establishment of reservoirs on the headwaters of the various streams which make the main river are of immeasurable value in flood control and while the cost is very large, definite progress is being made in this direction.

Reforestation and improved soil management are vital problems not only as methods of flood control, and their wide adoption would have a pronounced influence on the prevailing state of the agricultural and lumbering industries. The correct solution of the problems presented by floods can only be obtained by a full and scientific understanding of all the contributing causes of flood disasters. Definite progress also has been made in solving the problems due to soil erosion. The introduction and practice of strip cropping, more sod and pastures, and terracing have reduced not only soil erosion but have reduced the damage due to floods in some areas. (See also SOIL EROSION and SOIL CONSERVATION; DAMS; FORESTS; METEOROLOGY.) (R. O. St.)

Great Britain.—In Oct. 1939 the exceptionally heavy flooding of 600 sq.mi. in the Midland area, caused by torrential rains and the overflowing of the Grand Union canal, was followed by the overflow of several rivers. Bridges were swept away, many houses flooded and great damage done to property. Among the flooded rivers were the Nene, Welland, and the Great Ouse, which flow through the Fenlands to the Wash. These floods, with unusually high tides in the Wash, would probably produce a flooding of the Fens, such as occurred in 1937-38, when there was a sea surge of about 4ft. above the highest known tide. In the Fenlands there is great activity in the work done to deal with these high floods which, although they occur at long intervals, cause serious damage to property and the valuable cultivated land, some of this land being many feet below the level of the river. For each of the Rivers Nene, Great Ouse, Welland and Witham there is a Catchment Board which is granted financial assistance by the Government for approved schemes.

The main method of flood control is the use of extensive Washlands consisting of reservoirs for the storage of water on the rivers. These Wash storages are controlled by sluices operating so as to collect water from the rivers during high tides and to discharge it into the Wash at low tides. In the Great Ouse, the principal river, which drains an area of 3,200 sq.mi., there are two systems of Wash drainage, one operating on the lower marshes and the other on the higher tributaries of the river.

Included in the work for the Nene are the improvement of the shipping facilities at Wisbech and the provision for sea-going vessels at Peterborough; in that of the Welland and the Witham, the cutting through of the outfall of the Welland to join the Witham at its point of discharge into Boston Deep.

Bulgaria.—Proposals have been made for the extension of the irrigation system in the valley of the River Mantza, where the soil for the most part is permeable loam. The annual rainfall being not more than 20in., there is an insufficient supply of water for the crops, consisting of cotton, tobacco, flax, and fruits, which constitute a greater part of the exports. The present irrigation system, controlling an area of 67,000ac., is inefficient and in-

adequate and should be extended to 370,000 or 500,000 acres. The river and its affluents provide the necessary water but, as their flows are subject to great variation, there is a pressing need for the construction of dams for the storage of water in the hills.

Greece.—Considerable progress is being made in the scheme for the protection of 3,700,000 stremmas (about 900,000ac.) of land in the provinces of Thessaly, Epirus and Boeotia in Greece and at Platania in Crete, the work which commenced in 1934.

Rivers are being widened and deepened, canals dug, protective embankments constructed to deal with floods. Thousands of square miles of land, now either under water or liable to floods, will be reclaimed for cultivation. In the Thessalian plains, for example, where a total area of about 430,000ac. have been subject to flooding, an additional 20,000ac. of protected land has been put under cereal crops for the 1939 harvest.

On the completion of the scheme, in about seven years' time, several towns and villages will be protected from flooding and an area of 150,000ac. added to arable land of a small hilly country, in addition to 750,000ac. being protected from flooding during the five winter months of rains.

Turkey.—On December 27 the first of a series of earthquakes devastated Anatolia, particularly in the east and north. A few days later, after torrential rainfall, there were heavy floods in western Anatolia, in the regions of Izmid, Brusa, and Smyrna.

A number of rivers overflowed their banks, sweeping away villages, inundating towns, and causing a considerable loss of life and property. Some districts were converted into vast lakes; in others, the rivers completely changed their courses. Troops, including sappers and miners, were sent to help in the rescue work and to attempt to dam the flood waters. The extent of permanent work in flood control required in this connection is, however, awaiting investigation.

Iraq.—An important irrigation project was completed by the construction of the Kut barrage across the River Tigris, near the town of Kut, in Iraq. The barrage has 56 openings, 19ft. 6in. wide, each controlled by a single sluice gate. The average flow of the Tigris at low water is 12,400 cusecs and at high water, where there is a rise in level of about 20ft., the flow is 140,000 cusecs.

A stream, the Shatt-el-Gharraf, which joined the Tigris immediately downstream of the barrage, is now diverted by the construction of a canal so that its mouth, where there is a regulator, is upstream of the barrage, the old mouth being closed by a dyke. The stream has long been used as a source of irrigation water for cultivation purposes, but during the dry season and in times of very low water it dries up.

Australia.—In Queensland, where the rain falls in intermittent heavy showers, there are frequent droughts which cause great losses to stock raisers; the average losses of sheep alone represents £1,500,000 per annum. A scheme dealing with the north-eastern area of the state has been suggested for the storage and the distribution of the flood waters at an estimated cost of no less than £30,000,000. Connected with this scheme is the development of hydro-electric power for lighting and industry and for pumping and irrigation.

Australia's Great Artesian basin has a total area of about 600,000 sq.mi., more than half of which is in Queensland. The flow from this basin is known to diminish at the rate of 2.5% per annum, although the water capacity is large, and it is possible that after the lapse of a few years the pumping of the water will have to take the place of artesian action.

In New South Wales the Burrinjuck dam for the storage of storm water, which was completed in 1913 and had a capacity of 772,000 ac.ft. of water, is being reconditioned at an estimated cost of £A 1,850,000; its capacity will be increased up to 815,000 acre feet. (See also IRRIGATION; METEOROLOGY.)

(J. Eu.)

Florida, extreme south-eastern State of the United States, is called the "Peninsula State" because of its peculiar outline. Its coast line is greater than that of any other State, extending 472mi. along the Atlantic and 674mi. along the Gulf of Mexico. Its total area is 58,666 sq.mi., of which 3,805 sq.mi. are water surface. Florida contains about 30,000 lakes, many of them connected by subterranean channels. Population (U.S. census, 1930) 1,468,211; (State census, 1935) 1,606,842; (Federal estimate, July 1, 1937) 1,670,000. Of the 1935 population 1,139,063 were white and 463,205 coloured; 989,743 were urban and 613,972 rural. Only about 45,000 were foreign born. The largest cities were Jacksonville, Miami and Tampa, with populations of 146,289, 127,600 and 100,151 respectively. Tallahassee, the capital, had 11,725.

History.—The present State elective administrative officers, whose terms expire in Jan. 1941, are Fred P. Cone, governor; R. A. Gray, secretary of State; George Couper Gibbs, who succeeded the late Cary D. Landis who died in his term of office on May 10, 1938, attorney-general; J. M. Lee, comptroller; W. V. Knott, State treasurer; Colin English, superintendent of public instruction; and Nathan Mayo, commissioner of agriculture.

Education.—At the head of the State school system is the superintendent of public instruction. The school revenue is de-

rived from a permanent school fund, special State and county taxes, the one-mill *ad valorem* tax and legislative appropriation on the teacher-pupil-unit basis, which yielded \$11,607,387, inclusive of \$309,083 for free text-books for the fiscal year, July 1, 1937–June 30, 1938. More than 3,300 students are enrolled at the University of Florida and about 1,800 in the Florida State College for Women. Municipally operated institutions of learning are: the University of Miami, the University of Tampa and St. Petersburg college. Rollins college and Southern college are privately endowed institutions. The last report of the State Superintendent of Public Instruction shows a total enrolment in the public schools of 396,824, of which 292,959 were in schools for whites, and 103,865 were in coloured schools. State appropriations for higher education for the year 1938–39 amounted to \$2,299,760.

Banking and Finance.—The last available figures on the State's financial condition, taken from the report of the State treasurer for the fiscal year ending June 30, 1939, show a total balance in the treasury of \$8,811,444.82. The total bank deposits in Florida national and State banks, on basis of last available figures (June 30, 1939), were \$311,247,000.

Agriculture, Manufactures and Minerals.—Agriculture is the most important industry in the State. In 1935, the year of the last State census, there were 72,857 farms with a total acreage of 6,048,406, of which 1,142,767 were in crops, 489,006 were idle (fallow), 2,362,674 were in pasture, 1,140,941 were in farm woodland and the rest mainly in fruit.

The more important crops for the 1939–40 season were:

	Acres	Production	Value
Oranges (including Tangerines)	35,000,000 boxes	\$35,000,000
Grapefruit	17,000,000 boxes	21,375,000
Tomatoes	38,400	4,948,000 bu.	12,230,000
Snap beans	64,000	7,135,000 bu.	7,041,000
Celery	7,300	2,184,000 crates	5,374,000
Corn (Maize)	805,000	6,038,000 bu.	4,347,000
Tobacco	32,500	23,410,000 lbs.	2,800,000
Irish potatoes	26,700	3,235,000 bu.	3,644,000

On Jan. 1, 1939, the livestock resources of the State were: 694,000 cattle, 111,000 milch cows, 566,000 swine, 37,000 sheep, 19,000 horses, and 41,000 mules. The more important manufactures of the State were lumber, naval stores (turpentine and rosin) and cigars.

In the 12 months season April 1938 to March 1939, Florida produced 7,440,090gal. of gum turpentine valued at \$1,660,000 and 505,000bb. (500lb. each) of rosin valued at \$4,450,000. Her 1938 lumber output was 700,000,000 bd.ft., mainly cypress and yellow pine, representing a value of nearly \$21,000,000.

The cigars manufactured yearly in Florida represent approximately \$20,000,000. Two comparatively recent industries are the growing of tung nuts and the production from them of tung oil, and the making of paper from pine pulp.

The State has only limited resources in minerals, but has large and valuable deposits of phosphates, lime and limestone, and less extensive, though highly valuable, deposits of kaolin and fuller's earth. The value of the phosphates produced in 1938, the last full year for which figures are available, was around \$13,000,000.

(J. M. L.)

Flour and Flour Milling. **Wheat Flour.**—The trend toward flours of a more creamy colour has progressed conservatively throughout the principal milling centres of the United States until at present there seems to be a general consumer acceptance of the longer extraction grades. While the swing toward richer breads reached and passed its peak during the summer of 1939, there seems to be little inclination on the part of either the millers or bakers to revert to the highly bleached short patent flours of a decade past.

The critical European situation has had virtually no effect upon the quality or quantity of wheat flour available to American consumers. Plentiful wheat reserves should tend to preserve this condition, and during 1940, at least, there seems small probability that the quality of American milled flours may be adversely affected either by increased exports or by changes in the United States' neutrality position.

Vitamized flours may soon appear upon the market if recent patents describing the addition of vitamin "C" derivatives to flour are credited with economic feasibility by the milling industry. British patent No. 503,476, issued June 30, 1939, describes the addition of ascorbic acid, sodium ascorbate or isoascorbate to flour in the form of a powdered mixture with an inert inorganic material, such as tri-calcium phosphate etc., or, with an inert organic substance such as starch. While the addition of vitamin containing supplements to bread formulas is not new, the present widespread interest in vitamins is likely to result in a more favourable consideration of flour vitamization by millers than has been shown in the past.

Flour Milling.—A recent compilation of data on milling capacities by the statistical department of the *Northwestern Miller & American Baker* (Vol. 16, No. 11, 1939) shows that Minneapolis

Flour Production Data for Buffalo, Kansas City and Minneapolis, 1936-1939
(*Northwestern Miller & American Baker*, Nov. 1, 1939, p. 48.)

Year	Number of Mills	Capacity Bbl. daily	Production Bbl. Annual
Buffalo 1936	7	49,000	10,425,335
1937	7	49,500	10,251,801
1938	7	49,500	10,200,421
1939	8	49,500	7,882,245*
Kansas City 1936	9	31,800	6,202,743
1937	9	31,800	7,332,452
1938	9	31,800	7,479,540
1939	8	31,800	5,441,893*
Minneapolis 1936	16	46,600	6,452,667
1937	16	43,150	5,681,400
1938	16	43,150	5,736,662
1939	15	30,150	4,214,267*

*Nine months only.

has yielded second place as an American milling centre to Kansas City, first place having been taken by Buffalo, N.Y., in 1930. Since reaching a production peak of 18,541,650bbl. in 1916, and a top capacity of 95,350bbl. per day in 1923, Minneapolis has steadily declined as a milling centre. Kansas City has maintained about the same daily capacity since 1926 with a fairly constant level of production of about 7,000,000bbl. per year throughout this period. In the meantime, milling operations at Buffalo have enjoyed a continuous advance, rising in daily capacity from 10,800bbl. in 1909 to the present maximum of 49,500bbl. in 1937.

Canadian flour production during the crop year ending July 30, 1938, was smaller in terms of percentage of capacity operation than at any time since 1932-33, having reached a low of 46.6% as compared with 51.1% for 1936-37, and 53.2% for 1935-36. The present trend is again upward, owing principally to increased exports to the United Kingdom which normally takes about one-third of the Canadian output.

In milling technology and research, emphasis is now on wheat conditioning and related subjects; humidity control, and air-conditioning. Recent investigations have established definite humidity levels required at the various stages of the milling process to maintain desirable moisture contents of the mill streams (C. O. Swanson, 1938-39).

High temperature tempering of wheat has been investigated by Hugo Kuhl, who in *Chem. Zeitung* (German), vol. 63, p. 469, 1939, presents data on new and original research in connection with high temperature-short time wheat treatment.

In the field of new products from wheat, the isolation and structural identification of new sterols from the non-saponifiable

portion of wheat germ oil represents one of the most important discoveries of 1939. (S. Bernstein, and E. S. Wallis, *Journal of the American Chemical Society*, July, 1939, p. 1903. Also see E. S. Wallis and E. Fernholz, *Ibid.*, 1939.) (See also VITAMINS.)

BIBLIOGRAPHY.—*The Northwestern Miller* (1938-39); *The Northwestern Miller & American Baker* (1939); *Cereal Chemistry* (1939); *Chemical Abstracts* (1939); *U.S. Patent Gazette* (1939); *Journal of the American Chemical Society* (1939). (H. E. BA.)

Fluorspar. The chief producers of fluorspar are the United States (35%), Germany (28%), the Soviet Union (14%), and the United Kingdom (8%); France was formerly an important producer, but has declined, while the Soviet Union has increased its output. The world total is now approaching 500,000 metric tons.

The United States imports enough to bring the domestic consumption up to about one-half of the world supply. The iron and steel industry in 1938 took 70% of the domestic consumption, glass and enamel, 13%, and hydrofluoric acid and its derivatives 16%; other uses are small. Of the imported spar, 52% was used for steel and 48% for hydrofluoric acid. (G. A. Ro.)

Fokker, Anthony Herman Gerard (1890-1939), Dutch aeroplane designer and manufacturer, was born April 6 at Kediri, Java, and died December 23 at New York city.

Football. During the past few years football has staged a steady recovery, and directors of athletic set-ups, with their large overhead and interest and amortization obligations on stadia, are breathing more easily. This uptrend continued in 1939, particularly in the South, which led in attendance gains and in the number of strong teams. Notre Dame attracted close to 500,000 people to its nine games. The record crowd of the year, 103,000, saw Southern California play the University of California of Los Angeles (U.C.L.A.). Army and Navy met before 102,000 in Philadelphia, with a heavy fog blanketing the field.

The foremost teams of the season, as ranked in a nation-wide poll of sports writers, were Texas A. & M., Tennessee, Southern California, Cornell and Tulane. All five were unbeaten, though Tulane was tied once and Southern California, twice. Tennessee, like Duke in 1938, went through its schedule without being scored upon and extended its winning streak to 23 games since 1937. The last 15 of them were all won by shut-out scores.

Southern California was again named to represent the Pacific coast in the Rose Bowl at Pasadena and invited Tennessee as its opponent. Led by Ambrose Schindler, the Trojans penetrated the Volunteers' defence twice to win, 14-0, and end the Southerners' long stretch of unblemished supremacy. Southern California had too much power for Tennessee, whose attack was weakened by the poor condition of George Cafego's knee.

Texas A. & M. and Tulane met in the Sugar Bowl at New Orleans. The tremendously powerful running of John Kimbrough from his full-back position enabled the Aggies to gain a 14-13 decision.

Cornell, which had its biggest season since 1923, scored one of 1939's notable victories in defeating Ohio State at Columbus. The triumph was hailed as the most signal blow struck for Eastern

football in a long time. The Ithacans declined all offers for post-season games.

In the other Bowl contests, Georgia Tech, with one of the trickiest attacks of the season, defeated Missouri, 21-7, in the Orange Bowl at Miami; Clemson and the renowned Banks McFadden overcame Boston college in the Cotton Bowl at Dallas, 6-3, and Catholic university played to a scoreless draw with Tempe (Ariz.) State Teachers in the Sun Bowl at El Paso. The West defeated the East in the All-Star game at San Francisco, 28 to 11, and the South won from the North in the Blue-Gray game at Montgomery, Ala., 33-20.

Sectional honours went as follows: Cornell was rated the No. 1 team of the East, followed by Boston college, unbeaten Duquesne, Fordham, Princeton, the champion of the Big Three; Villanova, unbeaten Georgetown, Penn State and Holy Cross. Pittsburgh, coached no longer by Dr. Jock Sutherland, and Carnegie Tech, Eastern leader in 1938, were not up to standard.

The Big Ten championship was won by Ohio State, although it lost to Michigan, whose defeat by Illinois was the most stunning reversal of the year. Iowa failed by a point to tie for the title. The Hawkeyes were the surprise of the year under their new coach, Dr. Eddie Anderson, who brought them up from the bottom of the conference to lose only one game and to defeat Notre Dame and Minnesota among others. Dr. Anderson was voted the "coach of the year" and Nile Kinnick of Iowa was awarded the Heisman Trophy as the "player of the year," his leading rivals being Tom Harmon of Michigan, Paul Christman of Missouri and George Cafego of Tennessee. At the close of a most disastrous year, Chicago withdrew from Big Ten competition. Missouri won the Big Six title, and other strong teams in the Middle West were Notre Dame, Michigan, Nebraska, Oklahoma, Minnesota, Purdue and Northwestern. Southern California carried off the Pacific Coast championship, barely holding off U.C.L.A. in the final game to gain a scoreless tie. U.C.L.A. was unbeaten, but tied four times; Santa Clara and Oregon State were the other outstanding teams on the Pacific coast.

Texas A. & M. was the champion of the South-west, in which the quality of the other teams was not up to the usual high standard. Southern Methodist, Baylor and Texas were next best after the Aggies. The race for the South-eastern honours ended in a triple tie among Tennessee, Tulane and Georgia Tech, while Duke and Clemson shared the Southern Conference title. Other strong teams in the South were North Carolina, Alabama, Auburn, Kentucky and Louisiana State.

Tulane was almost entirely a power team and used the pass sparingly. Tennessee was more of a running team than a passing team, and the same was true of Southern California, to a less extent. Texas A. & M. gave much less emphasis to the pass than the successful teams of the South-west have given in recent years. Cornell was one of the most brilliant passing teams of 1939, as well as one of the most efficient in its defence against the pass.

Professional football enjoyed its best season in the 18 years' history of the National Football League. The largest professional crowd since 1925 saw the New York Giants defeat the Washington Redskins in New York to win the Eastern Division championship. In the play-off with the Green Bay Packers, champions of the Western Division, the Giants were overwhelmingly defeated at Milwaukee and relieved of the national title.

Canada.—The Winnipeg Blue Bombers, led brilliantly by the shifty-running Fritz Hanson and boasting an unusually strong line, defeated the Ottawa Rough-Riders in the Grey Cup final for the title, 8-7. The blocking and tackling of the Bombers was acclaimed as the best seen in the East. Ottawa qualified as the representative of the East by first defeating the Toronto Argonauts for the Big Four title and then conquering the Sarnia Imperials, On-

tario Rugby Football Union champions. The Bombers defeated the Calgary Bronks for the Western Interprovincial title to qualify as the representative of the West. Western Ontario won the intercollegiate championship. (A. Da.)

Great Britain.—There was nothing outstanding in the 1938-39 Rugby season unless it was that after a brilliant record the previous year, Scotland occupied the bottom position in the international championship table. They were beaten by all the other countries, who each won a couple of matches, thus being bracketed as the top. The best matches in the series were undoubtedly those between England and Ireland at Twickenham, and between England and Scotland at Murrayfield. The first was a sheer joy to watch, Rugby football at its cleanest and best. At Murrayfield, England won back the Calcutta Cup from Scotland, but only because the Lancashire captain, J. Heaton, kicked 3 superb penalty goals, which was all England could score against 2 tries. There were no really promising players, suggesting high class, though R. S. L. Carr (England), M. J. Davies (Wales) and D. O'Loughlin (Ireland) were very good. Of the older players, F. J. Morgan (Ireland), T. F. Huskisson (England) and S. Williams (Wales) played splendidly again.

Warwickshire won the County championship for the first time in their history, whilst St. Mary's won the Hospitals Cup for the sixth year in succession, with probably the best club side in London. A cheery dinner in London celebrated the jubilee of the famous Barbarians Club, and amongst those who responded for the club was A. Allport, one of the Old Originals.

The Royal Navy won the inter-services tournament, though had the Royal Air Force begun as well as they finished, under the brilliant leadership of G. A. Walker, the championship would have been theirs, and easily.

One of the greatest players of all time, Gwyn Nicholls, the Welsh centre three-quarter, died towards the end of the season.

Rugby League.—Halifax met Salford at Wembley in the Challenge Cup final, before a record crowd, and a better match can hardly be imagined. Salford were badly, though unexpectedly, beaten by 20 points to 3. But when the Rugby League final was played the following week at Manchester, Salford had some compensation, for they beat Castleford (who had previously beaten Halifax by 21 points to 4) by 8 points to 6. Allan Edwards played superbly as the left wing for Salford. Salford, for all their magnificent history, had never won the Rugby League final before.

It was a great disappointment to followers of both Codes that the war came, for the Australians were due in England (and actually arrived) to play under the Rugby Union Laws, and the New Zealanders to play under the Rugby League Laws.

Association Football.—No club was more in the public eye than Wolverhampton Wanderers, and there was a time when they looked more than likely to win both the F.A. Cup and the League championship. In the end they lost both, being the runners-up in each case. Portsmouth beat them at Wembley in the Cup final, and beat them well by 4 goals to 1. But only the most ardent of the Portsmouth supporters ever dreamed of such a result. For once, youth did not have it all its own way, though nerves had a good deal to do with the defeat as well. Perhaps this "youth" idea was carried too far in 1939, for many of our leading clubs were playing youngsters well under 20 years of age, and in the end had to pay for it.

Everton were four points ahead of the "Wolves" in the championship table. The clubs to be relegated were Birmingham and Leicester City, and two famous old clubs, Blackburn Rovers and Sheffield United, came up from the Second Division to take their places. The Rangers won the Scottish League championship once more, and Belfast Celtic did the same to the Irish League. Ireland finished at the bottom of the championship table, the

other three countries registering a couple of wins each. For the always attractive match between England and Scotland, at Hampden Park, Glasgow, there was an amazing crowd of 150,000. England won it by 2 goals to 1, Lawton (Everton) and Beasley (Huddersfield) scoring for England, and Dougal (Preston North End) for Scotland. In the amateur world, England won the championship very easily, Moor Green the A.F.A. Cup and Bishop Auckland the F.A. Amateur Cup. The Earl of Athlone has accepted the office of president of the Football Association. (D. R. G.)

Ford, Ford Madox (1873-1939), British author, was born Ford Madox Hueffer in Merton, England, the son of a German who was music critic of *The Times* of London. He was related by marriage to William Rossetti, a founder of the pre-Raphaelite brotherhood. He professed to despise the group's art, and his early work was influenced instead by frequent travels in Germany and by a profound admiration for French culture. He began to write at an early age and had his first book, *The Brown Owl*, published in 1890. His first volume of poetry, *Poems for Pictures*, appeared seven years later. In the meantime he had published a biography of Madox Brown, his grandfather, and had written several novels. Though Ford unquestionably enriched contemporary English letters, literature may owe its greatest debt to him as the man who helped Joseph Conrad master English, and as the critic who first recognized the abilities of D. H. Lawrence, H. M. Tomlinson, James Joyce, T. S. Eliot, and others. He collaborated with Conrad in *The Inheritors* (1901) and *Romance* (1903). As editor of *The London Review*, which he founded in 1900, he made a practice of publishing the work of unknown authors. His *Transatlantic Review*, published in Paris after the World War, was the first journal to direct public attention to the stories of Ernest Hemingway, who was one of the group known as "Ford's boys."

Ford published more than 60 books in all, the most celebrated of which are *Some Do Not* (1924), *No More Parades* (1925) and *A Man Could Stand Up* (1926)—a series about England and the World War. In 1938 he finished his monumental *March of Literature*. He died at Deauville, France, on June 26.

Foreign Exchange: see EXCHANGE RATES.

Foreign Investments in the United States.

Total foreign long-term investments in the United States rose by \$420,000,000 during 1938, that is, from \$5,270,000,000 at the end of 1937 to \$5,690,000,000 at the end of 1938. Holdings of United States common stocks increased by \$400,000,000 of the \$420,000,000, largely as a result of the higher level of market prices that prevailed at the end of 1938. Another factor in the increase was an inflow of \$64,000,000 of foreign funds for investments in American securities. As a consequence, common stocks comprised 39.5% of the total foreign long-term investments in the United States as of the close of 1938 compared with 35.1% a year earlier.

Net purchases of United States securities by foreigners have been an important part of the large inflow of foreign funds since

TWO GIRLS' FOOTBALL TEAMS clashed in Oct. 1939 before 3,000 spectators in Los Angeles

early in 1934. Those net purchases have at various times been stimulated primarily by the chances of sharing in the benefits of advancing prosperity in the United States and at other times by the desire to escape the periodic political crises and threats of war which have plagued Europe. The effect of this inflow of foreign funds is evident in the estimates of the investments and, more particularly, in the higher percentage of outstanding shares that are held by foreigners—2.72% in 1934 and 4.41% in 1938.

Foreign Investments in the United States by Types of Investments,
1934, 1936 and 1938
(Year-end data: in millions of dollars)

Types of Investments	1934	1936	1938
Long-Term Investments:			
Direct investments (book value) . . .	1,518	1,640	1,685
Common stocks (market value) . . .	1,202	2,700	2,250
Preferred stocks (par value)	351	455	425
Bonds (par value)	536	563	580
Other investments (various values) . .	750	750	750
Total	4,357	6,108	5,690
Short-Term Investments:			
Total	614	1,620	2,193
Grand total	4,971	7,728	7,883

Source: Long-term data from Finance Division, Department of Commerce, Economic Series, No. 5, *The Balance of International Payments of the United States in 1938*. Short-term data from *Bulletin of the Treasury Department*, as adjusted in *The Balance of International Payments of the United States in 1938*.

As of the end of 1934, Canada, the United Kingdom and France accounted for 58% of the total foreign long-term investments in the United States. By the end of 1938, the share of these countries had declined to 56%, although in value their investments had risen to \$3,200,000,000. German investments were insignificant by comparison. Netherlands and Switzerland, on the other hand, increased their holdings from 24% to 27% of the total, or from \$1,061,000,000 to \$1,550,000,000.

During the first nine months of 1939, sales of United States securities by foreigners exceeded purchases by \$46,000,000. The principal sales were for the account of the United Kingdom. Some sales may have been induced by the anticipation of lower stock prices at the outbreak of the war. Contrary to what happened in 1914, however, the stock market experienced a substantial rise after the opening of the war in September, part of which was later lost.

Foreign short-term investments in the United States amounted, at the end of 1938, to \$2,193,000,000 compared with \$1,920,000,000 (revised) at the end of 1937. A large proportion of these foreign funds—88%—were in the most liquid form, that is, deposits in American banks. Furthermore, less than 5% of the foreign short-term investments were payable in foreign currencies. The

United Kingdom had the largest volume of funds in the United States. After a 67% increase during the 12 months of 1938, British short-term investments amounted to \$446,000,000. Canada was second with \$239,000,000, followed by Switzerland, \$224,000,000; France, \$196,000,000; and Netherlands, \$102,000,000. German dollar assets of this character were very small, amounting after several years of withdrawals to \$20,000,000. During the first nine months of 1939, foreign banking and brokerage funds in the United States increased greatly as a result of an almost continuous inflow from January through September, which aggregated \$1,159,000,000. Approximately one-half of this inflow was for the account of the United Kingdom, France and Canada, and just over one-third for neutral European countries.

BIBLIOGRAPHY.—"Foreign Investments in the United States," Government Printing Office (1937); "The Balance of International Payments of the United States in 1938," Department of Commerce, Finance Division; *Bulletin of the Treasury Department* (monthly), Office of the Secretary, Treasury Department; Cleona Lewis, *America's Stake in International Investments*, Brookings Institution (1938). (P. D. D.)

Foreign Missions. Four developments during 1939 affected the course of Protestant missions from the United States. First was the continuation of the hostilities between China and Japan. This proved both a handicap and an aid. It was a handicap, because the tightening Japanese cordon on the coast made access to the interior more difficult, Japanese bombings injured some mission property and added to the load carried by mission hospitals, and Japanese occupation brought various annoyances to missionaries. It was of assistance, because the relief given to the suffering and the general disorganization of society made the Chinese more receptive to the Christian message. In Japan and Korea (Chosen) the churches increasingly felt the pressure of the Government, intent as it was upon promoting national solidarity in the face of the war. A second development was the outbreak of the European war. By embarrassing German missions, especially in British colonial possessions and in India, and by jeopardizing the incomes of British societies, it placed heavier burdens upon American societies. The burden of the Protestant foreign missionary enterprise was forced more than before upon the churches of the United States. A third development was the effect of the meeting of the International Missionary Council held at Tambaram (Madras) in Dec. 1938. On their return, delegates to the conference, including international teams, spoke widely of the findings of the gathering. The effect was to hearten missionary forces, to give an added sense of the world-wide extent of Christianity, and to bring important modifications in missionary policy. The fourth development was financial. The incomes of the mission boards remained about the same as the preceding year and in some instances registered a slight increase.

Roman Catholic missions from the United States felt the impact of both the Far Eastern and the European war. Since Roman Catholic missions from the United States are so largely concentrated in the Far East, notably in China, Manchoukuo, and Korea, they were especially affected by the Sino-Japanese conflict. Reinforcements continued to be sent, extensive relief was given, and large numbers of baptisms were reported. (K. S. L.)

Forests. When armies march as dictators command, America must strengthen internal as well as external defenses. Besides building warships the U.S. must stop heedless abuse of land, water, and forests, for they are sources of raw materials and other necessities of life, and of employment and income. Besides constructing aeroplanes, these resources must be built up and kept continuously and fully productive.

With muskets beside them, early pioneers chopped down white pine and tulip trees four feet and more in diameter, rolled most

of the logs into piles, and burned them. By crop-planting time the clearings afforded a measure of protection from Indians. Then a young and eager nation expanded westward, and these processes were repeated. Now there are no hostile Indians. Forests no longer occupy good agricultural land to any extent. The need for wholesale forest clearing for settlement and cultivation no longer exists. But merchantable standing timber has been reduced by one thousand billion board feet since 1910. Forests were abused in this process, as in earlier ones. And they are still being abused.

Woods practices responsible for ghost towns are not practised on the national forests, which are administered by the Forest Service of the U.S. Department of Agriculture. In 1939, 1,290,581,000ft. of timber were harvested from them under regulations that promise succeeding crops; forage was used, under permits, by more than 6,500,000 domestic stock; sources of water for towns, cities, industries, and agriculture were protected; more than 32,750,000 visits were made by people who enjoyed wildlife and recreational opportunities and facilities.

There are nearly 176,000,000ac. of public land in the national forests. They are valuable, but the best three-fourths of all forest land that bears commercially valuable timber is privately owned. It furnishes more than 95% of the timber cut, and is subject to most of the forest drain. It also renders public services that are worth more to 130,000,000 of people than are the values it has to the fewer people who own it. Privately owned forests are therefore a major factor in the nation's forest situation. So are problems facing private owners.

There are many such problems. A basic one is that, in most regions as in the country as a whole, mill capacities are so far above the power of accessible land to produce usable forests that the time many operations may continue at present levels is limited. Another is the need to operate at a profit. It costs money to grow enough timber in time to keep operations going. This has never been done by most private owners. Instead, most profits have come from liquidation. Other problems include forest taxation, tax delinquency, and insurance, credits at low interest, and freight rates.

One important problem is to protect forests from fire, insects, and diseases. Another is to extend markets. This emphasizes the paradoxical situation of the tremendous need for new building and repairs for example, on the one hand, while forest industry plants are operating at only about half their mechanical capacities.

Approximately 202,000,000ac. of commercial forest land are in industrial and nonfarm ownership. Farmers, who own 139,000,000ac., have the same problems most industrial owners do, but there is a group of problems that because of certain conditions become of particular importance to farm forest owners. One is that forest ownership is more widely distributed among farmers, and that individual ownership is generally in smaller tracts. Pressure to cut farm forests for cash to buy food and clothing is greater, and this sacrifices values and throws unripe timber on the market more often. Most farmers grade, price and manufacture forest products less effectively than larger industrial forest owners; and it is also more difficult for the small owner to locate and keep profitable markets.

Despite progress in solving many of these problems, neither public nor private forest policy, nor private nor public action programs, are adequate to meet present or future conditions.

Briefly, basic requirements for an adequate Federal forest policy are:

First: That although the forest policy may be stated in terms of land use and of trees and industries, its fundamental purpose must be to assure social and economic security for dependent people and communities.

Second: That since it helps control floods, prevent erosion, and protect

cultivated lands and crops, all forest land must be adequately protected.

Third: That operations on commercial forest land, irrespective of ownership, shall be so conducted that (a) the land will promptly be put into new production of commercially usable timber, and (b) it will be kept in this condition.

Fourth: That output of forest industries shall be so related to present supplies of accessible and usable timber, and to the power of forest lands to produce it, that continuous use of that timber by dependent industries and communities and people shall be possible.

This is the policy that guides the Federal Forest Service in its administration of the national forests and in redeeming those responsibilities that, entrusted to it by Congress, have to do with forest lands in private ownership. It is a policy that aims to prevent disastrous hushes, even though it may level out short-lived hooms; that aims at social and economic security for labour and industry, alike.

An adequate forest action program should include (1) public co-operation with private owners of forest land, (2) public regulation of cutting practices on privately owned forest land, and (3) extension of public ownership and management of forest land.

This action program embodies principles all of which have already been recognized, at least in part, by Federal or State legislation or both. To some extent each essential part of the program has also been recognized by many private owners and forest industries, and has been and is being translated by some of them into action in the woods. Agreement is general on the need for more public co-operation with industrial as well as farm owners of forest lands. But most forest industries prefer self-regulation, as railroads and public utilities once did. A measure of regulation by industry of its own cutting practices on forest lands has been practiced for some time in the Pacific Northwest, for example; a region that has most of the remaining virgin timber, and one-third of all U.S. saw timber. Yet many mills in the vicinity of Grays Harbor, Puget Sound, and the Lower Columbia basin are already facing curtailment. Many dependent families and communities there are threatened. In the Northwest as a whole indications already point to a gap of a generation or more between the end of the usable old growth and the time when enough usable second growth will be ready for cutting.

Despite self-regulation in the Pacific Northwest, 70% of its privately owned commercial forest land is not yet under adequate forest management. Nearly 55% of it probably will not restock without costly artificial planting. And although State and Federal aid have been given, and progress has been made in fire protection, the majority of woods operations on private forest lands in the Pacific Northwest—and in most other major forest regions—are still on a liquidation basis. This nullifies much of the public co-operation and aid that have been extended to private owners over the years.

Public co-operation and aid are essential to private owners of forest land, but experiences in the Pacific Northwest—and elsewhere—seem to indicate that public regulation, and reasonable extension of public ownership and management, afford the only effective assurance that forest industries will respond effectively to such aid. (E. H. CL.)

British Empire.—One of the outstanding events in British Empire forestry during 1939 was the disaster caused by bush fire in Australia, especially in the State of Victoria, in January. Many lives were lost and damage valued at several million pounds resulted. A Royal Commission was appointed to inquire into the causes of these fires and make recommendations for future safeguards.

Reforestation continues to make steady progress especially in Great Britain and South Africa. In New Zealand the rate of reforestation is being reduced and more attention is being paid to management of the native forests. In Canada the importance of sustained yield forestry is being more and more appreciated and

there, as in the United Kingdom, the necessity for some greater regulation of the management of private forests is becoming more apparent. During the year the Forestry Commission of Great Britain held further conferences on the subject of private forestry. The outbreak of the war and the necessity for increasing home grown supplies further emphasized the necessity for some form of state control over this class of forest. In India and Burma the new governments under the India and Burma Acts, while fully realizing the value and importance of their forests, find that the call for funds for "nation building" departments necessitates a reduction of staff and expenditure on forests, a policy that may have serious effects on the value and future revenue of the forests. Progress is being made by colonial forest departments especially in the important aspect of land planning and soil conservation which is being tackled in co-operation with the agricultural and veterinary departments. Soil conservation and the protection of water supplies is becoming one of the most important branches of protective forestry.

Until the start of the European war, timber markets were recovering from the setback of 1938 and the Empire imports of timber, especially from British Columbia, to the British Isles were on the increase. Since the start of the war there has been a still further increase of activity in British Columbia in order to fill the gap in timber imports caused by the loss of the Baltic trade. (See also LUMBER.) (H. R. BD.)

Formosa (TAIWAN), a large island in the Western Pacific, between the East and South China seas, bisected by the Tropic of Cancer; area 13,429 sq.mi.; capital, Taihoku; population (1936) 5,451,863, mainly Chinese. Formosa has been part of the Japanese Empire since 1895, when it was conquered from China. Part of the island was under Dutch rule from 1624 until 1662; and remains of forts and other Dutch buildings are still to be found in the southern part of the island, in the vicinity of Tainan. Formosa is governed by a governor-general, assisted by an advisory Council, the majority of the members of which are Japanese. The present governor-general is Admiral Seizo Kobayashi. An important Japanese naval base, access to which is closely restricted, is at Mako, in the Pescadores, islands off the western coast of Formosa. The importance of the island as an aeroplane and naval base has been demonstrated during the hostilities with China. Formosa is, in proportion to its size, perhaps the richest of Japan's colonies. It has been intensively exploited, Japanese investment in the island being estimated at 400,000,000 yen (\$200,000,000 at pre-devaluation rates of exchange). Most of this capital has been invested in the sugar industry. Exports from Formosa in 1936 amounted to 387,948,978 yen and imports to 292,685,948 yen. Gold has been discovered in the island, production in 1936 reaching a value of 4,223,712 yen. As the agricultural possibilities of the island have been largely developed there has been a tendency to establish industries, among which the chemical and spinning are the most prominent, and also to utilize the island's considerable resources in hydro-electric power. (W. H. CH.)

Forster, Albert (1902—), German politician, was born August 27, in Fuerth, Bavaria. His training was for commerce, but after two years of apprenticeship in a bank he was dismissed for membership in the Nazi party. He was then a local Nazi group leader at Fuerth for five years. Moving to Danzig, he became *Gauleiter* (district leader) of that city in Oct. 1930. In that year also he was elected to the Reichstag. In April 1933 he was appointed leader of the Organization of German Employees in Danzig, and four months later a Prussian State councillor. He also edited the newspaper *Deutscher Vor-*

posten. Forster came into international prominence in 1939 during the disputes over the Free City. On August 10, after a visit with Hitler, he declared the imminence of Danzig's return to the Reich. On August 24 he was elected head of the government of Danzig to replace Arthur Greiser. On September 1, the day Germany invaded Poland, he proclaimed in a letter to Hitler the formal reunion of Danzig with Germany. Then, like Seyss-Inquart after the Austrian *anschluss*, and Henlein after the pact of Munich, Forster sank into relative oblivion for the rest of 1939, except to introduce Hitler when the latter made a speech at Danzig September 19.

France, area, 212,736 sq.mi.; population (est. June 1938) 41,980,000. Chief towns (pop. 1936): Paris, 2,829,746; Marseilles, 914,000; Lyons, 571,000; Bordeaux, 258,000; Nice, 242,000; Toulouse, 213,000; Lille, 201,000; Nantes, 195,000. President, Albert Lebrun. Language, French; religion, Roman Catholic; c. 1,000,000 Protestant. (X.)

History.—Confronted since Nov. 1938 by Italy's noisy though unofficial demands for Tunisia, Jibuti, and other French possessions, Daladier replied with a triumphal tour through Corsica and North Africa (January 2-6) and a stout proclamation to the chamber on January 26 that France would maintain the integrity of her empire and the security of the imperial routes. No time was lost in re-enforcing the defences in North Africa and in seeking still closer relations with Great Britain, made public by Foreign Minister Bonnet's announcement of January 26 that, in the event of war, all forces of Great Britain would be placed at the disposal of France and reciprocally those of France at the disposal of Britain. The two powers again acted in concert in recognizing General Franco's Government on February 27. Socialist and Communist deputies greeted with bitter opposition this new "appeasement to dictator nations"; but Daladier maintained that he wished to relieve France of the necessity of defending a third frontier 450mi. long. These differences in no way impeded the rearming which went on apace throughout the spring. On January 31 the chamber voted to prolong the two-year military service law. The economic and fiscal policies initiated by Reynaud in November had rapidly borne fruit: interest rates had declined, a result of growing confidence among businessmen; savings banks deposits had risen sharply; and unemployment was on the wane. Optimism was being generated anew through this industrial revival, when Hitler's proclamation of a protectorate over Bohemia and Moravia (March 15) and his extension of "protection" to Slovakia (March 16) shocked France and galvanized the country into redoubled activity. On March 18, Robert Coulondre, ambassador to Germany, was recalled for consultation, and, with Great Britain, the French Government issued a formal protest against Hitler's conquest, marking the end of "appeasement." Of greater import was Daladier's action of March 17, when he summoned parliament to grant him *plein pouvoir*—full power—to rule France by decree in all matters affecting national defence until November 30. In the acrimonious chamber debate ensuing, Daladier admitted that the decree might involve a temporary suspension of individual liberties, but adamantly refused to change its provisions. On March 18 the chamber passed the bill 321 to 264; next day it became law by a senate vote of 286 to 17.

Daladier quickly put to use the extensive powers thus granted him, and on March 20 he promulgated 16 decrees. The first four dealt with military defence, empowering the Government to extend

the service periods of those already with the army and to call specialists to the colours without a preliminary voting of credits by parliament, permitting the formation of new regiments, prohibiting the unofficial publication of military information, and reorganizing the Sixth military region, of which Metz is the centre. Nine decrees were intended to speed production in armaments and all supplies necessary for national defence: in such industries the maximum work week was increased to 60 hours; overtime, for which rates of pay were scaled down, could be exacted by the employer; Government control was established over all local employment agencies, and specialists could be required, under heavy penalty, to take jobs in distant factories. Three further measures proposed by Reynaud included appointment of a comptroller for Marseilles to carry out "municipal reform" in that city, elimination of several autonomous Government bureaus, and suspension of employment of new State functionaries for 1940.

On the closing day of the month, announcement was made of the decision of the British and French Governments to aid Poland in resisting any threat to her liberties. To offset German trade advances in the Balkans, commercial treaties were concluded on the same day with Poland, Rumania, and Yugoslavia, opening French markets to products of these countries.

A factor in the unification of France was the "draft Lebrun" movement which got under way shortly before the presidential election. With Lebrun at the helm, an internal political battle would be averted, and Daladier might pursue unmolested the course upon which he had embarked. Favoured candidates patriotically withdrew in the president's favour, and he was re-elected on April 5, polling 506 votes to 398 for all his opponents.

As the Italians precipitated a new crisis by overrunning Albania (April 7), Great Britain and France hastily guaranteed Greece and Rumania aid against any attack which they themselves undertook to resist (April 13). And a new batch of laws issued April 21 placed France definitely on a war footing. State control of the labour force was extended: the 45-br. week was widely adopted, with remuneration for overtime at a rate only 5% higher than the normal pay. New fiscal measures were introduced to pay for armaments, whose manufacture had by now almost entirely supplanted public works; municipal finances and administration were reformed with a view to economy; limits were placed on the price-guaranty for grain; superfluous civil servants, when not transferred to other Government departments or to private concerns, were to be retired; a progressive tax was placed on the profits of munitions firms; strict scrutiny of incomes was established for taxation purposes; and, lastly, a sales tax of 1% was levied.

FRANCE: Production and wholesale prices (*The Annalist*)

Replying to Hitler's blistering speech of April 28 on his differences with Poland, Daladier expressed to the chamber on May 11 the determination of France to defend herself against aggression through military measures, and to act jointly with Britain in safeguarding the independence of Central and Eastern Europe. This statement drew unanimous support from the chamber, although the next day there was a division over its practical interpretation, the Socialists voting against Daladier because of Reynaud's methods, which, they maintained, thrust upon the poor the chief burden of preparedness, and were prejudicial to labour's interests.

Reynaud, nothing daunted by these criticisms, continued to renovate the fiscal and economic structure of the nation. On May 15 the Treasury floated a bond issue of 6,000,000,000fr. at 98, maturing in 40 years, and paying 5% interest, which was fully subscribed within 24 hours. France's industrial comeback since the fall of 1938 had been truly impressive. Since October, 27,000,000,000fr. in gold had been repatriated, and the reserves of the Bank of France had risen to 14,700,000,000, francs. The business index, which had been 82 in 1938 (100=1928), had climbed to 92 in March 1939, and 97 in May.

On June 6, the control of the entire war machine was entrusted to General Maurice Gustave Gâmelin, named by decree commander-in-chief of France's defence forces (land, sea and air). To bolster French defences in the Near East and hinder a potential German *Drang nach Sud-osten*, a joint Franco-Turkish declaration of mutual assistance was signed June 23; a separate treaty returned to Turkey the Hatay Republic in the Levant, long under dispute between the two countries (the joint declaration was amplified by the tripartite treaty of October 21). On July 1 France notified Germany that no unilateral change in Danzig's status would be tolerated, but angry mutterings across the Rhine augured ill for any satisfactory settlement of the issue. In response to Soviet proposals for a united peace front against Fascism, conversations were carried on in Moscow, supplemented by consultations among the military staffs of Great Britain, France and Russia. A deadlock, however, was early reached which apparently concerned, among other things, the entrance of Russian troops into Poland, Russia arguing that only by sending troops could she meet the enemy on a common front, and Poland adopting a "timeo Danaos" attitude.

The tension created by Hitler's fist-shaking and the apparent failure of the Moscow talks was heightened by events at home. On June 16, the submarine "Phenix" sank off the coast of Indo-China, giving rise to rumours of sabotage which increased the general irritability of spirits. On June 27, when parliament was closed by a brief presidential decree approved in the chamber by a vote of 350 to 231, the premier made a grim and enigmatic reference to espionage in France, giving currency to frightened rumours of a Fascist Fifth Column. The story was later unfolded: French agents had apparently been guilty of collusion with Otto Abetz, head of German propaganda in France, who had recently been invited to leave the country. On July 29, the cabinet approved decrees aiming to counteract the declining birth rate: 9,000,000,000fr. were provided in bonuses and credits to large families, severe penalties for abortion were instituted, adoption was simplified, and childless married couples and bachelors were taxed. A rigorous spy code, approved at this time and issued August 1, provided the death penalty for 10 crimes and offences against the security of the State, including unauthorized publication of military information or information on counter-espionage; persons accused of such crimes were to come before military courts.

On July 29 also the cabinet assented to Daladier's momentous decision to suspend the national elections scheduled for 1940, prolonging the life of parliament for two years. Socialist and

other parties of the Left declared the move unconstitutional; but their attempts to whip up indignation in the country failed, for France's attention was riveted on the international scene.

Throughout August, conversations in Moscow were pursued, while Hitler pressed Poland steadily harder. France and England were determined that this time they would not be caught napping. Nevertheless the news of a Russo-German commercial treaty (August 19) came as a bitter surprise. Thenceforward catastrophic events followed one another in headlong succession. On August 21, France, in reply to the impending Soviet-German non-aggression treaty, mobilized reservists and reaffirmed her pledge to Poland. On August 24, the cabinet met to consider Hitler's refusal of the British suggestion for a truce; ominous warnings were issued to evacuate Paris. On the same day the terms of the 10-year German-Soviet pact were disclosed, causing havoc among French Communists. Many hastily repudiated the party; others justified the pact with the argument that Stalin had subtly thrown a wrench into the Axis machinery, and published a proclamation of their loyalty to France. This declaration of goodwill did not save them; the publication of *Humanité* and *Ce Soir* was suspended by a decree of August 26, and Communist headquarters in Paris and provincial cities were raided.

August 26 the French and British military missions left Moscow, and on Sunday night, August 27, the French Government published an account of the correspondence of the previous day. Daladier had sent the German Fuehrer a note, suggesting the direct negotiation between Warsaw and Berlin and asking him not to "spill the blood of two great peoples who long only for peace and work." Hitler, trying to separate France from her ally, had responded that Danzig and the Polish Corridor must be returned to the Reich, but that he had no quarrel with France and wanted only to keep the peace with her. Uninfluenced by these soft phrases, the French Government on August 28 closed the frontier with Germany, established a co-ordinated censorship of all means of communication, under Jean Giraudoux, and took steps to evacuate the population from military zones. On August 30, thousands of children were removed from Paris, and the railroads were turned over to the army.

At dawn of September 1, the German attack on Poland began. France and Great Britain demanded, in a joint note presented to the German Government by the French and British ambassadors, the cessation of aggressive action by Germany and the withdrawal of her troops before any negotiations could be undertaken; failure to comply would be met by fulfilment of allied obligations to Poland. General mobilization was decreed for September 2, and parliament, convoked for 3 P.M. that day, adopted a war budget bill of 69,000,000,000fr., indicating support of the premier in any steps he chose to take. The time limit for the expiration of the last warning to Germany was fixed for 5 P.M., Sunday, September 3. When it was clear that no response from Hitler was forthcoming, France was automatically at war (*see EUROPEAN WAR*), but inclement weather and the strength of the opposing fortifications produced a stalemate in the west for the remainder of the year. Although Paris and other large cities had taken air-raid precautions, as the fall wore on "black-outs" were lightened. Moreover, it was planned, beginning October 17, to demobilize older classes and reservists, releasing them for service in factories and on farms.

New decrees altered the economic life of the nation. On October 8 a provision of the National Wheat Office limiting wheat planting was suspended. A decree aimed at conserving France's food resources forbade the slaughter and sale of all meats on Monday and beef on Tuesday (October 17). By a decree of October 30, French workers were placed at the command of the Government in factories whose services were required for national de-

fence; such workers may be requisitioned and assigned to plants where they are most needed.

Economic co-ordination was facilitated by the appointment of D. Serruys as high commissioner of national economy on September 15, and by the creation, on November 10, of a new department in the Ministry of Marine, the Direction of Maritime Transport, in charge of the cargoes and crews of requisitioned vessels. Production of aeroplanes was speeded, and the lifting of the embargo in the United States (November 4) gave France an opportunity to purchase large numbers of planes. Of great moment was the economic accord reached by France and Great Britain at a meeting of the Supreme War Council on November 17. This agreement provided for co-ordinated purchase and distribution of munitions, war materials, oil, and food, and common control of shipping and economic warfare. The resources of both countries in raw materials, means of production, and tonnage were to be used in the common interest; competition in foreign purchases to be avoided; and limitations suffered by either country to be equally distributed. By the end of November a co-ordinating committee was established, with Jean Monnet, an Englishman of French antecedents, as chairman. Hitler's hope of driving a wedge between the two allies seemed less than ever capable of realization.

France used the respite afforded by a period of military inactivity to strengthen her diplomatic position. On October 6, Daladier, who had assumed the Ministry of Foreign Affairs on September 13 (Bonnet going to the Ministry of Justice), replied to Hitler's peace proposals in a speech to the senate foreign affairs committee: "We must go on with the war that has been imposed upon us until victory, which will alone permit the establishment in Europe of a regime of real justice and lasting peace." On October 19, after tergiversation on the part of Turkey, caught between two fires, that power was induced, by the promise of extensive credits, to sign a treaty of mutual assistance with France and England against aggression in the Mediterranean or the Balkans; Turkey would not, however, be expected to take action which would bring her into conflict with Russia.

On November 12, President Lebrun and King George VI stated the war aims of their peoples with a vagueness characterizing such statements to date: the King said the British would not lay down

arms until the bogey of recurrent German aggression had been banished; Lebrun spoke of the reparation of injustices imposed on Austria, Czecho-Slovakia, and Poland.

Internally, the French cabinet has been occupied with the quashing of dissentient opinion, in particular with anti-war propaganda. The Government's attention was concentrated mainly upon the Communists. The Party as such had been dissolved on September 26, but many of its members had formed a new group known as the Workers and Peasants Party, under whose auspices a letter was presented to Herriot, president of the chamber, on October 3, urging consideration of Hitler's peace offers. Tracked down by the military police, who charged that the new party was an illegal reconstitution of Communist groups, many Communist deputies were summoned before military tribunals and jailed. Likewise, members of the outlawed sect were systematically weeded out of municipal administrations.

On November 30, parliament convened to extend Daladier's decree powers for the duration of the war. A proposition was adopted that each decree should be submitted for legislative approval within one month, if parliament were in session.

On December 12, Great Britain and France reached a financial accord which was the logical outcome of the economic agreement of November 17. It provided that the currencies of the two nations should be stabilized at the rate of 176½fr. to the pound until six months after the signing of a peace treaty; also, that each country might pay in its own currency for goods purchased from the other, without touching its gold reserve. No foreign loans or credits were to be negotiated without prior agreement, and all loans granted to the allies were to be shared on a 60-40 basis, Great Britain receiving 60%. Finally, close contact was to be maintained on internal price policies. On December 19, the Allied Supreme War Council announced its decision to aid Finland morally and materially insofar as that was possible. As the year closed, the senate unanimously voted an 80,000,000,000fr. budget (December 28) and a credit of 259,000,000,000fr. for military expenses during 1940 (December 29). (D. C. McK.)

Education.—In 1938: Elementary: schools, 81,000; scholars, 4,900,000. Secondary: schools, 546; scholars, 270,000.

Banking and Finance.—In francs, revenue, ordinary (1937), 43,379,000,000; expenditure, ordinary (1937), 48,168,000,000;

DEAUVILLE, like all other French resorts, was barren of its gay crowds in the autumn of 1939, except for a lone American expatriate, Berry Wall

revenue, ordinary (1938), 54,264,000,000; expenditure, ordinary (1938), 63,840,000,000; expenditure, ordinary (est. 1939), 64,500,000,000; expenditure, extraordinary (est. 1939), 29,600,000,000; public debt, domestic (Aug. 31, 1939) 432,634,000,000; exchange rate (average 1938), 170.7fr.=£1 stg.; exchange rate (Dec. 8, 1939), 176.5fr.=£1 sterling. Notes in circulation (Nov. 30, 1939), 146,370,000,000fr., gold reserve (Nov. 30, 1939), 97,266,000,000 francs.

Trade and Communication.—Overseas trade, merchandise: imports (1938), 45,981,163,000fr.; exports (1938), 30,585,730,000fr.; imports (1939, 8mo.), 32,539,000,000fr.; exports (1939, 8mo.), 23,832,000,000 francs. Communications: roads: national 48,000mi.; secondary 330,000mi.; railways 26,300mi.; airways, 1938: mileage 6,392,000, passengers 99,855, mails carried 1,894,000lb.; freight carried 2,956,000lb.; shipping, gross tonnage (June 30, 1938) 2,903,600; shipping, net tonnage entered (monthly average 1938) 4,330,000; shipping, net tonnage entered (July 1939) 4,467,000; shipping, net tonnage cleared (monthly average 1938) 3,561,000; shipping, net tonnage cleared (July 1939) 2,769,000. Wireless receiving set licences (Dec. 31, 1937) 4,163,692; telephones (Jan. 1, 1938): 1,540,300 subscribers; motor vehicles licensed (Dec. 31, 1937): total vehicles 2,200,000, of which 558,000 are commercial vehicles.

Agriculture, Manufactures, and Mineral Production.—In 1938: in quintals, wheat, 101,479,000; barley, 12,908,000; rye, 8,111,000; oats, 54,574,000; maize, 5,786,000. Mineral production for 1938 (monthly average, metric tons): coal, 3,875,000; pig iron, 504,000; steel, 515,000. Wine (1937), 54,310,000 hectolitres. Industry (1929=100): index of industrial production (average 1938), 76; index of industrial production (June 1939), 92. Labour: index of employment (average 1938: 1929=100) 81; (June 1939: 1929=100), 82; unemployed in receipt of benefit (average 1938) 376,000; (average Sept. 1939) 317,000.

Priestley, *France Overseas* (1939); Walter Rice Sharp, *The Government of the French Republic* (1939); Joseph John Spengler, *France Faces Depopulation* (1939).

Franco, Francisco (1892–), Spanish soldier and head of the Spanish Government, was born in Galicia. After military service in Morocco, he became a colonel in 1926, and served under the Spanish republic of 1931 in the Balearic islands, being later transferred to Morocco again. In 1935, he was made chief of staff. Under the Lerroux-Robles Government he became governor of the Canary islands. On the outbreak of the civil war in June 1936, he flew to Tetuan, in Spanish Morocco, and there organized the transport of Foreign Legionaries and Moorish troops to the Spanish mainland, whither he soon followed. After the death of Gen. Sanjurjo, Gen. Franco became military leader of the insurgents, and on Oct. 1, 1936, was solemnly invested at Burgos with the titles of "Commander-in-Chief of the Spanish Army" and "Chief of the Spanish State."

After the end of the civil war on March 29, 1939, Franco demobilized his army and began the tremendous task of reconstruction. After several postponements and rumours that Italy wished to delay withdrawal of her troops from Spain, he held his "victory parade" in Madrid May 19. Franco first invited the voluntary assistance of all his subjects in rebuilding Spain, then conscripted such assistance on July 30, 1939, when he ordered that every able-bodied Spaniard should work for the state 15 days each year without pay. In August, by decree, he added the title of prime minister of Spain to the others he possessed, and swore

in his new cabinet at Burgos, which remained the capital of the country until Madrid was restored October 16. Franco showed no disposition to become involved in the European war, and on September 4 he issued a declaration of "strictest neutrality." Reputedly he was deeply chagrined over the Nazi-Soviet pact of non-aggression.

Frankfurter, Felix (1882–), American jurist, was born in Vienna on November 15 and emigrated with his family to the United States as a child in 1894. He graduated from the College of the City of New York in 1902 and was granted his degree of bachelor of laws with highest honours from Harvard four years later. After completing his legal education he became assistant to Henry L. Stimson, then United States attorney for the southern district of New York, in which position he enthusiastically joined the "trust-busting" campaign of Theodore Roosevelt and helped prosecute several large corporations. In 1911 he was appointed a law officer in the Bureau of Insular Affairs in Washington and remained there for three years until he was offered a professorship of administrative law at Harvard in 1914. Except for various leaves of absence he remained on Harvard's faculty thereafter. During the World War (1914–18) he was assistant to secretary of War Newton D. Baker, assistant also to the secretary of Labor, counsel for the President's Mediation commission, and chairman of the War Labor Policies board. At the Paris Peace conference in 1919 he represented the interests of the Jewish people. On Jan. 5, 1939 he was appointed associate justice of the Supreme court to succeed the late Benjamin N. Cardozo. Frankfurter is an eminent authority on criminal, administrative, and constitutional law and on the Supreme court; he is the author of many volumes and articles upon these and other legal subjects.

Franklin, Philip Albright Small (1871–1939), U.S. shipping executive, was born at Ashland, Md., on February 1. After an education in public and private schools he worked for a time in Paris, and upon his return to the United States he started his shipping career as an office boy for the Atlantic Transport company in Baltimore. Later he became traffic agent, manager, and general manager; and in 1902 he was made president of the line when it became affiliated with the International Mercantile Marine company. He was made vice-president of the latter organization in 1916 and as its president from 1921 until his retirement in 1938 he directed seven steamship lines before three of these (the White Star, Red Star, and Leyland lines) were sold. In 1918 he was chairman of the Shipping Control Committee, a joint creation of the U.S. War Department and the U.S. Shipping Board, and had control over some 1,200 vessels. For this service he was awarded the Distinguished Service Medal; he was also a chevalier of the Legion of Honour. He died at Locust Valley, L.I. on August 14.

Freemasonry: see MASONIC ORDER.

French Colonial Empire. Total area (approx.) 4,787,000 sq.mi.; total pop. (est. Dec. 31, 1937) 112,177,000. Certain essential statistics of the French colonies, protectorates, and mandates are given in the table on page 304.

History.—The 70,000,000 inhabitants of the French overseas possessions are not governed by a single administration. Algeria comes under the minister of the interior; the protectorates of Tunisia and of Morocco, and the mandated territory of Syria, under the minister for foreign affairs; the rest of the colonies and the mandated territories of Togo and the Cameroons under the min-

ister for the colonies. There are 3 colonial policies which do not necessarily coincide. In 1939 the policy pursued by the minister for the colonies, M. Mandel, appeared to be more active and more liberal than that of his colleagues at the other ministries.

North Africa.—The developments of the first eight months of 1939 were dominated by the prospect of war. Military preparations and economic planning took precedence over political and social reforms. German claims to her former colonies and Italian agitation over Tunisia and Jibuti stirred French public opinion, from indifference to colonial solidarity.

Anti-French propaganda was most active in North Africa, through broadcasts in Arabic from Bari, Berlin, and Seville, and through the agency of those Moroccan nationals, installed in Spanish Morocco, who supported the idea of a Tetuan-Cairo axis, modelled on the Rome-Berlin axis. Its success was slight.

French Colonial Empire

COUNTRY AND AREA sq. miles (approx.)	POPULATION ('000's omitted)	CAPITAL, STATUS, GOVERNORS, PREMIERS, ETC.
FRANCE, 212,736 . . .	41,970	Paris, republic, <i>President</i> : M. Albert Lebrun. <i>Premier</i> : M. Edouard Daladier.
ASIA		
FRENCH INDO-CHINA, 283,000	23,300	Saigon, <i>Governor-General</i> : General Catroux.
ANNAM, 55,800 . . .	5,056*	Hue, protectorate, <i>Resident-Superior</i> : M. Graf- feul.
CAMBODIA, 69,200 . .	3,046*	Pnom Penh, protectorate, <i>Resident-Superior</i> : M. Thibaudeau.
COCHIN-CHINA, 25,400	4,616*	Saigon, colony, <i>Governor</i> : M. Vcber.
LAOS, 88,800	1,012*	Vientiane, protectorate, <i>Resident-Superior</i> : M. Touzet.
TONGKING 43,800 . .	8,700*	Hanoi, protectorate, <i>Resident-Superior</i> : M. Châtel.
KWANGCHOW WAN, 310	250	Fort Bayard, territory (leased from China), <i>Administrator</i> : M. Le Prévot.
FRENCH INDIA, 190 . .	300	Pondicherry, colony, <i>Governor</i> : M. Bonvin.
SYRIA AND LEBANON, 77,700	3,600	Damascus, mandated territory, <i>High Commis- sioner</i> : M. Puaux.
AFRICA		
ALGERIA, 845,400 . . .	7,400	Algiers, colony, under jurisdiction of the Min- ister of the Interior, <i>Governor-General</i> : M. Le Beau.
MOROCCO (F.), 165,800	6,430	Rabat, protectorate, under the Minister of Foreign Affairs, <i>Sultan</i> : Sidi Mohammed. <i>Resident-General</i> : General Nogues.
TUNIS, 48,800	2,670	Tunis, protectorate, under the Minister of Foreign Affairs, <i>Beys</i> : Sidi Ahmed. <i>Resident- General</i> : M. Labonne.
FRENCH SOMALILAND, 8,380	50	Jibuti, colony, <i>Governor</i> : M. Deschamps.
MADAGASCAR AND DE- PENDENCIES, 236,900	3,800	Antananarivo, colony, <i>Governor-General</i> : M. Coppet.
REUNION, 920	210	St. Denis, colony, <i>Governor</i> : M. Aubert.
FRENCH EQUATORIAL AFRICA, 867,700 . . .	3,500	Brazzaville, <i>Governor-General</i> : M. Boisson.
GABON, 106,500 . . .	410*	Libreville, colony, <i>Lt.-Governor</i> : M. Masson.
MIDDLE CONGO, 159,700	747*	Brazzaville, colony, <i>Administrator</i> : M. Bahot- Launoy.
OUBANGUI-CHARI, 214,600	834*	Bangui, colony, <i>Lt.-Governor</i> : M. de Saint-Mart.
CHAD, 386,900 . . .	1,432*	Fort Lamy, colony, <i>Lt.-Governor</i> : M. Eboué.
FRENCH WEST AFRICA, 1,807,700	14,750	Dakar, <i>Governor-General</i> : M. Cayla.
SENEGAL, 77,000 . . .	1,790*	St. Louis, colony, <i>Lt.-Governor</i> : M. Parizot.
MAURITANIA, 330,000	383*	St. Louis, colony, <i>Lt.-Governor</i> : M. Beyries.
FRENCH GUINEA, 97,000	2,011*	Conakry, colony, <i>Lt.-Governor</i> : M. Giacobbi.
IVORY COAST, 183,000	3,851*	Abidjan, colony, <i>Lt.-Governor</i> : M. Crocicchia.
DAHOMY, 43,000 . .	1,352*	Porto Novo, colony, <i>Lt.-Governor</i> : M. Annet.
FRENCH SUDAN, 577,000	3,569*	Koulouba, colony, <i>Lt.-Governor</i> : M. Desanti.
NIGER, 500,000 . . .	1,747*	Niamey, colony, <i>Lt.-Governor</i> : M. Rapenne.
CAMEROONS, 161,200 .	2,400	Yaoundé, mandated territory, <i>Commissioner</i> : M. Brunot.
TOGOLAND, 20,000 . .	781	Lomé, mandated territory, <i>Administrator- Superior</i> : M. Montagné.
AMERICA		
FRENCH GUIANA, includ- ing Inini, 34,740 . . .	37	Cayenne, colony, <i>Governor</i> : M. Chot-Plassot.
GUADELOUPE, 600 . .	310	Basse-Terre, colony, <i>Governor</i> : M. Pierre-Allye.
MARTINIQUE, 386 . .	255	Fort-de-France, colony, <i>Governor</i> : M. Léal.
St. PIERRE AND MIQUE- LON, 93	4	St. Pierre, colony, <i>Administrator</i> : M. de Bournat.
OCEANIA		
NEW CALEDONIA AND DEPENDENCIES, 7,310	55	Noumea, colony, <i>Governor</i> : M. Pélicier.
NEW HEBRIDES, 4,620 .	60	Vila, condominium, <i>Resident-Commissioner</i> : M. Sautot.
PACIFIC ISLANDS, includ- ing Society Is., Tu- amotu Is., Tubuai Archipelagos, etc. 1,540	45	Papeete, colony, <i>Governor</i> : M. Chastenet de Géry.

*Population 1936 census.

President Daladier's triumphal progress through Tunisia and Algeria (January 1-8) revealed an unexpectedly intense hostility to foreign intrigues and this hostility increased after the occupation of Albania. In Tunisia the nomination of the new heir-presumptive to the throne, Tahar Bey, was peaceably effected.

There was intense military activity everywhere. The reinforcement of the Mareth Line, in effect another Maginot Line, 30km. from the frontier of Tripoli, as well as the organization of both men and materials in defence of the three regions, were the work of General Nogues, the resident general of France in Morocco, who had been appointed general of the army and commander-in-chief of operations in North Africa. Safe naval bases were assured in Tunisia, by the manning of Bizerta and the widening and dredging of the La Goulette canal; in Algeria by the completion of jetties for the El-Kebir and in Morocco by preparations at Agadir, while aviation was rapidly increasing. Steps were also taken to develop industrial production to supply the country with provisions should transport be interrupted.

Colonial Possessions.—In the colonies themselves the intense driving force of M. Georges Mandel made itself felt. In politics, the minister stated definitely that if France occupied overseas territories, it was in order to "enfranchise and set free," and in application of these principles a series of decrees was passed extending the rights of the native.

The principal task of the colonial minister, who had been admitted in May 1938 to the permanent committee for national defence, was to ensure the mobilization of the economic resources and military strength of the colonial empire. The results exceeded the most optimistic expectations. Whereas, from 1914-18 in 50 months, the colonies supplied 3,500,000 tons of produce and various commodities, in the last four months of 1939 they were able to send, 1,600,000 tons of cereals, the greater part being from Indo-China, 1,100,000 tons of oleaginous substances needed in Central Africa, 800,000 tons of various colonial commodities (meat, cocoa, tea, bananas, sugars, rum) and 800,000 tons of materials essential for industry (wood, 300,000; coal and various minerals, 350,000; rubber, 60,000; textiles, 40,000).

Assembling these forces of men and materials presented no difficulties. Thanks to the opening of special credits and to the subscription of loans, France was able to construct railroads in the Mossi country, the French West African reservoir of manpower; to open a transmauritanian track, four to nine metres wide, practicable for trucks between Senegal and Morocco thereby eliminating the sea route in troop transport, and to improve the ports of Jibuti, Dakar, Pointe Noire, thus completing the junctions Congo-Ocean, and Cam-Ranh, in Cochin-China. Finally, an agreement was signed between Indo-China and Siam to link them up by a railway.

French Equatorial Africa: see FRENCH COLONIAL EMPIRE.

French Guiana, a French colony in north-eastern South America including the separately administered interior territory of Inini. Language, French; capital, Cayenne (pop. 11,704); governor, René Veber. The area is 34,704 sq.mi., of which Inini comprises approximately 25,000 square miles. Including nearly 4,000 in Inini, the population is officially estimated at 37,000 aside from uncivilized Indians. About 6,000 are foreigners. The colony is administered by a governor and a general council, and has representation in the French parliament. Inini has its own council. The famous French penal colony, Devil's Island, located along the northern border, is administered separately. Plans to eliminate it made no headway during 1939, due to lack of penitentiary facilities elsewhere, and to the war.

French Guiana's imports are chiefly foodstuffs and manufactured goods, of which two-thirds come from France, the balance largely from the United States and from French colonies. Exports are principally gold, tulip-wood and other cabinet woods, rum and bananas. Virtually all are taken by France. In the first 11 months of 1938 imports were 50,900,000 francs, exports 42,800,000 francs. Uncertainty of communications under war conditions seriously hampered the export and import trade of French Guiana late in 1939.

The colony has regular external steamer and air transport service under normal conditions, 12km. of railway, 250km. of highways, and good interior waterways. The monetary unit is the French franc (value: 2.25¢ U.S.). There were 35 Government primary schools, with 2,724 pupils, four private schools with 793, and one secondary school with 130, in 1938. (L. W. BE.)

French Indo-China: see FRENCH COLONIAL EMPIRE.

French Literature. The year 1939 was marked by a national awakening in France, and literature powerfully felt its repercussions. It was a period of self-examination, and a mystic trend emerged which swept over all the manifestations of the spirit. Charles Péguy, the peasant-poet of Orléans, became the symbol of the spiritual renaissance. The war brought an apotheosis of this heroic figure who had fought for the reconstruction of France in prose and poetry before 1914 and who had died in the first battle of the Marne.

Surréalisme, which had given its name to the collective nostalgia for the fabulous and the romantic since 1923, was disintegrating. In the spring of 1939 a new movement sprang up which called itself *Vitalisme* and which announced its program for a new and saner order in literature through vigorous manifestations by Marcel Sauvage, Pierre Loiselet and Robert Gaillard. Although most of the advance-guard magazines—always the begetters of new movements—had to stop publication, because the editors were mobilized, they were immediately continued under reduced conditions at the front. The *journaux du front* began to blossom forth as early as November. Notable among these little blue- and khaki-coloured reviews were *Le Vitaliste*, *Franchise Militaire*, *l'Isard de Metz*. Older reviews, like the *Nouvelle Revue Française*, *La Revue des Deux Mondes*, *Revue de Paris*, continued their publications dividing their material between the military situation and literature. Paul Eluard published his *Chanson Complète* which marks his break with the surrealist technique. In this poem he forsakes his preoccupation with the unconscious universe and returns to a synthesis of clarity and classical beauty. Jean Cocteau revealed *l'Incendie*, a powerfully moving poem, which translates the strange atmosphere of Paris before Munich and the reactions of human love before the menace of destiny. A short time before the war, Cocteau issued his *La Fin du Potomak*, a story, half contemporaneous and half *fantaisiste*, which expressed his attitude in the political struggle of Europe. Pierre-Jean Jouve, author of *Sueur de Sang*, wrote his *Ode au Peuple*, and his *Chevaliers d'Apocalypse*, a grandiose series of eschatological poems, in which he transmitted his metaphysical disquiet and his hopes for France. He attempts to wed mysticism with modern psychology. St. Pol-Roux, the aged symbolist bard of Brittany, issued *La Supplique du Christ*, dedicated to Albert Einstein. It is a book of finely chiselled stanzas which passionately defends the Jews against their racist traducers. Paul Claudel, the greatest mystic Catholic poet today, at the age of 70, completed his *Jeanne d'Arc au Bucher*. This deeply religious work was received with enthusiasm when it was produced in Paris, with music by Arthur Honegger.

The most important among the younger French Catholic poets

is Patrice de la Tour du Pin. He continued his vast projected *Summa* with the publication of new excerpts, chiefly *Psaumes*. His *La Vie Récluse en Poésie* presents and explains the esoteric symbolism and nomenclature of his life-work. The young poet (born in 1911) went to war as a lieutenant and was wounded and taken prisoner in the first days of the fighting.

Criticism was characterized by a return to mystic and spiritual thinking. The analogy between the poetic and the mystic experience was emphasized in the essays published by Marcel de Corte, Raissa and Jacques Maritain, and Rolland de Renévill, while other critics, like Georges Bataille and Michel Leiris, sought this new mysticism in a study of purely mythological analogies. Thierry Maulnier alone defended a classical viewpoint in his *Introduction à la Poésie Française*.

The biggest book-success of the year was strangely enough André Gide's *Journal*. Its appearance as a book, after its fragmentary publication in reviews, created a sensation, and it became the book of the year. With great sincerity and passion Gide gives the reader an insight into his complicated mind. It is a deeply speculative confession revealing glimpses of his political, religious, literary and personal world.

Drieu de la Rochelle, who had been silent for some years, appeared with *Gilles*, the novel of a man's spiritual progress from 1917 to 1937. This recital of 20 years in the life of a man between two wars had a clinical interest, and reveals a fine panorama of the so-called post-war period. Léon-Paul Fargue presented his readers with *Le Piéton de Paris*, a richly metaphorical cinéma of his experience of the city Paris during the last 50 years. Fargue, a member of the Académie Mallarmé, stirred the reader with brilliant verbal inventions and a fine capacity for lyric story-telling. Jules Romains continued his *roman-fleuve* with two new books: *Vorge contre Quinette* and *La Douceur de Vivre*. His vast chronology is moving forward towards the euphoria of the post-war. Daniel Rops, in his *l'Épée de Feu*, told a vigorous story of the ideological conflicts that disturb our age. It is a brilliant dialectical effort, the synthesis of which he sees in a modernized Catholicism. Philippe Hériat won the *Prix Goncourt* with *Les Enfants Gâtés*. It is the story of a girl in revolt against her upper bourgeois family. A sentimental escapade in America liberates her, but when she returns, she submits again to the standards of an archaic family life. Jean Malaquais, a Pole writing in French, received the *Prix Renaudot* with his novel *Les Javanais*. It is the story of a colony of refugees working in a southern lead mine, written with a strong naturalistic style. Paul Vialar was the recipient of the *Prix Femina* for his *Rose de la Mer*. It is a series of delicately wrought psychological narratives of adventure. Roger de Lafforest was rewarded with the *Prix Interallié* for his *Les Figurants de la Mort*, the story of a Utopian general and his mythical conquest of a country. (E. Js.)

Freud, Sigmund (1856–1939), Austrian psychologist and founder of psychoanalysis, was born of Jewish extraction on May 6 at Freiberg in Moravia, then a part of Austria-Hungary. His parents moved to Vienna when he was four, and there he studied as a youth in the physiological laboratories under Bruecke and later at the Institute for Cerebral Anatomy. He was awarded his medical degree in 1881. In 1884 Dr. Josef Breuer, a Viennese physician, related to him the unusual case of "Anna O.," a young girl suffering from paralysis who had been

cured after recollecting, in a state of hypnosis, the origin of her symptoms. Freud, deeply impressed, went on to reconstruct the fundamentals of psychoanalysis. He went to Paris in 1885 to study under the French neurologist and hypnotist, Jean Charcot; upon his return to Vienna the next year he set up his practice and by 1895, when he collaborated with Breuer on *Studies in Hysteria*, he had definitely formulated the basic principles of psychoanalysis. Essentially these principles remained unchanged throughout his later years of research; they set forth the existence of powerful subconscious thought with its resulting "repressions" and "inhibitions" and the all-important role of the "libido," or sexual instinct, which accounts for such neuroses as the "Oedipus complex" or for great creative ability through "sublimation." After 1906 Freud was joined by other psychologists, notably Brill, Adler, and Jung, and in 1908 the first International Congress of Psychoanalysis was held. Both Adler and Jung later seceded from the Freudian school, however, Adler holding that not sexual desire, but a desire for superiority, is the mainspring of human behaviour.

The majority of Freud's works have been translated into English. One of the most famous is *The Interpretation of Dreams*, first published in 1901. In 1939, shortly before his death, he published *Moses and Monotheism*, in which he psychoanalyzed anti-Semitism and related the hatred of Jews to hatred of monotheism. His books were publicly burned in Germany after the Nazis' advent, and in June 1938, after the Austrian Anschluss, he moved to London, where he continued active research and directorship of the *International Journal of Psycho-Analysis*. Dr. Freud, who had been suffering for several years from advanced cancer, died September 23 at the home of his son, Ernst Freud, in Hampstead, England. For a biography, see *Encyclopædia Britannica*, vol. 9, pp. 836-7; see also Freud's article PSYCHOANALYSIS, vol. 18, pp. 672-4.

Fritsch, Werner von (1880-1939), German soldier, was born at Benrath, Silesia, on August 4, the son of an army officer. At the age of 18 he joined an artillery regiment and in 1900 he was commissioned lieutenant. During the World War he was a general staff officer with the rank of major and was decorated with both the Iron Cross, first and second class, and the Order of Hohenzollern. In 1922 he was advanced to lieutenant colonel and shortly afterward entered the ministry of defence as a colonel. In Oct. 1931 he was appointed to command of the First Cavalry division with the rank of major general; by October of the following year he was lieutenant general. Hitler appointed him in Feb. 1934 chief of staff of the German Army with the rank of general of artillery. Von Fritsch was apparently unenthusiastic about Nazi plans for a vigorous foreign policy, and in the army "purge" of Feb. 1938 he resigned and was replaced as commander-in-chief of the German Army by Gen. von Brauchitsch (q.v.). Hitler, however, was not unmindful of his general's excellent accomplishments in rebuilding Germany's military machine, and shortly after the "purge," the Fuehrer publicly conveyed to von Fritsch his "honest thanks for the work you did in the reconstruction of our defence force." When Germany invaded Poland in Sept. 1939 von Fritsch, though still retaining his rank of colonel-general, was placed in honorary command of an artillery regiment, and it was in this subordinate post that he was killed in action September 22, according to the Germans, "in the course of an offensive reconnaissance patrol before Warsaw."

Fruit: see APPLES; BANANAS; GRAPEFRUIT; GRAPES; LEMONS AND LIMES; ORANGES; PEACHES; PEARS; PINEAPPLES; PLUMS AND PRUNES.

Fuel: see COAL INDUSTRY; GASOLINE; NATURAL GAS; PETROLEUM.

Fuel Briquettes. The compression of finely divided or low grade coal into briquettes, to make it more adaptable as a fuel, has grown to an industry of considerable magnitude in a number of countries, especially those having large supplies of low grade coals. Some of the leading outputs in 1937 were as follows: United States 1,036,000 metric tons; Belgium 1,849,000 tons; Czechoslovakia 724,000 tons; France 7,957,000 tons; Germany 48,727,000 tons; Netherlands 1,327,000 tons. Total world production is estimated at 64,261,000 tons. In all of the leading European producing countries briquettes have an important place in export fuel trade; both France and Germany have net exports in excess of a million tons, while Belgium stands at about half that figure; Czechoslovakia had a small export surplus, but in Netherlands imports exceed exports. Imports into the United States are negligibly small, and exports are only slightly greater, chiefly to Canada. Although little of the United States output is exported, domestic consumption is widely distributed, shipments having been made in 1937 to 36 States, Alaska, and the District of Columbia. Included in the briquette output reported above, there was produced in 1937 in the United States 132,400 short tons of briquettes wrapped in paper for convenience and cleanliness in handling, the product being commercially known as "packaged fuel." (G. A. Ro.)

Fulda, Ludwig (1862-1939), German novelist, playwright, and translator, was born on July 15. He was educated at Berlin, Leipzig, and Heidelberg and received his doctorate from the latter university at the age of 21. Two of his plays were produced in New York city during the '90s and he became one of Germany's leading playwrights prior to the World War (1914-18). Fulda devoted much of his time to making the German theatre more cosmopolitan; he translated the works of Rostand, Molière, Ibsen, and the Spanish classical dramatists into German. At the time of his death he was honorary president of the International Confederation of Societies of Authors and Composers. Among his works were *Maskerade* (1904), *Der Vulkan* (1920), *Die Gegenkandidaten* (1923), and *Fraülein Frau* (1929). His two plays produced in America were *The Talisman* (1894) and *Old Friends* (1899). Though Jewish, Fulda did not leave Germany after the Nazis' rise to power. With Thomas Mann, Franz Werfel, and others, he was forced to resign from the Prussian Academy of Arts in 1933 and thereafter lived quietly in Berlin, where he died on March 30.

Fuller's Earth. Almost the entire output of fuller's earth is used in the bleaching of refined petroleum or other oils and fats, its original use in the cleansing of cloth having practically disappeared. The United States production had for several years stood at 200,000-230,000 short tons, after a decline of about one-third, but in 1938 dropped to 171,000 tons, in spite of increasing petroleum outputs. These decreases have been due to increased efficiency in use, the development of methods of re-activating the clay after use, and to substitution by other bleaching agents, especially bentonite. (G. A. Ro.)

Furniture Industry. America's 2,200 furniture factories regained most of the volume they lost in 1938 and finished 1939 with a total of approximately \$450,000,000, still 25% below 1929. Employment also increased to 115,000 men and wages advanced 6%, bringing annual wages for the industry to \$100,000,000. Back of the rapid recovery of the furniture industry was America's 1939 home building boom, the greatest in ten years.

Principal woods used by the furniture industry include mahogany, walnut, maple, oak, birch and aspen. Public style prefer-

ences determine which woods will be used. The present 18th century vogue makes mahogany more popular than formerly. Very little gum wood furniture is produced now. A survey of the June (1939) markets in Grand Rapids and Chicago showed the following woods used:

	1939 %
Walnut	33.0
Mahogany	31.7
Maple	7.6
Oak	3.1
Orientalwood	3.0
Philippine woods	2.5
Aspen	1.0
Satinwood	1.5
Enamel	1.2
Miscellaneous solid woods*	3.5
Miscellaneous veneers†	9.1
Imitations	2.8
	<hr/> 100.0

*All domestic and foreign solid woods not separately listed above.
†All domestic and foreign veneers not separately listed above.

The following shows the elements of cost for each \$100 worth of furniture produced in 1938:

Materials (Lumber, finishing materials, etc.)	\$40.80
Direct Labour	22.84
Factory Overhead	18.77
Sales Expenses	10.00
Administrative Expenses	7.49
Total Costs	<hr/> \$99.90

Abroad.—England supplies most of the better furniture used in South America and has about 100 large factories and several thousand small ones. Canada has about 100 furniture factories and imports both American and English furniture. France has 50 large furniture factories, most of its plants being small. Germany has approximately 150 large furniture plants and more than 1,000 small ones. Her market is largely through Central Europe. As a result of the European war, the United States may expand its furniture market in Canada, South America, and Mexico. (J. A. G.)

Furs. The fur trade was inactive and unprofitable during the first half of 1939. In London, New York, Montreal, Paris, Oslo, Sydney, Shanghai, Tientsin, all important fur markets, the approaching war in Europe overshadowed all other events, political and economic. Fur skin prices during the late winter and spring of 1939 were easy and were little, if anything, above the prices ruling at the end of 1938.

The picture changed when war was declared in Europe. For a while there was a little confusion, but the American trade, remembering the experiences of the previous great war, kept its head and speculative tendencies were quickly curbed. Prices were held down, even though consumer demand increased steadily during the fall and winter months. Retail sales of fur during the second half of 1939 averaged about 25% more than in the corresponding period in 1938. A much larger volume of furs was actually sold at wholesale than in 1938, but low prices prevented any noticeable gain in wholesale dollar volume.

Stocks of fashionable furs, such as muskrat, beaver, Chinese kid, fitch, marmot, skunk, broadtail, lynx, marten showed moderate price gains towards the end of 1939. Other fur skins failed to show any advance in price, as compared with 1938. The jacket style of garment sold in the greatest volume. The brown- or mink-dyed furs gained in popularity. Silver fox, mink, Persian lamb (black and gray), mink-dyed muskrat, skunk, beaver, brown-dyed fitch and squirrel were the "furs of the year."

United States imports for the period Dec. 1938 to Oct. 1939 were valued at \$46,727,841, or \$3,253,523 more than for the corresponding period in 1937-38. Increased quantities of heaver,

rabbit, hare, kolinsky, mink, muskrat, opossum, squirrel, weasel, and silver fox were imported. Other items remained at practically the same import figures as in 1938. The principal sources of supply were Russia, Canada, Great Britain, China, and Australia, and France for rabbit fur.

The duty on silver fox imports was reduced from 50% to 37½% on Jan. 1, 1939. The U.S. imported over 85,000 silver fox, principally from Canada and Norway. The American fur breeders appealed to the U.S. Government to limit the imports of silver fox skins from foreign countries to 100,000 skins for the season of 1939-40. Closing of European markets threatened to result in the dumping of silver fox skins in the American market. Prices on silver fox fell 25% in Dec. 1939 and 35% on ranch mink, compared with Dec. 1938. Fur exports totalled, for the Dec. 1938 to Oct. 1939 period, \$11,957,346, or \$1,226,651 less in value than in 1938. The number of skins exported, however, was greater with more muskrat, raccoon, and opossum shipped abroad than in 1938.

Insolvencies in the American fur trade up to the end of Nov. 1939 totalled 186 cases. In New York city area there were 128; elsewhere 58. The total of failures was higher than the 1934-38 average of 149. Liabilities amounted to \$3,624,114.

The International Fur Workers Union succeeded in organizing the employees in the fur merchants and skin dealers branch of the trade. At the opening of the new raw fur season in Nov. 1939, the American fur trade faced the problem of probably having to handle a much greater proportion of the world's fur skins than ever before. The market of Europe, which annually consumes more than half of the world's fur production, ceased to function normally on the outbreak of war.

Governments placed drastic restrictions on fur imports and exports. There developed the possibility of enormous quantities of fur merchandise coming to New York, since it was at the end of 1939 the only "free" market. Evidence of this in the flight of foreign capital from Europe to New York, some of it in the form of fur merchandise, created a serious problem for the American fur trade. It brought a definite weakening of pelt prices late in the year. The United States, under favourable conditions, could consume as much as 55% of the world's peltries, but any quantities over and above this will cause serious overloading of the American market. (W. J. Br.)

Gambia: see BRITISH WEST AFRICA.

Gamelin, Maurice Gustave (1872—), French soldier and, since June 6, 1939, supreme commander of all French armed forces. Son of a general, he was born in Paris and educated at St. Cyr. He was chief of staff of Gen. Joffre in 1914 and played an important part at the battle of the Marne; it was he who was reputedly most insistent in his prophecies that Germany would invade France by way of Belgium. During the course of the World War he was promoted general of brigade and in 1917 commander of a division. After the war he was head of a military mission to Brazil until 1925, when he was appointed commander of French forces in the Levant. He became chief of the general staff in 1931 and vice-president of the general council of war and inspector-general in 1935. During the several crises of 1938 and 1939 he was responsible for the partial French mobilizations; in Sept. 1938 he expressed the view, in a report to Premier Daladier, that France should intervene in the German-Czech crisis despite several shortcomings in military preparedness. After France declared war on Germany Sept. 3, 1939 Gamelin proceeded with caution, apparently wishing to avoid "another Verdun" at Germany's Westwall and to conduct slow offensives with a minimum loss of manpower.

Gandhi, Mohandas Karamchand (1869–), Hindu nationalist leader, was born at Porbandar (Kathiawar), India. For his biography, see *Encyclopædia Britannica*, vol. 10, p. 15. After the elections for the provincial legislatures in 1937 had resulted in the Congress party's gaining a majority in six provinces, Gandhi recommended that the party accept office if assurances were given that the governors would not use their veto. At Madras on Jan. 22, 1937, Gandhi announced his retirement from active Indian politics, but in 1939 he achieved two notable political victories. In the first he employed his famous weapon of "fast unto death" to protest against the administration of the Thakore Saheb of Rajkot. After Gandhi had passed four days (March 3-7) without food, the ruler of Rajkot capitulated, and the British viceroy, the marquess of Linlithgow, agreed to submit the dispute to the Indian chief justice. His second victory came on April 29 when his opponent, Subhas Chandra Bose, was forced to resign as president of the Congress and was replaced the next day by Rajendra Prasad, a disciple of Gandhi. It was evident from events of the year, that Gandhi's political influence, which had apparently been waning, was again in the ascendancy. He added his bit to international efforts for peace in September when, according to reports, he dispatched a personal appeal to Hitler. After hostilities broke out, Gandhi sought a declaration of British war aims concerning India and demanded Indian independence at the end of the war. Irritated at what he apparently considered temporizing statements by the British viceroy, Gandhi, through the India Congress, ordered eight provincial ministries to resign in protest October 22.

Gas Masks: see CHEMICAL WARFARE.

Gasoline. The production and utilization of gaseous fuel in European countries was greatly expanded in 1939, partly because of the impetus given by the war and partly because of the fruition of programs launched some years ago to build up supplies as a substitute for motor fuel from petroleum. In these countries coal and lignite are the important raw materials used. While this development, induced by the dependence of these countries on outside sources for fuel, went on apace, in the United States there was great expansion of manufacture and use of gaseous fuel, derived from petroleum and natural gas. It is interesting to note that whereas in Europe the products of coal carbonization are developed largely as a substitute for petroleum products, in the United States processes not always wholly dissimilar are applied to petroleum as the raw material, and that the resultant gaseous fuel not only may be directly used as fuel for motor cars or for heat and cooking but also is providing spectacular results in making available in commercial quantity high octane-number aviation fuels.

Germany's production of synthetic gasoline from coal and lignite is unofficially estimated at 12,750,000 bbl. in 1938, a fivefold increase over 1933, and further increase is anticipated in 1940 with the completion of the first units of the world's largest synthetic gasoline plant being built near Stettin for the conversion of oil residues and Silesian coal into motor fuel. (See PETROLEUM.) Germany has been engaged in supplying a large part of her fuel requirements from coal products for several years, the industry being under Government protection and subsidy. At most she succeeded in supplying no more than 25% or 30% of her normal requirements from this source; but this greatly exceeds the ac-

complishment of any other country. In England gasoline from coal represents only about 4% of the United Kingdom's motor fuel requirements. The industry has been developed under Government subsidy.

France and Belgium also have subsidized this development but the production represents but a relatively small per cent of total motor fuel requirements. The United States has practically unlimited coal reserves available as motor fuel sources. While a substantial production of benzol as a motor fuel derived from coking operations is obtained, the total is insignificant as compared with gasoline obtained from petroleum.

In the meantime in the United States a large by-product industry utilizing petroleum gases has been built up. This "bottled gas" goes into suburban and rural homes as fuel for cooking, heating and refrigeration. Chiefly supplied from natural gas, in the production of natural gasoline, and from refinery gases, these gases are generally liquefied under moderate pressure so as to facilitate storage and transportation. The product also is used as a fuel in motor buses and rail cars.

Gaseous hydrocarbons, natural gas and refinery gas are becoming increasingly valuable as charge stock at petroleum refineries for the production of gasoline and particularly of high octane or aviation fuel. This began with the now well known polymerization process. Normally gaseous hydrocarbons, because of their high volatility, find only a limited use in gasoline; but it has been determined through the polymerization and other processes that they are capable of being transformed into high octane fuels of very great value.

There were in 1939 between 50 and 75 polymerization units operating in the United States.

Announced in 1939 was the sulphuric acid alkylation process representing the combined efforts of the Anglo-Iranian, Humble Oil, Shell Development, Standard Development, and Texas companies' research staffs. These companies, working independently, had developed processes which, though somewhat different in details of operation and in the results obtained, were in principle essentially similar. It was announced that in the best interest of the petroleum industry as a whole and in order that a major new source of high octane aviation fuel should be made available for national defence without delay or waste of correlative experience, their efforts had been combined to expedite the commercial application of the process.

This process affects directly the union of isoparaffins with olefins in approximately equal volumes to form branched-chain paraffins in the presence of strong commercial sulphuric acid as the catalyst, and in a single-stage operation. Thus a new source of high octane gasoline is available, and, with sufficient isoparaffin, potential yields of branched-chain product by alkylation from a given refinery stream are more than double those obtainable by the existing two-stage process of olefin polymerization followed by hydrogenation. Standard materials of construction are used in the six alkylation plants in operation in 1939 and the others under construction.

The catalyst is of universal availability.

Another commercial catalytic process has been developed which adds enormously to the potential gasoline supply for aviation and motor vehicle use. This is the catalytic dehydrogenation process and applies to the conversion of gaseous paraffins, except methane, into the corresponding olefins and hydrogen. The paraffins are derived from natural gas, casing-head gas, refinery gases and gases from other sources such as coal.

U. S. Consumption.—The year 1939 goes down as a record-breaker in motor fuel or gasoline consumption in the United States. Preliminary estimates for the year show a domestic motor fuel demand of more than 551,000,000 bbl. compared with 523,-

103,000bbl. in 1938, an increase of 5%.

In 1937 domestic demand totalled 519,352,000bbl. and in 1936, 481,606,000 barrels.

The effect of the war in Europe on American gasoline manufacture and exports is yet to be determined. While the Allies are expected heavily to increase their buying, the fact remains that gasoline consumption for non-military purposes in Europe is greatly restricted and normal supplies to fill this need will not be required.

Tankers to move American gasoline in helligerent waters must be provided, as under the United States Neutrality Act American ships must keep out of war zones.

It is to be presumed that Allied demand for gasoline will be largely concentrated on high octane motor fuel for aviation purposes. In the United States also a great expansion of military and civilian aviation is being launched.

This specialized demand in the U.S. and Europe has resulted in a speeding up of development of aviation fuel processes by American refineries.

Six new methods of producing aviation fuel base stock or high octane blending materials were discussed at the annual meeting of the American Petroleum Institute in Nov. 1939. These are thermal and catalytic alkylation, Houdry catalytic reforming, catalytic dehydrogenation of gaseous paraffins to olefins and two processes for complete desulphurization. Also considerable importance was attached to improved tetra-ethyl lead response of these gasolines in boosting octane number.

The importance of these processes to aviation cannot be over-emphasized. Higher octane fuel generally available means to the aeroplane greater speed, less fuel to be carried, greater range and greater load-carrying capacity. In the last two or three years new refining processes have enabled the oil industry to make commercially available 87 octane-number aviation fuel. Now the aim is to provide 100 octane fuel. In 1939 aviation fuels with octane ratings approaching 100 and above were increased greatly in commercial availability. In 1937 the domestic consumption of 100 octane aviation fuel was approximately 7,000,000gal., and it has been estimated this increased to 20,000,000gal. in 1938.

The anticipated consumption for 1939 and 1940 is greatly in excess of these figures, and with the assurance of a larger supply of 100 octane fuel at a reasonable price, a further increase undoubtedly will result from changes in aeroplane motor design to take advantage of the better performance and economy possible when operating with such a gasoline.

World Consumption.—By far the greatest consumption of gasoline is by motor vehicles. The United States, with over 65% of the world's registered motor vehicles, needs and consumes by far the greatest quantity. Other countries on the Western Hemisphere account for 5.12% of the world's motor vehicle registration; Europe, for 20.9%; Africa, for 1.5%; Asia, for 1.5% and Oceania, for 2.6%; this being an indication of the relative geographic consumption of gasoline.

In the United States increased motor vehicle consumption of gasoline is expected to continue. On top of that is the evident tremendous increase in aviation consumption in the United States and in Europe, with American refineries being called upon to supply the major part of that demand.

It is estimated that about 90% of all gasoline consumed in the United States is by motor vehicles. Aviation gasoline consumption totals only about .4% of the entire gasoline consumed, divided as follows: For commercial aviation .24%, and for the Army Air Corps, National Guard, Bureau of Aeronautics, Navy Department (including Marine Corps), U.S. Coast Guard and Bureau of Air Commerce, .16%.

Gasoline consumed by agriculture in the United States accounts

WOOD-BURNING TRAILERS attached to German motor cars convert combustion gases into fuel for the car

for 5.53% of the total gasoline consumption, divided as follows: For tractors 4.42% and for other farm uses 1.11%. Highway construction agencies consume 1.03% and other construction operations 1.06%. About .3% is consumed by manufacturing industries; .28% by the U.S. Government; .08% for dry cleaning; .02% by the railroads. Use of gasoline by boats is extensive but only a small percentage of the total gasoline consumed, about .16%.

Undoubtedly the most significant development in gasoline consumption is the expansion of aviation resulting from war and war preparation and the resultant effect it will have on establishing civilian and commercial aviation on a plane possibly comparable to the expansion of the use of the automobile during the last quarter century. (See also PETROLEUM.)

Gaster, Moses (1856-1939), British-Rumanian Hebrew scholar and linguist, was born in Bucharest. Educated at Bucharest university and at the University of Leipzig, where he received his Ph.D. in 1877, Gaster was expelled from Rumania in 1885 for protesting vigorously against the Government's anti-Semitism. Years later, when he had attained renown as one of the foremost scholars of his day, Rumania awarded him the Order of Merit and invited him to return to Bucharest, but he declined. Establishing his residence in England in 1886, he delivered the Ilchester lectures at Oxford on Slavonic and Byzantine literature. He took an active part in English and Jewish political life and was thrice vice president of the Zionist congress at Basle and London. From 1887 until his retirement in 1919 he was chief rabbi of the Sephardic Communities of England. He was an officer also of the Folklore Society of England, the Anglo-Jewish association, and the Royal Asiatic society and a Fellow of the Royal Society of Literature. He was author of many volumes and articles on philological, historical, and Biblical subjects. He died March 5 while motoring from Oxford to Reading. A biographical notice of Gaster appears in *Encyclopædia Britannica*, vol. 10, p. 54.

Gates, Milo Hudson (1866-1939), U.S. Protestant Episcopal clergyman, was born June 29 at Gardner, Mass. From 1907 to 1929 he was vicar of the Chapel of the Intercession, Trinity parish, New York city, and he was dean of the Cathedral of St. John the Divine in New York city from 1930 until his death on Nov. 27, 1939.

Gay, Frederick Parker (1874-1939), U.S. pathologist and bacteriologist, was born at Boston on July 22. He was educated at Harvard and at Johns Hopkins, where he received his medical degree in 1901. After teaching at the University of Pennsylvania, Harvard, the University of California and other institutions he joined the faculty of Columbia university, where he taught bacteriology until his death. He was noted for his researches into typhoid fever, sleeping sickness, immunity, and the effect of the new drug sulphanilamide upon streptococcus infections. Among his publications were *Studies in Immunity* (1909) and *Typhoid Fever* (1918). He died at New Hartford, Conn., on July 14.

General Federation of Women's Clubs: see WOMEN'S CLUBS, GENERAL FEDERATION OF.

Genetics. The seventh International Congress of Genetics convened in King's Buildings, University of Edinburgh on Aug. 22, 1939. Dr. F. A. E. Crew was elected president. In attendance were over 500 delegates, from all the civilized world. On the program were over 350 papers. Because of the international crisis most of the delegates other than British and American left within three days.

Cytogenetics.—Using the larval tail-tips of the salamander, *Eurycea bislineata*, Fankhauser has extended his significant studies on polyploidy in the amphibians. Following the discovery of Eigsti that treatment with the drug, colchicine, induces polyploidy in plants, workers in 1939 reported chromosome doubling by use of this drug on pine, wheat, oats, barley, tobacco, buckwheat and onion.

By colchicine treatment Smith, Warmke and Blakeslee have obtained fertile tetraploid hybrids in crosses of *Nicotiana* (tobacco) species, which normally give sterile hybrids. Sears has obtained similar results in grasses. Goodspeed and Avery have made a comprehensive report of trisomics and other chromosomal variants in *Nicotiana glauca*. Kaufmann has made a detailed study of the several types of intra and interchromosomal rearrangements following X-raying in *Drosophila melanogaster*. He reports non-random breakage along the X-chromosome. The morphology and inversions of the salivary chromosomes of natural populations of *Drosophila azteca* have been investigated by Dobzhansky and Socolov, and of *Drosophila algonquin* by Miller.

Genetics and Evolution.—There has been a definite trend from strictly laboratory toward field-laboratory investigations in experimental evolution on the combined basis of ecology, genetics and cytology. Gene frequencies in natural populations of *Drosophila melanogaster* have been analyzed by Plough and Ives; similar studies have been carried on by Dobzhansky in *Drosophila pseudoobscura* and by Gordon, Spurway and Street in *Drosophila subobscura*. Important cytological investigations on hybrids in *Drosophila virilis* subspecies have been reported by Hughes; on *melanogaster simulans* by Horton; and on *Sciara* species by Metz and Crouse. Anderson has demonstrated limited recombination of factors for corolla shape and colour in *Nicotiana* species crosses.

Human Genetics.—New pedigrees of human inheritance too numerous to mention have been published. In answer to the question, "How could the world's population improve most effectively genetically?" 21 leading geneticists attending the International Congress signed a statement containing in brief the following: genetic improvement of the race depends on major changes in social conditions and correlative changes in human attitudes; on removal of race prejudices; on economic security for parents and particularly for mothers; on the legalization and practice of birth control, both negative and positive; and on a wider knowledge of fundamental biologic principles.

New Books.—*An Introduction to Genetics*, Sturtevant and Beadle, is particularly strong in its presentation of the intricacies of chromosome structure and behaviour. *An Introduction to Modern Genetics*, by the British embryologist, Waddington, presents genetics in relation to embryology, evolution and human affairs. Muller has published a comprehensive *Bibliography of the Genetics of Drosophila*, including 2,965 titles. Complete through 1938, this bibliography is invaluable to the student of theoretical genetics.

Geographical Society, American: see AMERICAN GEOGRAPHICAL SOCIETY.

Geology. As a result of the increasing number of applications and adaptations of geology to mineral exploration and engineering projects it is becoming more quantitative in character.

Geomorphology.—Within the past few years this branch of geology has become definitely established in America. During 1939 two important textbooks appeared, namely: *A Textbook of Geomorphology* by Worcester and *Geomorphology: An Introduction to the Study of Landscapes* by Lobeck.

Physical Geology.—Several significant short papers on various phases of physical geology and three revisions of widely used American texts appeared in 1939.

Historical Geology.—The usual number of contributions dealing with the geologic history of local areas were published during 1939. An excellent text by Wells with emphasis on the geology of the British Isles was issued in London. A valuable theoretical contribution by Grabau on the Ordovician formations of the Caledonian geosyncline appeared as volume 4 of the series entitled *Paleozoic Formations in the Light of the Pulsation Theory*.

Palaeontology.—Continued interest in micropalaeontology is manifested by the issuance of numerous descriptive papers and bibliographies. Of particular interest is the detailed catalogue of the Foraminifera nearing completion under the direction of Brooks F. Ellis. During 1939 there was published a notable book by Raymond entitled *Prehistoric Life*. An excellent treatise on *Principles of Paleobotany* by Darrah, representing volume 3 of the *New Series of Plant Science Books*, was published in Holland. Of importance to vertebrate palaeontologists is the new book on *Paleozoic Fishes* by Moy-Thomas.

Sedimentology.—In recent years the necessity for obtaining detailed information on sedimentary processes has been appreciated. In accord with this trend two important symposia on recent sedimentation came from the press. "Sediment-Heft" (*Geol. Rundschau*, volume 29) presents the results of European investigations. *Recent Marine Sediments* edited by Trask under the auspices of the National Research Council includes important American contributions. The appearance of a *Textbook on Sedimentation* by Twenhofel emphasizing environmental conditions marks an important step forward.

Structural Geology.—Emphasis is being placed on the broader aspects of the earth as a whole. The *Architecture of the Earth* by Daly (1938) synthesizes the causes and results of deformation and vulcanism as inferred from seismic studies and geologic field data. A series of papers, edited by Gutenberg, appeared in *Internal Constitution of the Earth*, comprising volume 7 of the *Physics of the Earth Series*, a National Research Council project.

Regional Geology.—The first of a three volume reference work, entitled *Geology of North America*, edited by Ruedemann and Balk, appeared. Eastern North America including Greenland is described.

Mineralogy.—Investigations on the atomic structure of rock-forming silicates have shown continued progress. A compilation of new mineral names with citations to the original literature and diagnostic physical properties was published by English as *Descriptive List of the New Minerals 1892-1938*.

Petrology and Petrography.—The two significant trends in petrology appear to be the emphasis on phase relations of minerals in metamorphic rocks and on petrofabric analysis with the Universal stage. A *Manual of Sedimentary Petrography* by Krumbein and Pettijohn (1938) gives statistical methods and procedures in the mechanical analysis of sediments.

Economic Geology.—Attention has been focused on strategic minerals as a result of the unsettled world conditions. The United States Government appropriated funds for studies of domestic reserves of chromium, manganese, tungsten, tin and other minerals essential to national economy. The recent appearance of *Strategic Mineral Supplies* by Roush is timely. In the field of petroleum geology the discovery of oil in commercial quantities in Mississippi and Nebraska and the rapid development of new productive areas in the Illinois basin were outstanding events. The research committee of the American Association of Petroleum Geologists has been active in stimulating studies of the so-called stratigraphic traps. A well rounded text entitled *Les Gisements de Petrole* by Macovei was published in Paris in 1938.

Engineering Geology.—The importance of geology in construction and reclamation work is receiving greater recognition. A new text *Geology and Engineering* by Leggett emphasizes the value of geology in large scale construction and underground operations.

Seismology.—*Studies on the Periodicity of Earthquakes* by Davison marks an important contribution in this field.

Geologic Lexicons and Source Books.—*Geology and Allied Sciences* by Huebner gives the German equivalents and definitions of 25,000 English geologic terms. *Lexicon de Stratigraphie: Africa*, vol. 1 (1938), edited by Haughton, gives the names, lithology and characteristic fossils of African stratigraphic units. The *Lexicon of Geologic Names of the United States* by Wilmarth, published by the United States Geological Survey (1938), gives essentially the same data for geologic units in North and Central America, Alaska and Hawaii. A *Source Book in Geology* by Mather and Mason presents collateral readings from the works of outstanding contributors to geologic science up to 1900. *Birth and Development of the Geologic Sciences* (1938) by Adams is a more academic work dealing with geologic concepts in ancient and mediaeval times and supplements the classics of von Zittel and Geikie. (See also MINERALOGY; PALAEOLOGY; SEISMOLOGY.) (F. M. V. T.; J. C. HF.)

George VI (1895–), King of Great Britain and Ireland (see *Encyclopædia Britannica*, vol. 10, p. 191), in his 44th year and the third of his reign, had forced on him the sad duty of leading his Empire at war. Both before and after its outbreak he paid many visits to establishments of all the armed forces, to armament works, anti-aircraft, A.R.P. and nursing

centres, etc.; early in December he spent some days inspecting the British Expeditionary Force in the front line in France; while by his speeches at the prorogation (November 23) and opening (November 28) of parliament no less than by his broadcasts on September 3 and Christmas Day he further encouraged his peoples in their determination to meet—in his own words—"the challenge of a principle which, if it were to prevail, would be fatal to any civilized order in the world."

Earlier in the year among a number of State engagements such as the launching of the 35,000-ton battleship "King George V" at Newcastle (February 21), visits to the British Industries Fair, and the opening of the rebuilt Westminster hospital (April 30), there were two outstanding events, viz., the state visit of the President of the French Republic (March 21-24) and the royal tour in Canada and the U.S.A.

The former was a return for the reception accorded to King George and Queen Elizabeth in Paris in 1938, and was a diplomatic as well as a great social success; the latter was the first occasion on which any British monarch had acted as such in any of the sister Dominions of the Empire, and during it for the first time in history the United States Congress received a foreign king.

Two days before their tumultuous send-off from Portsmouth (May 6) the King and Queen were entertained at dinner by the American ambassador, and from their arrival at Quebec (May 17—two days late on account of weather conditions) until their return, the tour was a succession of enthusiastic demonstrations both on the part of the King's subjects and the citizens of the United States. It led from Quebec to Montreal, Ottawa, Toronto, Winnipeg, Calgary and across the Rockies to Vancouver and Victoria, B.C.; thence back via Edmonton and Saskatoon to Winnipeg and so to Niagara Falls whence (June 7) the royal party entered the United States and proceeded to Washington.

On the following day the King and Queen, after a British Embassy garden-party, attended a State dinner and reception at the White House; on the 9th came their reception at the Capitol, visits to Mount Vernon and the Arlington National Cemetery, and their departure for New York city where, especially en route to the World's Fair, on the 10th they received an ovation which in cordiality, sincerity and spontaneity was unsurpassed during the tour. A quiet stay at the President's home, Hyde Park, preceded the return to Canada, and after further loyal receptions in New Brunswick, Nova Scotia and Newfoundland, the King and Queen embarked at St. John's on June 17 on the return journey, reaching Southampton on June 22 and rounding off the memorable episode with an historic speech at the London Guildhall on June 23 and attendance at a thanksgiving service in Westminster Abbey on July 2.

The remainder of the year was spent entirely, as mentioned above, in duties connected first with the crisis and then with the war itself; and among other griefs that he suffered at this time were the long separation (end-August to Christmas) from his children, the Princesses Elizabeth and Margaret Rose, and the death (December 3) of his great-aunt, Queen Victoria's fourth daughter, Princess Louise, at the age of 91. (See also CANADA: *Tour of the King and Queen*; UNITED STATES.) (L. H. D.)

Georgia, one of the original States of the United States, popularly known as the "Empire State of the South"; area 59,262 sq.mi., being the largest east of the Mississippi river; population according to the U.S. census of 1930, 2,908,506, estimated July 1, 1937, 3,085,000. Capital, Atlanta, 270,366, estimated July 1, 1937, 280,400. The next largest city is Savannah, 85,024. Of the State's population 895,492 are urban, or 30%; 1,836,924 whites; 1,071,125 coloured; 407 other races; 13,917 foreign-born.

History.—E. D. Rivers, elected governor in 1936, on a program of support of the New Deal, was renominated in the primary of Sept. 14, 1938. In his campaign he sought endorsement for what he had done during his two-year term and an opportunity to complete his program.

The county unit system of voting prevails, whereby the smaller counties have one vote each and the most populous only three. Rivers received 282 unit votes, his opponents Hugh Howell and John J. Mangham securing 126 and 2 respectively. In the election in November 1938 the Democratic ticket had no opposition as the Republicans seldom make nominations for State offices. The principal State officers were: E. D. Rivers, governor (Dem.); John B. Wilson, secretary of State; M. J. Yeomans, attorney-general (he resigned during the year and was succeeded by Ellis Arnall); George B. Hamilton, treasurer; Zach Arnold, auditor; William B. Harrison, comptroller; M. D. Collins, superintendent of schools, and Columbus Roberts, commissioner of agriculture. The chief justice of the Supreme Court, Richard B. Russell, Sr. died in 1938 and was succeeded by Charles S. Reid. The campaign for renomination of Senator Walter F. George was of national significance on account of President Roosevelt's attempt to "purge" him, in his Barnesville address, in Aug. 1938. He was opposed by Lawrence Camp, the President's choice, and by Eugene Talmadge, a bitter critic of the President. George won with 246 unit votes, Camp receiving 16 and Talmadge 148. In the election in November 1938 he was unopposed.

Banking and Finance.—For the year ending June 30, 1939, the common schools received \$11,645,000; the various eleemosynary institutions, \$3,154,000; and the University system (embracing all higher educational institutions supported by the State), \$1,768,000. The State appropriated for the Public Health Department and the tuberculosis hospital \$826,000. The Highway Department received \$14,773,000. The total revenues received for the same period amounted to \$43,519,000, the tax on motor fuel producing the largest amount, \$20,529,000. Other important sources were the income tax, \$4,979,000; the general property tax, \$4,941,000; cigar and cigarette tax, \$2,761,000; motor vehicle registration, \$1,875,000; insurance premium tax, \$1,165,000; malt beverage and wine tax, \$1,342,000; and alcoholic beverage tax, \$1,669,000. Poll taxes amounted to \$261,000. Georgia received from the United States Government grants amounting to \$11,868,000. The bonded debt was \$3,569,000. In 1939 there were 240 State banks with resources of \$179,420,000.

Agriculture.—In 1935 there were 250,544 farms and 164,331 croppers and tenants. In 1939 the principal crops were cotton, 916,000 bales; tobacco, 96,620,000 lbs.; sweet potatoes, 8,892,000 bu.; Irish potatoes, 1,386,000 bu.; corn, 36,941,000 bu.; wheat, 1,770,000 bu.; oats, 8,946,000 bu.; apples, 450,000 bu.; peaches, 4,290,000 bu.; sugar cane sirup, 1,024,000 gal.; pecans, 8,700,000 lbs.; peanuts, 341,250,000 lbs.; and watermelons, 9,390,000. The total value of the main crops produced in 1939 was \$141,933,000, 6% below the value for 1938.

In 1939 the State had 970,000 cattle, 1,554,000 hogs, 31,000 horses.

The Census of Manufacturing of 1937 credited Georgia with a total value of \$708,652,000, about five times the value of the agricultural output. Since the raw materials of manufacturing are, however, largely agricultural in origin, a fairer comparison is that with "value added by manufacturing." In 1937 this value was \$269,500,000, less than double the agricultural output, but still significant of trends in a primarily agricultural state.

Georgian S. S. R.: see UNION OF SOVIET SOCIALIST REPUBLICS.

German-American Bund

is the successor of an organization known as the Friends of the New Germany. Fritz Kuhn got control of it in 1936 and changed its name and reorganized it. Kuhn is a native of Germany, served in the German Army and was with Hitler in the abortive beer hall putsch in Munich. He has been an American citizen for about 18 years and when he took control of the organization he was working in the chemical department of the Ford Motor Company in Detroit. The Bund, as described by its publicity director, "is an organization of United States citizens, in the main of German extraction, accepting as members all Aryan (white gentile) citizens of the United States of America in good standing, fighting for Christian, gentile American nationalism under the traditional American constitutional system and hence fighting for outlawing all Jewish, atheistic, international Marxism and related phenomena." A circular setting forth its aims announces among other things that the swastika has already become the common sign of recognition of defenders of Aryan nationalism "against the Bolshevik scourge in Germany" and other countries. At a crowded meeting in Madison Square Garden in New York city on Feb. 20, 1939, in observance of Washington's birthday, speeches were made intended to arouse hostility against the Jews and to defend the Hitler program.

Kuhn, who was summoned to Washington in the winter to appear before the Dies Congressional committee investigating un-American activities, testified that the Bund had 71 branches with 20,000 members in 19 States of which 23 were in New York. A witness from the Department of Justice, however, testified later that after a thorough investigation it was impossible to find more than 6,614 members. Kuhn defended the anti-Jewish activities as necessary if an Aryan democracy was to be preserved in the United States. Other witnesses before the committee testified that the Bund received financial support from Germany and that in spite of its protestations of support of the American system of government it was actively engaged in propaganda in behalf of the totalitarian system of the Nazis.

The Bund supports several newspapers devoted to furthering its purposes by attacks upon the Jews and by elaborate defence of what Hitler has done and is doing. The Federal Bureau of Investigation reported after inquiry that the Bund planned to open camps near every military post and every navy yard to enable it to attract officers and men to its meetings and induce them to co-operate with it. Camps operating as clubs have been maintained by branches in some of the States.

The treaty between Hitler and Stalin, disclosed in late 1939, indicated that the hostility between the Nazis and the Communists was not so real as the Bund members had supposed and that the totalitarianism of the two was practically identical. This revelation was followed by a decline in membership and a modification in the form of propaganda circulated.

In early 1939 there were rumours that Kuhn had been using the funds of the Bund for his own purposes. Following an inquiry by the district attorney of New York county—the headquarters of the Bund are at 178 East 85th street, New York city—Kuhn was indicted for theft and falsifying the records. He was tried in the fall of 1939 and proof was submitted in support of the indictment. He was convicted on Nov. 29, 1939, and sentenced to from two-and-a-half to five years' imprisonment in Sing Sing. He is succeeded as head of the organization by G. Wilhelm Kunze, its publicity relations director.

(G. W. Do.)

Germany, a totalitarian State or dictatorship, known as the Third Reich, in Central Europe south of the North and Baltic seas and north of the Alps and Yugoslavia, bounded west by France, Belgium, and the Netherlands, and east (in 1939)

by Lithuania, U.S.S.R., and Hungary. From 1919 to 1939 East Prussia was separated from the main territory of Germany by the so-called Polish Corridor. Capital, Berlin; Reich Chancellor and Leader (*Fuehrer*), Adolf Hitler (*q.v.*).

Area and Population.—The area of the old Reich was 181,742 sq.mi.; population 66,029,000, census of June 16, 1933. The population was distributed among the 18 "Lands" (former States) and among the chief religious denominations in 1933 as follows:

Lands	Total pop.	Evangelical	Rom. Cath.	Jews†	Others
Prussia	39,692,167	25,387,595	12,571,007	361,826	1,613,583
Bavaria	7,681,584	2,203,499	5,370,719	41,939	65,427
Saxony	5,196,652	4,522,856	196,839	20,584	456,373
Württemberg	2,666,652	1,811,797	839,678	10,023	34,826
Baden	2,412,951	943,540	1,408,532	20,617	40,262
Hamburg	1,675,703	952,381	63,538	16,973	185,555
Thuringia	1,659,510	1,485,036	44,894	2,882	126,008
Hesse	1,429,048	933,473	439,048	17,888	38,639

*Census of 1935. †Jews by religious faith; there are no census figures for Jews by blood; it was estimated that by the end of 1938 the Jews by faith had been reduced to less than 400,000.

There were (1933) 104 cities with a population of more than 50,000 each, and 567 cities and towns with more than 10,000 each. About 32.5% of the population lived in villages of less than 2,000; 10.6% in towns of between 2,000 and 5,000; and 7.3% in towns of between 5,000 and 10,000; almost half the population lived in communities of more than 10,000.

The population of the "Greater Reich," according to the census of May 17, 1939, was 79,592,000, or 86,400,000 if the "Protectorate" of Bohemia-Moravia is included. This Greater Reich was created by Hitler's annexation of the following territories: Jan. 13, 1935, Saarland, 864,000; March 13, 1938, Austria, 7,008,000; Oct. 1, 1938, Sudetenland, 2,945,000; March 15, 1939, Bohemia-Moravia, 6,805,000; March 22, 1939, Memel Territory, 153,000. In addition, by his war against Poland in Sept. 1939, Hitler added to the 86,000,000 of the Greater Reich the populations of Danzig, the Polish Corridor, Posen, and a strip of territory east of Silesia. The Poles, as far as possible, were exterminated or removed from these conquered districts and their places taken by Germans from the Reich or by tens of thousands of Germans "repatriated" from their old homes in Estonia, Latvia and Lithuania. Hitler also conquered more than half of the rest of Poland; its population of about 15,000,000 he probably hopes to organize into a puppet Polish state under German control.

History.—In Sept. 1938 Hitler declared personally to Mr. Chamberlain and publicly in a speech at Berlin that "he had no more territorial ambitions in Europe." Yet in less than a month, on Oct. 24, 1938, he secretly demanded from Poland the transfer to the Reich of Danzig (*q.v.*) and a strip of territory across the Polish Corridor to connect East Prussia with the rest of the Reich. The demand was renewed in Jan. 1939, but was neither accepted nor flatly rejected by Col. Beck, Poland's foreign minister, when he visited Hitler at Berchtesgaden to discuss the question.

On March 15, 1939, Hitler summoned Dr. Hacha, who had succeeded Dr. Benes as president of Czecho-Slovakia, to a midnight conference at Berlin. Dr. Hacha was compelled by threats of force to sign away the independence of his country and accept a German protectorate over Bohemia-Moravia. Slovakia was split off and formed into a republic, nominally independent but really under German control, because Germany acquired the right to garrison districts on the Slovakian border toward Poland and to march German troops through Slovakia. This annexation of 6,000,000 Czechs in Bohemia-Moravia, under the guise of a German protectorate, increased greatly Europe's fears of Hitler's

aggressive intentions in Eastern Europe, and showed the faithlessness of his promise after the Munich Agreement that he had no more territorial ambitions in Europe. Moreover, in annexing 6,000,000 Czechs, he was departing from his earlier statements that he was only seeking to bring into the Reich persons of German speech and culture. His pretext for annexing Bohemia-Moravia, as he declared in his Reichstag speech of April 28, was his fear that Czecho-Slovakia might become a landing place for Russian aeroplanes and thus become the spearhead by which Russian Communism would attack Western civilization.

Within a week of his annihilation of Czecho-Slovakia, Hitler demanded from Lithuania the former German territory of Memel, and annexed it on March 22, 1939. Encouraged by these successes, he renewed his demand on Poland for Danzig and a strip of territory across the Polish Corridor. The Poles, terrified by the fate which had overtaken Czecho-Slovakia and fearing that compliance would simply mean the first step in a dismemberment of Poland, at once rejected on March 26 Hitler's renewed demand. Three days later Prime Minister Chamberlain announced that Great Britain would support Poland if Poland found it necessary to fight to defend her independence and her territory. This British guarantee to Poland angered Hitler, who believed that it encouraged Poland to reject his demands and to take up a provocative attitude toward the Reich by alleged oppression of the German minorities in Poland. During the summer tension between Germany and Poland increased owing to recriminatory press attacks on both sides and owing to the increased danger of armed conflict in Danzig into which the Nazis were smuggling arms and German "tourists."

Great Britain repeatedly warned Hitler that she would live up to her promise to support Poland if Germany attacked Poland or tried to seize Danzig. Germany was warned not to make the same mistake as in 1914 of thinking that Great Britain would remain neutral in case of German aggression. But Hitler, advised by Ribbentrop, his minister of foreign affairs, appears to have thought that Great Britain could be bluffed out of supporting Poland. As a trump card in his game of bluff it was announced on August 22 that Ribbentrop was flying to Moscow to sign a German-Soviet pact of friendship. This, Hitler thought, would frighten the Poles into handing over Danzig and the Polish Corridor and would deter England from carrying out her promise to Poland. But this time Hitler grievously miscalculated. Poland and Great Britain stood firm. Therefore Hitler invaded Poland on September 1, and as a consequence found himself at war with Great Britain and France on September 3. (See EUROPEAN WAR.)

The invasion of Poland seems to have been made against the advice of Italy. It marked the weakening, or perhaps even the breaking, of the Berlin-Rome Axis. The German-Soviet pact also proved a bitter disillusionment to Hitler. It destroyed further any faith in his sincerity, because it was a complete reversal of his whole previous policy; for years he had been denouncing the Russian Communists as the worst enemies of mankind. He had repeatedly declared that it would be the greatest folly to trust them or make an alliance with them. The German-Soviet pact failed completely as the expected trump card in the game of diplomatic bluff against Poland and the Western democracies. Hitler appears to have been duped by Stalin. The Russian dictator took advantage of Hitler's war with Poland, France, and Great Britain to secure imperialist advantages for Russia: Stalin quickly invaded and annexed nearly half of Poland; he imposed treaties on Latvia, Estonia, and Lithuania giving Russia naval and aeroplane bases and military garrisons in these three little Baltic States, which were thus brought under Russian domination. Hitler had to withdraw Germans whose ancestors had been living in these countries for centuries. He thus had to abandon the old Pan-German ambition of adding them to the Reich. The Russian attack on Finland in November appeared to be a further effort to strengthen Russian power in the Baltic in case of a possible future war against Germany.

Education and Religion.—Education has gone through a drastic reorganization under Nazi rule. The period of school attendance was shortened by one year in 1937. Many new schools have been established for giving a year or two of professional or technical training; for many students this will replace the last years at the regular schools or at universities and the older technical institutes (*Hochschule*). Many schools have also been estab-

BERLIN'S BALLOON BARRAGE on a pre-war test of air-raid defences in 1939

lished for training "leaders" for the Nazi Party and for Government positions; emphasis in them is placed on comradeship, sports, Nazi ideology and leadership.

Attendance at Germany's universities has been considerably cut down since the Nazi Revolution, partly owing to Government restrictions upon attendance, partly owing to the decline in the quality of teaching as a result of the dismissal or resignation of Jewish and liberal professors, and partly owing to other causes. The Government tends to shift students from the large city universities to the smaller town universities, especially those in Eastern Germany, where Nazi influence is stronger. Thus, the figures for attendance in the winter semester of 1929-30, and the limiting quotas fixed by Bernhard Rust, the Reich minister of education, for the winter semester of 1937-38, were for the larger universities respectively: Berlin, 16,149, 6,000; Cologne, 7,162, 2,400; Frankfurt, 5,242, 1,700; Hamburg, 3,995, 1,700; Munich, 9,028, 4,800.

By the end of 1939 there was a serious shortage of school teachers, skilled engineers and members of some other professional classes.

The Evangelical Protestants and the Roman Catholics, whose numbers and distribution are given in the table on p. 313, have suffered what they regard as severe persecution under the Nazi regime. The Protestant regional churches took steps in 1933 to form a single Reich Church in accord with Hitler's general policy of centralization. But aggressive Nazis, who ordinarily seldom attended church and who indulged in semi-pagan views, mobilized their efforts to secure the election of Ludwig Mueller as Reich bishop of the new church. This caused a split, which has grown deeper and deeper, between the official Evangelical Church and the really devout Christian Opposition pastors and their followers led by Dr. Martin Niemöller.

Pope Pius XI signed with Hitler in 1933 a Concordat guaranteeing to the Roman Catholics the free exercise of their religion, their religious schools, and their various religious youth, professional and charitable organizations. The guarantees have not been observed. There was much fear among Roman Catholics at the end of 1938 that, after the Jews had been mulcted by the 1,000,000,000-mark fine, the Nazis would soon make a great capital levy upon Roman Catholic property.

GERMANY: Industrial production index (*The Annalist*)

Finances and Banking.—No exact statement can be made in regard to the German Government's revenues and expenditures, as the budget has not been published since 1935. The taxes by the Central Government have nearly quadrupled since Hitler came to power, being about 6,000,000,000 marks for 1932-33, 11,500,000,000 for the fiscal year ending March 31, 1937, and estimated at roughly 22,000,000,000 for the year ending March 31, 1940. This does not include taxes of about 4,000,000,000 marks levied by the Lands and local communities (*Gemeinde*). The exact debt is also unknown, because the large amounts of Treasury bills issued to build armaments, auto highways and other public works, and to provide for the unemployed, are not counted in the debt until they fall due. Between 1935 and Jan. 1939, the Government publicly increased the Reich debt by issuing 13 long-term loans totalling over 15,000,000,000 marks, in order to take care of the Treasury bills as they fell due and to consolidate the short-term indebtedness. These loans all bore 4½% interest, were issued at 98½, and were quoted in Jan. 1939 at a fraction above the issue price. They do not include two 500,000,000-mark loans issued by the State railway (*Reichsbahn*) in 1936 and in 1939, nor loans by other Government enterprises. The total debt of the Reich in Jan. 1940 was conservatively estimated at more than 75,000,000,000 marks or \$30,000,000,000—approximately the same per capita debt as in the U.S. on the same date.

The Reichsbank's gold and foreign exchange reserves, which were about 4,000,000,000 marks in 1932, had shrunk to 70,000,000 at the end of 1939, and afforded only a 0.7% coverage for paper money, as compared with 24.7% in 1932 and with the 40% which before the World War (1914-18) was considered the lowest coverage compatible with safety. The standard of currency is the German mark, equivalent in U.S. money to 40.3325 cents. Owing to the Government's rigid control, its official exchange value is kept very close to its American and foreign equivalent.

Trade and Communication.—Since 1935 Germany's exports and imports have been very strictly controlled, first by Dr. Schacht's "new system," and then by Goering's dictatorial economic power as commissioner for the Four-Year Plan. Germany's imports and exports, and resulting balance of trade during the years 1932-39 were:

	Total Yearly			Monthly Average		
	Imports Million marks	Exports Million marks	Balance Million marks	Imports Million marks	Exports Million marks	Balance Million marks
1932 . . .	4,667	5,739	+ 1,072	380	478	+ 89
1933 . . .	4,204	4,871	+ 667	350	406	+ 56
1934 . . .	4,451	4,167	- 284	371	347	- 24
1935 . . .	4,150	4,270	+ 111	347	356	+ 9
1936 . . .	4,218	4,768	+ 550	352	397	+ 46
1937 . . .	5,468	5,911	+ 443	454	493	+ 37
1938* . . .	6,052	5,620	- 432	504	468	- 36
1939† . . .	2,755	2,814	+ 59	458	468	+ 10

*Figures do not include Austria and Sudeten area.
†Figures are for the first six months of 1939 only.

The above figures show that the imports tend to increase, especially in 1937 and 1938, while the exports increase less, with the result that the balance of trade becomes less favourable. Among the reasons for this is the fact that Germany has increased her imports of raw materials for her rapidly growing armaments, and to some extent her imports of food for her people and fodder for her cattle. The figures do not include the exports and imports of the annexed Austrian and Sudeten territories. If they did so, the deficit in the trade balance would have been greater in 1938, since Austria and the Sudeten territories have always had to import a larger proportion of their food than has Germany; as far as Germany's food problem goes, these two territories are a liability rather than an asset to Germany. This is partly indicated by the fact that the trade balance deficit in August, September,

DISABLED PLANE photographed by Germans during their raid on the Firth of Forth Oct. 16, 1939; the Nazis claimed the plane was British

October, November in 1938 is shown by the following figures to be much greater for "Greater Germany," than those for the old Reich which are given in parentheses for each successive month: Greater Germany, -64 million marks (old Reich, -37 million marks); -50 (-34); -36 (-9); -69 (-33). The trade balance deficit was also much greater in the later months of the year than the monthly average for the whole year (-36). Here, then, is one of Germany's most serious problems for the future. If deficit in the trade balance continues to increase, as seems likely, it means that Germany is losing more and more of her foreign exchange, or more and more of her tiny gold supply, and will therefore be less able to buy food for her people and raw materials for her armaments and industries. And if she cannot get raw materials for her industries she will be less and less able to send out exports, which in turn will still further increase the deficit in the trade balance.

Another factor in the deficit in the trade balance, especially for the month of Nov. 1938, was probably the tightening of the foreign boycott against German goods as a result of the attacks upon

THE BRITISH CRUISER "EDINBURGH" photographed from a German plane above Rosyth naval base on the Firth of Forth after the ship was bombed during the raid of Oct. 16, 1939

ADOLF HITLER reviewing battered members of the Nazi corps in Prague after proclaiming the German protectorate over Bohemia Mar. 16, 1939

Jewish synagogues and stores and the arrest of thousands of Jews which began on November 10. This was alleged by Dr. Goebbels to be the result of "the justified and understandable anger of the German people over the cowardly Jewish murder of a German diplomat in Paris," but was in fact organized by some of the more radical Nazi authorities. The murder of Ernst vom Rath, a secretary in the German embassy at Paris, by the young Polish Jew, Grynspan, was speedily but illogically made the excuse for levying a gigantic fine of 1,000,000,000 marks upon the Jews of Germany. In this way the Nazis hoped to offset some of the deficit in their foreign trade balance and to acquire eventually some very much needed foreign exchange. But with the outbreak of war in Sept. 1939 the British blockade cut off more than 40% of Germany's overseas trade. The exact figures are not available because with the outbreak of war Germany ceased the monthly publication of her trade statistics.

The German State railway (*Reichsbahn*) included in 1935, 53,330km. (33,076mi.) of standard gauge lines and 879km. (546mi.) of narrow gauge lines. Privately owned lines were 3,732km. (2,313mi.) of standard and 752km. (476mi.) of narrow gauge. Owing to Hitler's great efforts for the rapid completion of a line of fortifications on the western frontier against France during the summer of 1938, on which 500,000 men were employed and on which vast quantities of cement and steel were employed, the railways were somewhat neglected. There were many complaints toward the end of 1939 that trains were late and were unable to handle freight promptly.

In 1939 the disruption of train schedules led during the latter part of the year to a series of disastrous wrecks.

German inland shipping in 1937 included 5,375 vessels moving under their own power and totalling 528,000 tons; and 12,488 canal boats and other vessels without power, totalling 5,835,000 tons. High-seas shipping included 3,579 vessels with a total registered net tonnage of 2,238,000. In 1938, as a result of the year-long trial of Arnold Bernstein for alleged evasion of German foreign exchange laws, his two lines, the Bernstein and Red Star Lines, passed under German control.

By the end of 1938 Germany had completed the construction of 3,000km. (1,864mi.) of the new automobile highway network (*Reichsautobahn*). This completes about half of the highways

projected. They are magnificent concrete two-way roads, separated by a grass strip, and without any crossings; intersecting roads use bridges or underpasses. The highways have regard for scenic beauty, and are of great economic and strategic importance. They have cost nearly 3,000,000,000 marks (nearly \$1,200,000,000), and have given employment to 250,000 workers, half directly and half indirectly.

Agriculture, Manufactures, Mineral Production.—Germany's grain harvests were medium or poor in 1936 and 1937, causing some food and fodder shortage. This was partly offset by the 1937 potato crop, which reached an all-time high record, and by the grain harvest of 1938 which was exceptionally good. Latest available figures for principal crops in thousands of metric tons are:

	Rye	Wheat	Barley	Oats	Potatoes	Sugar-Beets	Fodder Beets
1932 . . .	8,363	5,003	3,214	6,650	47,016	7,875	34,486
1933 . . .	8,727	5,604	3,468	6,052	44,071	8,578	30,716
1934 . . .	7,607	4,532	3,203	5,452	40,780	10,304	33,804
1935 . . .	7,478	4,667	3,387	5,385	41,015	10,567	34,711
1936 . . .	7,386	4,426	3,399	5,618	46,323	12,005	37,826
1937 . . .	6,020	4,580	3,640	5,020	53,000	15,701	40,538
1938 . . .	8,463	5,502	4,177	6,274	48,700	17,200	41,700
1939* . . .	—	—	—	—	54,540	17,400	39,500

*Figures for 1939 are estimated. The total grain harvest was estimated at 27,430,000 metric tons, i.e., 6.4% more than the total for 1938.

Owing to Germany's lack of gold and foreign exchange with which to buy raw materials, Hitler established in 1936 the Four-Year Plan. Its purpose is to develop Germany's own resources and furnish substitutes for goods and raw materials formerly imported. The "Hermann Goering Reich Stock Company for Ore Mining and Iron Smelting" for the mining of low grade iron ore in the Salzgitter district in Central Germany near Hanover was expected to produce 1,000,000 tons of crude steel by 1940 when the plant is completed. Synthetic gasoline, rubber, soap, textiles partly of wood products, and other substitute (*Ersatz*) products are already being successfully developed, but at a high cost; they demand much labour and invested capital furnished in part by the State, and threaten the ultimate exhaustion of Germany's forest and mineral resources. They have caused such a shortage of labour that it is estimated that 60% of Germany's industrial workers now have to work 12 (and in some cases 14) instead of 8 hours a day. Germany's principal mineral and manufactured products were as follows in metric tons:

	1933	1934	1935	1936	1937
Coal . . .	109,532,600	125,405,600	143,491,300	159,756,600	184,500,000
Lignite . . .	126,756,600	137,223,400	147,162,100	161,426,900	184,700,000
Iron Ore . . .	2,592,000	4,343,000	6,044,000	7,570,000	9,792,000
Lead . . .	91,000	98,400	122,300	139,000	158,500
Zinc . . .	162,000	212,800	205,000	207,700	194,300
Rock salt . . .	1,841,300	2,024,200	2,077,200	2,383,800	2,767,000
Potash . . .	7,362,800	9,616,700	11,672,500	11,764,600	14,460,000
Pig iron . . .	5,246,500	8,716,700	12,846,200	15,302,500	15,960,000
Steel . . .	7,393,200	11,601,700	16,013,500	18,590,900	19,387,000

Ghazi Ibn Feisal (1912–1939), King of Iraq, was born on March 21, at Mecca and succeeded to the throne as Gbazi I on Sept. 9, 1933, following the death of Feisal I, his father, in Switzerland. He was educated at Harrow and the Royal Iraqi Military college. His reign was marked by periodic internal disorders and by his promotion of large-scale projects to modernize the kingdom. A revolt in 1935 was suppressed by the youthful ruler, but in October of the following year a sudden coup d'état, preceded by the assassination of the minister of defence, placed Gen. Baqir Sidqi in political control. Sidqi was himself assassinated in Aug. 1937, and the unrest continued. Ghazi's treaty of alliance with King Ibn Saud of Saudi Arabia was a notable step toward Pan-Arab unity in the Near East but did not prevent the king from maintaining cordial relationships with France and Great Britain. Gbazi was married on Sept. 19, 1933 to his cousin Aaliah, the daughter of the late King Ali of the Hejaz. His son, born May 2, 1935, became King Feisal II under a regency when Ghazi died April 4 after a motor car accident near the royal palace in Baghdad. A rumour that Ghazi had been murdered by British citizens caused the assassination of the British consul in Mosul the same day.

Gibbons, Floyd (Phillips) (1887–1939), American journalist and war correspondent, was born at Washington, D.C., on July 16 and was educated at Gonzaga college and Georgetown university. His first reportorial assignment was with *The Minneapolis Daily News* in 1907. Later he worked for *The Milwaukee Free Press* and *The Minneapolis Tribune*. In 1912 he joined the staff of *The Chicago Tribune*, where he received considerable attention for his reporting of the Villa revolution in Mexico. He was aboard the British liner "Laconia" when it was torpedoed off the coast of Ireland Feb. 25, 1917, and reported the disaster in a lengthy dispatch. After America's entry into the World War, he was appointed war correspondent for the *Tribune* on the western front; during the battle of Château-Thierry he was seriously wounded and lost the sight of one eye. After the war he was "roving" correspondent in Russia. He also covered the Japanese conquest of Manchuria and the Italo-Ethiopian war of 1935–36. Gibbons was preparing to leave for France as a war correspondent when he died September 24 in his home at Saylorsburg, Pennsylvania. Among his published works are *The Red Knight of Germany* (1927) and *The Red Napoleon* (1929).

Gilbert, Prentiss Bailey (1883–1939), U.S. diplomat, was born in Rochester, N.Y., on October 3 and was educated at the University of Rochester and at Yale, Columbia, and the Colejio de San Carlos at Cebu in the Philippines. He was a special aide in the Philippines during the Spanish-American war and was promoted from first lieutenant to major, General Staff, during the World War. In 1919 he was appointed chief of the U.S. Division of Political and Economic Intelligence. He became chief of the division of Western European affairs in the Department of State in 1924. He was first secretary of the American embassy in Paris in 1930, U.S. consul at Geneva from 1930 to 1937, and counsellor to the embassy in Berlin from 1937 until his death. After the recall of Ambassador Hugh R. Wilson on Nov. 14, 1938, Gilbert was the ranking American diplomat in Germany. He died in Berlin February 24.

Gilman, Lawrence (1878–1939), U.S. critic and author, was born at Flushing, N.Y., on July 5. See *Encyclopædia Britannica*, vol. 10, p. 356, for his biography and a list of his principal works. Since 1923 he had been music critic of *The New York Herald-Tribune*, and from 1933 to 1936 he was radio commentator for the Sunday broadcasts of the New York Philharmonic-Symphony concerts. He died at Sugar Hill, N.H., on September 9.

Girl Scouts, a voluntary leisure-time organization in the United States for girls from seven to eighteen years old: Its program offers activities in the fields of homemaking, nature, out-of-doors, community life, international friendship, dramatics and literature, arts and crafts, music and dancing, health and safety, sports and games. It is adapted to girls of various ages: the Brownie program is for girls from seven to ten

000 oz. in 1938. The lowering of the average grade of ore treated, which dropped from 0.2253 oz. per ton in Jan. 1938 to 0.2051 oz. in Jan. 1939, did not continue in 1939, but rose to 0.2073 oz. in September.

The Soviet Union has definitely taken second place, but the actual magnitude of the output is a matter of pure conjecture, with opinions varying within wide limits. However, there now seems to be pretty general agreement that the Russian output has been declining since 1935.

The United States held third place with a 1937 total of 5,148,000 oz. (including the Philippines), or 4,245,000 oz. for the United States alone. Production for 1939, including the Philippines, was 5,600,000 oz., an increase of 8% over 1938 and 4,600,000 oz. for continental United States.

Canada in 1938 stood fourth, with an output of 4,725,000 oz. and an increase of 15% over 1937. There was a smaller advance in production rate in 1939, the total for the year being estimated at 5,046,000 oz., an increase of 7%. This placed Canada in an intermediate position, fourth in rank, after the United States including the Philippines, but third, ahead of the United States, as compared with it alone.

The only other individual producer having an output in excess of 1,000,000 oz. was Australia, with 1,593,000 oz. in 1938. The Japanese Empire had an estimated output of about 1,768,000 oz. in 1938, from Japan proper, Chosen (Korea), and Taiwan (Formosa), an increase of 19% over 1937.

The British Empire in 1937 produced from 29 separate units, a total of 21,240,000 oz. of gold, 57% of the world total. The three leading countries, South Africa, Canada, and Australia, all with outputs exceeding 1,000,000 oz., contributed 57%, 22% and 7.5% respectively.

Intermediate producers, with outputs in excess of 100,000 oz. were: Southern Rhodesia 4%, Gold Coast 3%, India 2%, and New Guinea and New Zealand 1% each; 2% is divided among the various minor producers.

The price of gold in London rose steadily from 150s.0½d. on Jan. 2, 1939, to 160s. on September 1. With the outbreak of war with Germany, the price was fixed at 168s. on September 5, and this was maintained to the end of the year, with dealings in gold prohibited except through official channels, and the requirement that all coin or bullion be sold to the Government. (See also FEDERAL RESERVE SYSTEM; GOLD RESERVES AND GOLD STANDARD; MINERAL AND METAL PRICES AND PRODUCTION.) (G. A. Ro.)

Gold Reserves and Gold Standard. The coming of war in Europe in 1939 compelled much of the world to make over its economy from a peacetime to a wartime basis. In this transition, which affected the belligerents most noticeably but did not permit the neutral nations to escape, the status of gold was likewise modified. In peace the main reliance of the world as a backing for currency, a curb on credit inflation and a means of settling international balances, gold became in war a mighty sinew of national defence.

Up to the outbreak of war the record of gold in world affairs in 1939 was very largely a repetition of its performance in 1938. Gold moved westward across the Atlantic in a swollen flood as private capital fled from those nations which might lie in the path of war. Included also in this gold in flight were substantial portions of the official gold reserves of several countries in

Europe, which sought, on the one hand, to place their gold beyond reach of sudden seizure and, on the other, to build up a reserve of purchasing power in the United States, which was in the World War (1914-18) a granary and machine-shop for Europe, and might be again.

Once the war had descended upon Europe, however, England, the point of origin of the bulk of the gold shipments to the United States, and its ally, France, invoked regulations promptly to deprive capital of its freedom of movement. They adopted exchange restrictions even more severe than those found necessary in the war of 1914-18 and without precedent in recent years except in the totalitarian countries. They frankly stripped gold of its remaining attributes as a currency reserve and made of it a material of war. For them gold was no longer an instrument for minimizing currency fluctuations. It became for them the solidest asset in their war chest, to be drawn on only to pay for goods required in winning the war and preserving their national existence. It was noted in 1938 that gold was coming to be regarded in Europe "as a prime requisite of national defence." So it proved at once after the German tanks, planes, and troops crossed the Polish border in the early morning hours of September 1 and the evil day which Europe had so long dreaded was at hand.

There were two major movements of gold in 1939 prior to the onset of war. The first of these came in March 1939, following the completion by Germany of the task, begun in the preceding September, of dismembering Czecho-Slovakia. Four major movements of gold took place in the 18 months before Germany set upon Poland. The first was in March 1938, when Germany stripped Austria of its independence. The second came in Sept. 1938, in the anxious weeks which preceded the Munich settlement. The third got under way in March 1939, after Germany tore Czecho-Slovakia asunder, taking half for itself and tolerating in the other half the establishment of a State subservient to the Reich.

The outpouring of gold from Europe to the United States in the spring of 1939, though, was somewhat different from the two major movements which preceded it in 1938. For in the spring of 1939 several of the neutral European nations, observing how Germany swooped down upon Czecho-Slovakia and seized its gold as well as its lands, began to move a substantial part of their gold reserves to the United States for safekeeping. They hoped thus to put their reserves of the metal beyond the grasp of a neighbour whose thirst for gold was second only to his hunger for territory. Switzerland, Sweden, Norway, Belgium, and Holland—small States all, whose defences might be overwhelmed by a sudden attack—moved great quantities of their official holdings of gold to the United States and placed it under earmark at the Federal Reserve Bank

GOLD PRODUCTION: world total and output of the principal producing countries (*The Mineral Industry*)

A RECORD SHIPMENT of gold, \$60,000,000 in bullion, arrived in New York city Mar. 31, 1939

of New York. The amount of gold under earmark for foreign account in the United States increased by \$114,800,000 in April, \$251,600,000 in May, \$102,600,000 in June and \$166,200,000 in July, reaching at the end of the last-named month the highest total on record at \$1,287,000,000.

Thus Governments competed with their nationals for space for gold in steamships departing from Europe for New York. Where the net additions to the earmarked gold stock in the United States in Aug., Sept. and Oct. 1938, amounted to \$152,300,000, in the four months ended July 1939, such net additions totalled \$635,200,000. Gold imported into the United States in Sept. and Oct. 1938, at the time of the Munich crisis, was valued at \$1,083,000,000, most of it arriving from Europe. The spring crisis of 1939 brought \$1,400,600,000 of gold to the United States, and in the two months preceding, and the first month subsequent to, the German invasion of Poland the net gold imports amounted to \$1,105,000,000. Included in the 1939 import figures was \$165,122,000 of Belgian gold, \$301,311,000 of Netherlands gold, and \$78,946,000 of Swiss gold.

The statistics on capital movements compiled by the United States Treasury showed that \$1,086,100,000 net of foreign capital was received in the United States from Dec. 28, 1938, to Aug. 30, 1939, of which \$657,400,000 came from Europe. European Governments viewed with tolerance, if not actually with approval, this massing of the capital of their nationals in the United States. Subsequent events made it clear that European Governments were preparing to appropriate the liquid dollar resources of their nationals, if war should come. The cash-and-carry provision of the United States neutrality act closed the door to belligerent credits and plated a premium thereby on gold and cash resources in the United States, if resort was to be had in wartime to the materials and machines which the United States could supply.

When war came, there was for gold a sudden break with the past. The United Kingdom, the British Empire countries, and

France imposed strict foreign exchange regulations and forbade the export of gold except by licence. On Sept. 6, 1939, the Bank of England transferred \$1,162,000,000 of gold—its entire holding, except for a nominal amount—to the Exchange Equalization Account. Official prices were fixed for sterling, as for the French franc. In fact, not a country remained at the close of 1939, save perhaps the United States, of which it could be said with confidence that its gold would be used without stint to support its currency. The estate of gold had not been lower in modern times, for even in the World War the belligerents used gold to keep their exchanges steady.

The acknowledged gold reserves of the 52 leading nations, according to Federal Reserve Board calculations, declined from \$25,468,000,000 in Dec. 1938 to \$25,277,000,000 at the close of Oct. 1939. Omitted from the latter total, however, were the gold holdings of the European stabilization funds. Gold resources of the British Exchange Equalization Account were reckoned at \$2,000,000,000, while the French stabilization fund owned \$477,000,000 of gold in May 1939, in addition to the \$2,714,000,000 of gold in the Bank of France. Gold production continued to expand and in the first nine months of 1939 amounted to \$893,000,000, exclusive of the Soviet Russian output, a record high. The monthly average output in this period was \$99,170,000, against \$94,170,000 in 1938. In 1929, before the round of currency depreciations and gold revaluations, gold production was valued at \$383,000,000.

The table below sets forth the changes in value of the lead-

Currency	1929	1933	1938	Oct., 1939
Argentine peso	95.127	72.801	32.507	29.770
Belga	13.912	17.000	16.804	16.720
Milreis	11.8072	7.0630	5.8438	6.0575
Canadian dollar	99.247	91.959	99.419	89.331
French franc	3.9161	5.0313	2.8781	2.2736
Lira	5.2334	6.7094	5.2605	5.0465
Yen	46.100	25.646	28.451	23.510
Guilder	40.162	51.721	55.009	53.115
Swedish krona	26.784	22.032	25.197	23.792
Swiss franc	19.279	24.836	22.871	22.433
Pound sterling	485.69	423.68	488.94	401.05

ing currencies in recent years vis-a-vis the United States dollar.

The Scandinavian nations and Japan dissociated their currencies from the sterling group after the outbreak of war and affixed the pegs for their units to the United States dollar. (See also AGRICULTURE; EXCHANGE RATES; FINANCIAL REVIEW; GOLD.)

(E. H. Co.)

Gold Standard: see GOLD RESERVES AND GOLD STANDARD.

Golf. There was little abatement of golf interest in the United States in 1939. Tournaments were well patronized, club membership rosters throughout the country maintained the general high level of the previous year and daily fee courses generally reported increased revenue and activity.

There was an apparent moratorium on controversial rules questions. The United States Golf Association failed, despite contrary predictions, to abolish the varied collection of heavy-soled niblicks. Nor was an attempt made to limit the weight of these clubs. The stymie rule as amended and adopted in January seemed to wear well with tournament players.

The golfer of the year was Marvin (Bud) Ward of Seattle, Wash., who won the Amateur title and came within a stroke of tying for Open title. In the Open championship, played over the Philadelphia Country Club course, Ward was one of a half-dozen contestants with an excellent chance of winning as the final round started.

On the par 3 eleventh and thirteenth holes Ward scored "fives." Despite tossing away four strokes to par on these holes he finished one stroke behind Byron Nelson, Craig Wood and Denny Shute, who tied at 284 and were obliged to play off for the title Ralph Guldahl had relinquished after winning two successive years.

In the first 18-hole replay Wood and Nelson played sensationally, once again tying. Their scores of 68 necessitated another play-off. This time Nelson became champion, getting off to a brilliant start with a birdie on the third hole and an eagle on the fourth where he holed out a shot with a driving iron.

The disappointment of the championship was Sam Snead who had set a record in 1938 by winning \$20,000 in purses. Snead, the public favourite, faltered on the final hole of the 72-hole test and shattered his hopes with an 8 on the par 5 hole.

The Amateur championship was one of recurring surprises. Tom Sheehan of Michigan established a record in winning the qualifying medal with 138 at North Shore. He was defeated in the first match play round by an obscure player.

Ward, who was obliged to sink a 25-ft. putt on the nineteenth green of his first round match with Eddie Held to keep from being eliminated, won on the next green and then went on to defeat Raymond Billows, 1937 runner up, 7 and 5 in the final. Ward's putting was phenomenal. In the 66 holes required for him to defeat Arthur Doering of Chicago in the semi-final and Billows in the final, the Pacific Northwest player used a single putt on 27 greens.

The United States women's championship opened with a flourish of foreign invaders but terminated with two youthful Americans in the final. Pamela Barton, who had regained the British championship earlier in the year, was favoured to win the American title at Wee Burn. She was defeated in an extra hole quarter-finals match by Charlotte Glutting, member of the last three Curtis Cup teams. Miss Glutting herself was beaten in the following round, losing on the nineteenth green to Dorothy Kirby after being two up with three to play. Miss Kirby lost in the final to Betty Jameson of San Antonio, Tex. Fay Crocker, South American champion from Montevideo, shared favouritism with Miss Barton. She was defeated in an extra hole match by 18-year old Elizabeth Hicks of California, the "find" of the tournament.

Patty Berg of Minneapolis was unable to defend her championship. The youthful Minnesotan was stricken with appendicitis less

than a fortnight before the championship.

The stormiest session to occur at a tournament all year was precipitated by Denny Shute in the Professional Golfers Association championship at Pomonok, Flushing, L.I. Shute, exempt from sectional qualifying for the championship because of his Ryder Cup team status, neglected to forward his annual subscription on time to the association secretary. This was held by the P.G.A. executive committee to be sufficient grounds for disqualification.

George Jacobus, P.G.A. president, over-ruled his executive committee and ordered the tournament to be continued with Shute as a competitor. The tournament was concluded after the qualifying round had been interrupted for almost two hours. Scoring over the comparatively short course was consistently below par. Henry Picard and Byron Nelson survived the par shattering and engaged in a thrilling 36-hole final match. Nelson scored 67 both morning and afternoon but could not gain an inch. On the 37th hole Picard sank a 7-ft. putt for a birdie and won the title when Nelson missed a 5-ft. putt. It was Picard's first triumph in a major championship. Apart from winning the P.G.A. title Picard was the largest money winner during 1939, although his total was slightly more than one-half of Snead's \$20,000 in 1938. Ralph Guldahl and Dick Metz were close behind.

The Professional Golfers Association nominated a team to compete for the Ryder Cup although it already had been notified by the British P.G.A. that the war situation in Europe made it impossible to send over a team to compete in the biennial matches which were to be held at Ponte Vedra, Florida. The team personnel were Picard, Nelson, Guldahl, Metz, Snead, Harold McSpaden, Horton Smith, Paul Runyan, Victor Ghezzi and Jimmy Hines. Ben Hogan, Shute, E. J. Harrison and Wood, all of whom had higher standings in the Harry Vardon Memorial trophy ratings, were ignored by the P.G.A.

Most of the championships had been decided in Europe before war beclouded the continent. Although he failed to win the British title, Henry Cotton, who had been appointed captain of the Ryder Cup team, became a magnet for galleries as he toured British courses playing exhibition matches to raise Red Cross funds. Ironically, Cotton won the 1939 German Open Championship. Miss Barton hastened home from the United States women's championship to don a uniform and drive an ambulance. The British Open turned up a surprise winner in Richard Burton, but not until after three hours of anxious waiting.

John Bulla, a little known American professional, who made a brief splurge in the U.S. championship at Philadelphia, finished the 72-hole test with a score of 272. The weather on the final day was inclement at historic St. Andrews and one by one the British players came in with higher scores than Bulla who was playing in the tournament for the first time. One of the last to finish, Burton posted a courageous 71 to snatch the title from the giant American.

James Bruen, 19-year old Irish amateur, was the cynosure of all eyes after he scored two 69s in the qualifying round. Bruen failed to hold the pace and finished in a tie with Cotton at 298, eight strokes behind the victor. Bruen also proved a disappointing surprise in the British and Irish Amateur and the Irish Open championships. He reached the semi-final of the British Amateur. That title was won by Andrew Kyle. The Irish Open was won by Arthur Lees and in the Irish Amateur Bruen was defeated 3 and 1 by Gerry Owens. Bill Holt of Syracuse, N.Y. and Richard Chapman of Greenwich, Conn., proved the chief American threats in the British Amateur. Chapman was vanquished in the quarter-final and Holt in the semi-final. Chapman later won the French Amateur championship.

Jimmy Adams, who engaged in Red Cross exhibition matches with Cotton, won the Scotch Open and Hamilton McNally ac-

quired the Scotch Amateur title. Jessie Anderson, British champion in 1937 and a member of the 1938 Curtis Cup team, won the Scottish ladies' championship.

Goodnow, Frank Johnson (1859-1939), U.S. educator, was born in Brooklyn on January 18. He was educated at Amherst and Columbia, and later studied in Paris and Berlin. From 1883 to 1907 he taught history and administrative law at Columbia. He was legal adviser to the Chinese Gov't in 1913 and 1914, and president of Johns Hopkins university from 1914 to 1929. Dr. Goodnow, who was author of many volumes on legal and political subjects, died at Baltimore. November 14.

Gordon, Sir Charles Blair (1867-1939), Canadian banker and industrialist, was born at Montreal on November 22 and was educated at the high school there. After a brief period in private employment he organized his own firm which later became, through a series of mergers, the Canadian Converters company. He was president of the Bank of Montreal from 1927 until his death and was a director of numerous textile, glass, mining, banking, and public utilities companies, also of the Canadian Pacific railway. He died at Montreal July 30.

Gort, John Standish Surtees Prendergast

Vereker, 6TH VISCOUNT (1886-), British soldier, was born in July 1886, son of the 5th viscount, whom he succeeded in 1902. He was educated at Harrow and Sandhurst, and joined the Grenadier Guards as second lieutenant in 1905. In 1913 he was appointed aide-de-camp to the general officer commanding the London district, and at the start of the World War (1914-18) he was in the first contingent that went to France. He served throughout the war, sometimes on the staff and then on regimental duty; he was wounded four times, mentioned in dispatches nine times, and received the Victoria cross, the Military cross, and the Distinguished Service Order with two bars. He was an instructor in the army staff college from 1921 to 1923 and in 1926 became chief instructor at the senior officers' school. In Jan. 1927 he was appointed general staff officer of the Shanghai defence force and later held a similar appointment in the 4th division of the army. In 1930 he was appointed commander of the Grenadier Guards, and from 1932 until early in 1936 he was in India as director of military training. He had been promoted to major-general in Nov. 1935, and in Sept. 1937 he was appointed military secretary to the secretary of War, with the local rank of lieutenant-general. On Dec. 2, 1937 he received his appointment as chief of the British Imperial general staff, and in 1939 he led the British expeditionary forces again to French soil, after his appointment September 3 as commander-in-chief of the British field forces, with the Duke of Gloucester as his chief liaison officer.

Government Departments and Bureaus.

The following are the leading officers of the more important Government departments and bureaus of the United States. The date for the information is Jan. 15, 1940.

Department or Bureau	Name	Post
Department of State	Hull, Cordell	Secretary
	Welles, Sumner	Under-Sec'y
Department of the Treasury	Morgenthau, Henry, Jr.	Secretary
	Bell, Daniel W.	Under-Sec'y
Comptroller of the Currency	Delano, Preston	Comptroller
Treasurer of the U. S.	Julian, William A.	Treasurer

Department or Bureau	Name	Post
Bureau of Customs	Harris, Basil	Commissioner
Bureau of Internal Revenue	Helvering, Guy T.	Commissioner
Federal Alcohol Administration	Alexander, W. S.	Administrator
*The Coast Guard	Waesche, Russell R.	Commandant
Department of War	Woodring, Harry H.	Secretary
	Johnson, Louis A.	Asst. Sec.
Chief of Staff	Marshall, George C.	Chief of Staff
Adjutant General	Adams, Emory S.	Adj. General
Chief of Engineers	Schley, Julian L.	Chief
Chief of the Air Corps	Arnold, Henry H.	Chief
Department of Justice	Jackson, Robert H.	Att'y-Gen.
Solicitor General	Biddle, Francis J.	Solic. Gen.
*Federal Bureau of Investigation	Hoover, J. Edgar	Director
Bureau of Prisons	Bennett, James V.	Director
*Post Office Department	Farley, James A.	Post. Gen.
Department of the Navy	Edison, Charles	Secretary
Office of Naval Operations	Stark, H. R.	Chief
Bureau of Navigation	Nimitz, C. W.	Chief
General Board	Sexton, W. R.	Chairman
*Marine Corps	Holcomb, Thomas	Commandant
Department of the Interior	Ickes, Harold L.	Secretary
	Wirtz, Alvin J.	Under-Sec'y
General Land Office	Johnson, Fred W.	Commissioner
Office of Indian Affairs	Collier, John	Commissioner
Geological Survey	Mendenhall, W. C.	Director
*Bureau of Biological Survey	Gabrielson, Ira N.	Chief
Bureau of Reclamation	Page, John C.	Commissioner
Bureau of Fisheries	Jackson, Charles E.	Acting Commissioner
National Park Service	Cammerer, Arno B.	Director
Bureau of Mines	Finch, John W. (resigned)	Director
Department of Agriculture	Wallace, Henry A.	Secretary
	Wilson, M. L.	Under-Sec'y
Agricultural Adjustment Administration	Evans, R. M.	Administrator
*Bureau of Agricultural Chemistry and Engineering	Knight, Henry G.	Chief
Bureau of Agricultural Economics	Tolley, Howard R.	Chief
Bureau of Animal Industry	Mohler, John R.	Chief
Commodity Credit Corporation	Robbins, Carl B.	President
Bureau of Entomology	Strong, Lee A.	Chief
Farm Credit Administration	Black, Albert G.	Acting Gov.
Food and Drug Administration	Campbell, Walter G.	Chief
Forest Service	Granger, C. M.	Acting Chief
Bureau of Home Economics	Stanley, Louise	Chief
Bureau of Plant Industry	Auchter, E. C.	Chief
Rural Electrification Administration	Slattery, Harry	Administrator
Soil Conservation Service	Bennett, Hugh H.	Chief
Weather Bureau	Reichelderfer, F. W.	Chief
Department of Commerce	Hopkins, Harry L.	Secretary
	Noble, E. J.	Under-Sec'y
Bureau of the Census	Austin, William L.	Director
Bureau of Foreign and Domestic Commerce	Young, J. W.	Director
*National Bureau of Standards	Briggs, Lyman J.	Director
Coast and Geodetic Survey	Colbert, Leo O.	Director
Bureau of Marine Inspection and Navigation	Field, R. S.	Director
Patent Office	Coe, Conway P.	Commissioner
Department of Labor	Perkins, Frances	Secretary
	McLaughlin, C. V.	Asst. Sec'y
United States Conciliation Service	Steelman, J. R.	Director
Bureau of Labor Statistics	Lubin, Isador	Commissioner
Immigration and Naturalization Service	Loughteling, James L.	Commissioner
Children's Bureau	Lenroot, Katharine F.	Chief
Women's Bureau	Anderson, Mary	Director
Wage and Hour Division	Jacobs, Harold D.	Acting Administrator
Independent Offices		
*Civil Service Commission	Mitchell, Harry B.	President
Interstate Commerce Commission	Eastman, Joseph B.	Chairman
*Federal Reserve System Board	Eccles, Marriner S.	Chairman
Federal Trade Commission	Davis, E. L.	Chairman
United States Tariff Commission	Stevens, Raymond B.	Chairman
United States Board of Tax Appeals	Arundell, C. R.	Chairman
Federal Power Commission	Olds, Leland	Chairman
*Veterans' Administration	Hines, Frank T.	Administrator
*Smithsonian Institution	Abbot, C. G.	Secretary
*Pan American Union	Rowe, L. S.	Director Gen.
*American National Red Cross	Davis, Norman H.	Chairman
*Tennessee Valley Authority	Morgan, Harcourt A.	Chairman
Federal Deposit Insurance Corporation	Crowley, Leo T.	Chairman
Securities and Exchange Commission	Frank, Jerome N.	Chairman
The National Archives	Connor, R. D. W.	Archivist
National Labor Relations Board	Madden, J. Warren	Chairman
Federal Communications Commission	Fly, James L.	Chairman
*Government Printing Office	Giegengack, A. E.	Public Printer
Civil Aeronautics Authority	Hinckley, Robert H.	Chairman
Air Safety Board	Hardin, Thomas	Chairman
United States Maritime Commission	Land, Emory S.	Chairman
Maritime Labor Board	Bruere, Robert W.	Chairman

Department or Bureau	Name	Post	Department or Bureau	Name	Post
Federal Security Agency	McNutt, Paul V.	Administrator	Patent Office	M. F. Lindley	Comptroller-general
Civilian Conservation Corps	McEntee, J. J.	Acting Director	Paymaster General's Office	Earl Winterton	Paymaster-general
National Youth Administration	Williams, Aubrey	Administrator	Pensions, Ministry of	Sir Walter Womersley	Minister
Office of Education	Studebaker, John W.	Commissioner		Sir Adair Hore	Permanent Secretary
*Public Health Service	Parran, Thomas, Jr.	Surgeon Gen.	Post Office	Maj. G. C. Tryon	Postmaster-general
Social Security Board	Altmeyer, Arthur J.	Chairman		Sir Thomas Gardiner	Director-general
Federal Works Agency	Carmody, John M.	Administrator	Privy Council Office	Earl Stanhope	Lord President
Public Buildings Administration	Reynolds, W. E.	Commissioner		Sir Rupert B. Howorth	Clerk of the Council
Public Roads Administration	MacDonald, Thomas H.	Commissioner	Public Record Office	The Master of the Rolls	Keeper of the Records
Public Works Administration	Clark, E. W.	Acting Commissioner		C. T. Flower	Deputy Keeper
U. S. Housing Authority	Straus, Nathan	Administrator	Public Trustee Office	Sir Ernest Fass	Public Trustee
*Works Projects Administration	Harrington, F. C.	Commissioner	Scottish Office	John Colville	Secretary of State
Federal Loan Agency	Jones, Jesse H.	Administrator		Sir Horace P. Hamilton	Under-sec'y of State
*Export-Import Bank of Washington	Moore, R. Walton	Chairman	Shipping, Ministry of	Sir John Gilmour	Minister
*Federal Home Loan Bank Board	Fahey, John H.	Chairman		Sir Cyril Hurcomb	Director-General

Great Britain. —The following were the ministers, permanent under-secretaries, etc., of the more important of the Government departments of Great Britain at the close of 1939:			War Office	Leslie Hore-Belisha*	Secretary of State
				Sir James Grigg	Perm't Under-sec'y
			Works and Public Buildings	Hervald Ramsbotham	First Commissioner
				Sir Patrick Duff	Secretary
			*In Jan. 1940 Oliver Stanley replaced Mr. Hore-Belisha at the War Office, Sir John Reith replaced Lord Macmillan at the Ministry of Information, and Sir Andrew Duncan replaced Mr. Stanley at the Board of Trade.		

Government Expenditures.

The rôle of expenditures for military purposes has become increasingly important and may be expected to rise even more rapidly in the near future as the major war (or wars) in Europe becomes more destructive and widespread. The late conflicts in Manchuria, Spain, Ethiopia and China and those in Europe in 1939 required huge outlays both by the aggressor and the defending nations. Also, as a result of repeated threats to peace throughout the world, an accelerated armament race was begun, and the democratic countries as well as the totalitarian states were making military expenditures, which in many instances were setting (1939) new peace-time records. Until existing conflicts are halted and more enduring peace relations established, there can be no expectation of reduced outlays for armaments.

United States.—Total expenditures of the Federal Government of the United States for the fiscal year ending June 30, 1940 are expected to reach a new post-World War high of \$9,099,000,000. This aggregate is \$392,000,000 or 5%, above the total for the previous fiscal year. According to the Budget Summary submitted by the President of the United States to the Congress on Jan. 4, 1940, the total of regular and emergency expenditures for the national defence of \$1,457,000,000 in 1939-40 is \$401,000,000 higher than in 1938-39. Thus the increase in national defence expenditures closely parallels the rise in total disbursements, indicating little change in the aggregate of all other Federal outlays in 1939-40 as compared with the preceding year. Increases in the 1939-40 expenditures are shown for nearly all items except unemployment relief and the drop in this one item alone from \$2,677,000,000 in 1938-39 to \$1,912,000,000 in 1939-40 was of sufficient magnitude to offset the increases elsewhere. Particularly marked were the gains of \$155,000,000 in the Agricultural Adjustment program, \$171,000,000 on public works expenditures, \$110,000,000 in the interest on the public debt, and \$151,000,000 in the expenditures of the regular departments of the Government. The drop in work relief coincided with a substantial improvement in the general business situation which began at the close of the 1938-39 fiscal year and which was given added impetus by the outbreak of hostilities between the major European powers in Sept. 1939.

GOVERNMENT EXPENDITURES

Table I.—Actual and Estimated Receipts and Expenditures of the United States Government for the Fiscal Years 1931–41

†Expenditures for the fiscal years 1931 to 1938 included in Department of Justice.

‡Includes expenditures in 1941 from supplemental item of \$1,125,000,000 for relief.

Government receipts for the fiscal year 1940 are estimated at \$5,166,000,000, which is practically identical with the total for the 1939 fiscal year. The net deficit was \$3,542,000,000 in the year ending June 30, 1939 and the estimated deficit for the year ending June 30, 1940 is \$3,933,000,000. This will be the largest deficit for any year since the World War, with the single exception of 1936 when the soldiers' bonus was paid and the deficit totalled \$4,550,000,000. In his Budget Message of Jan. 4, 1940, the President submitted his budget recommendation for the fiscal year 1940-41. Despite a further increase of \$377,000,000 in national defence expenditures, the proposed budget calls for a decline in expenditures of \$675,000,000, or 7%, from the 1939-40 peacetime record's total. For all items other than the national defence, the estimated decline exceeds \$1,000,000,000, or one-seventh. Reductions are proposed for most activities with the largest curtailment being the \$548,000,000 drop in unemployment relief. Moderate increases are scheduled in social security disbursements and for the interest on the public debt. Revenues of the Federal Government are expected to be nearly \$400,000,000 higher in 1940-41 than in the preceding fiscal year. This rise in re-

ceipts and the drop in expenditures, coupled with an expected return of surplus funds from Government corporations, are expected to effect a drop in the net deficit from \$3,933,000,000 in 1939-40 to \$2,176,000,000 in the year ending June 30, 1941. The President further recommended new taxes to the Congress for the specific purpose of financing the emergency national defence expenditures. These taxes, which if adopted are expected to yield \$460,000,000, would further reduce the net deficit in 1940-41 to \$1,716,000,000, the smallest in the past decade with the exception of the fiscal year 1937-38.

There has been increased discussion and consideration in recent years in the United States with reference to the treatment in the budget of expenditures for assets of a long enduring nature. In the Federal budget all expenditures, whether for current items or durable assets, are included in determining the deficit or surplus for the year. This differs from the treatment of capital outlays in accounting statements of private business enterprises. A corporation deducts only depreciation on capital assets each year rather than deducting the total cost of the asset in the year when constructed or purchased. In recent years the Federal Govern-

THE TORTOISE AND THE HARE of 1938 and 1939, as pictured by Ray of *The Kansas City Star*

ment has expended billions of dollars for the construction of roads, school buildings, airports, dams, post offices, administrative buildings and other assets which will be useful for many years. Had these outlays not been charged as current expenditures, the deficit would have been reduced considerably and in some years surpluses would have been shown. The President has suggested to the Congress the desirability of capitalizing at least those capital expenditures of the Government which have proved to be self-liquidating. There are many persons who would go further and change the entire budget procedure to accord with the practices of private business enterprise.

Expenditures of State and local Governments in the past five years have been approximately the same as Federal outlays. It is important to take cognizance of the disbursements of all agencies of Government to get a complete picture of Government expenditures. All Government outlays are met by taxes or borrowing and the large magnitude of State and local taxes in the United States makes the public clearly conscious of these units. In 1928 and 1929 State and local Government expenditures were nearly three

times as large as the Federal Government disbursements. Their approximately identical level now reflects a sharp increase in new activities of the Federal Government as well as some shift in functions from the lesser governmental agencies.

Great Britain.—Table II presents a breakdown of the annual expenditures of Great Britain for the fiscal years 1929-1930 to 1938-39, inclusive, and a pre-war estimate of 1939-40 expenditures. Over this entire period, the fluctuation in expenditures has been considerably less than in the United States. The peak of expenditures for this period was estimated at £1,026,000,000 in 1939-40 which is about the same as in 1938-39 and compares with £920,000,000 in the fiscal year 1937-38. This increase is largely accounted for by expanding military outlays. Total estimated expenditures for army, navy, and air service were £256,000,000 in 1938-39 and estimated at £223,000,000 in 1939-40 as compared with £197,000,000 in 1937-38. The expenditure figures for the fiscal year 1939-40 shown in the accompanying table and cited above, represent the budget estimates which were submitted in the early months of 1939, some time before the outbreak of hostilities between Great Britain and Germany. The budget indicated a small decline in defence expenditures in 1939-40, but footnotes in the budget revealed provisions had been made for very substantial defence outlays which could be authorized by a supplementary budget.

Revised estimates of revenues and expenditures for the year 1939-40 were submitted to the House of Commons on Sept. 27, 1939, less than four weeks after the war began. It was pointed out that even prior to the outbreak of the war, there had been substantial increases in defence provisions over those called for in the original budget. On Sept. 1, 1939, there had been a Vote of Credit of £500,000,000 which alone was equal to more than half the total of all expenditure anticipated in the original budget. The revised budget revealed a probable decline in revenues of the Government as a result of the war. The impossibility of predicting the effect of the war upon expenditure was emphasized. It appeared that total outlays for the year might be put at nearly £2,000,000,000, more than double the pre-war expectations. It was stated that the increase would have to be met by borrowing. (See also NATIONAL DEBTS; NATIONAL INCOME.) (R. R. N.)

Government Printing Office. The office was established by authority of Congress in 1860 to execute printing and binding for the executive and judicial departments and the court of claims. Its functions now extend to all branches of the Government and include the sale of official publications, reports and technical bulletins. Many of its publications are printed in foreign languages and find circulation in other countries. When the present construction is completed the total area occupied by the Government Printing Office will be over 1,374,281 sq.ft. of floor space. The value of the

plant, including buildings and equipment will then be well over \$16,765,000. During the fiscal year 1939 there were 5,500 employees on the rolls of the Government Printing Office with a payroll of approximately \$11,500,000. The Office produced a total of 128,676,071 publications of all classes. This total includes 5,302,269 copies of the *Congressional Record*; 5,330,421 copies of specifications of patents, trade marks, designs, etc.; and 233,038 copies of the *Official Patent Office Gazette* and annual indexes. Postal cards printed amounted to 2,136,042,180; money orders shipped, 261,804,697; and the Stores Division handled approximately 90,000,000 lb. of paper. During the year 1939 the Division of Public Documents mailed out 944,076,072 publications and forms; its receipts from the sale of Government publications during the year amounted to \$928,459.88. The total value of all printing done was \$18,238,045.10. (A. E. GL.)

Grapefruit. The United States, the world's leading producer of grapefruit, had a crop of 36,600,000 boxes in 1939, the Department of Agriculture estimated November 1. This compares with 43,794,000 boxes in 1938 and a ten-year average (1928-37) of 18,923,000 boxes. These figures illustrate the important part of grapefruit in the citrus fruit development which has expanded more than any other agricultural commodity in the last 20 years. All the United States production is in four States and was as follows in 1939 and 1938:

	1939 boxes	1938 boxes		1939 boxes	1938 boxes
Florida . . .	17,100,000	23,600,000	Arizona . . .	2,500,000	2,700,000
Texas . . .	15,200,000	15,670,000	California . .	1,800,000	1,824,000

The Florida crop was made up of 6,900,000 boxes of seedless and 10,200,000 boxes of other varieties. Texas grapefruit was shipped to Europe for the first time in 1939. Exports of grapefruit from the United States for the crop years ending Aug. 1939 and 1938 were to the following countries:

	1939 boxes	1938 boxes		1939 boxes	1938 boxes
Canada . . .	835,000	685,400	Philippine Islands .	5,300	4,900
United Kingdom .	243,700	213,600	New Zealand . . .	4,000	6,100
France . . .	27,100	32,500	British Malaya . .	3,500	4,000
Norway . . .	18,000	1,400	Australia . . .	3,400	3,700
Germany . . .	18,000	3,500	Hongkong . . .	3,400	2,300
Netherlands . .	15,700	10,300	China . . .	1,900	800
Sweden . . .	9,500	1,300	Argentina . . .	1,200	2,400
Newfoundland and Labrador . . .	7,400	5,000			

(S. O. R.)

Grapes. Production of grapes in the United States in 1939 was reported November 1 by the Department of Agriculture as 2,470,530 tons, compared to 2,703,000 in 1938 and a ten-year average (1928-37) of 2,214,995 tons. Production in Canada was 50,444,300 lb. in 1939 and 35,973,600 lb. in 1938. The United States exported in the market year of July 1938 to June 1939 almost 40,000 short tons of table grapes, or 14% more than 1938 and 155% more than the five-year average, United States grapes having taken a large part of the European market previously supplied by Spain. Of the 1939 exports 15,205 short tons were to the United Kingdom, 13,923 to Canada, 1,511 to Mexico, 1,267 to the Philippines, 1,248 to Sweden, 1,135 to Cuba. Production of all varieties in California was 2,173,000 tons in 1939 and 2,531,000 tons in 1938, or 1,255,000 tons of raisin grapes, 548,000 tons of wine grapes and 370,000 tons of table grapes in 1939. In 1938 California produced 1,443,000 tons of raisin grapes, 641,000 tons of wine grapes and 447,000 of table grapes.

Production of Grapes by States, 1938 and 1939

	1939 tons	1938 tons		1939 tons	1938 tons
California . . .	2,173,000	2,531,000	Delaware . . .	2,000	1,500
New York . . .	75,600	55,600	Georgia . . .	1,830	1,660
Michigan . . .	58,100	16,000	West Virginia . .	1,750	430

(S. O. R.)

Graphite. Exports of graphite from Chosen in 1938 increased 13% over 1937, to 50,200 metric tons, and from Madagascar by 11% to 12,500 tons, while Ceylon dropped 32% to 11,750 tons and Mexico 28% to 8,200 tons; figures are lacking for Germany, but on the basis of past outputs, including Austria and Czecho-Slovakia, the country now has a potential output of 45,000-50,000 tons. Producers of less importance include Canada, India, Italy, Japan and Norway. Production in the United States has almost ceased. It is important to note that with the annexation of Austria and Czecho-Slovakia, Germany became at the same time the largest producer of graphite, and the only consumer of importance with a surplus supply from domestic sources; all other consuming countries are dependent on imports for most or all of their supply of graphite. (G. A. Ro.)

Gray, Carl Raymond (1867-1939), American railroad executive, was born on September 28 at Princeton, Arkansas. After he had completed his preparatory training he decided to withdraw from school for a time. Finding employment with a railroad at Fayetteville, Ark., in 1883, he never resumed his formal education. He remained with his first employer, the St. Louis and San Francisco railway until 1911, during which time he rose from "helper of a station agent's helper" to senior vice president. In 1912 he became president of the Great Northern railway; in 1914 president of the Western Maryland railway. In 1918 he was director of operations under the U.S.

Government's wartime supervision of railroads. He was appointed president of the Union Pacific system in 1920 and remained in this position until his retirement on Oct. 1, 1937, when he became vice chairman of the board of directors. On Dec. 6, 1936, his 50th wedding anniversary, he and his wife were guests at a dinner attended by 1,400 prominent U.S. railroad officials. He died on May 9 at Washington, D.C.

Great Britain & Northern Ireland,

United Kingdom of. Area 93,991 sq.mi.; pop. (est. June 30, 1939) 47,680,500 (England and Wales, 41,375,000). Chief towns (pop. est. June 30, 1938): London, cap., 4,062,800; Glasgow (June 30, 1939), 1,131,500; Birmingham, 1,041,000; Manchester (including Salford), 932,300; Liverpool, 827,400; Sheffield, 520,000; Leeds, 494,000; Edinburgh (June 30, 1939), 473,200; Belfast (Jan. 1, 1939), 443,500; Bristol, 415,000; Hull, 318,700. Ruler: King George VI; premier: Rt. Hon. Neville Chamberlain; religion: chiefly Protestant Episcopal Church.

History.—It is symbolic of the misfortunes of our times, and of 1939 in particular, that none of the European great powers has time and leisure for a history of its own. Practically all that passes traditionally under the heading of home affairs, domestic politics, the continuous effort to readjust national institutions to the needs of an ever developing society, the pursuit of a better national life, and the traditional conflict of the historic parliamentary parties as to the means by which these ends should be secured—all this or almost all of it has to be cut out. Nearly all domestic activity is rearmament; rearmament is the handmaid of foreign policy, and foreign policy has been forced across the Rubicon into war. European history is once again all one, and in the worst sense.

The division of chapters of history in accordance with the calendar year is inevitably artificial, and it so happens that Jan. 1, 1939 falls midway between the making of the Munich treaty and the breaking of it. Mr. Chamberlain's Munich policy divided the country, and that was really its justification. For if only half (though probably more than half) the population supported the concessions then made to Hitler, it follows that only half would have supported with complete conviction the only possible alternative, which was war—a war the immediate cause of which, at any rate, would have been Great Britain's refusal to permit the transfer of 3,000,000 Sudeten Germans from a foreign to a German Government. The case for Munich was twofold. It was on the one hand a final test of Nazi good faith. If what Hitler had always said was true, that his only expansionist aim was the fulfilment of what had after all been the professed ideal of the victors of 1918, the adjustment of frontiers in accordance with principles of nationality, then the Sudeten crisis would indeed be the last and Hitler would settle down, like Bismarck after 1871, to a policy of stabilization; for there were, except for the special cases of the German speaking peoples in Switzerland and Alsace and certain isolated groups of Germans in Hungary and Rumania no more Germanic groups to which Hitler could lay claim. In spite of all that was hateful about Nazi methods at home and abroad, the Sudeten case was, after all, a weak case for precipitating Armageddon. The other ground of justification for Munich was that, as is now frankly acknowledged, British rearmament was, in Sept. 1938, quite insufficiently advanced.

Mr. Chamberlain's course of action immediately after his return from Munich was entirely in accordance with both these lines of argument. On the one hand he expressed a firm hope, with what degree of inward assurance we do not yet know, that Munich would prove the harbinger of "peace in our time." On the other

hand, in view of the very real possibility that it would not do so, he immediately redoubled the plan of rearmament.

On March 16 Hitler tore up the Munich agreement and on the flimsiest of pretexts annexed the Czech and Slovak remainders of what had been Czechoslovakia. The Czech country was taken into the Reich, and the old provincial names of Bohemia and Moravia restored; Slovakia retained a spectral semblance of independence, which did not prevent its subsequent use as a base for the invasion of Poland.

This ended a chapter, and with it the so-called policy of appeasement, a policy which was not proved the wrong one by the fact that it ultimately failed. In politics as in science the experiment which fails is often a necessary antecedent to the policy which succeeds.

Hitler's ambitions were now revealed beyond question; they were as unlimited as the fantasies of *Mein Kampf*. Indeed the man of action clearly intended to translate into fact the fancies of the man of letters. Lebensraum (living room), the new Nazi alias for imperialism, superseded pan-Germanism as the keyword. One can understand the German point of view. Other European peoples, British, French, Russian, even Dutch and Portuguese, being situated on the circumference of Europe, had expanded over other continents. The Germans, situated so unfortunately in the centre and only achieving the power of unity so late, must also expand. It was not primarily an economic need but something deeper and less rational, a prestige complex. Failing a dominion over non-European peoples Germany must dominate the smaller European peoples by whom she was surrounded. These peoples were not only smaller but in her view inferior, and the proper fodder of imperialism,—what Kipling, in reference to peoples enjoying the benefit of inclusion within the British Empire, had called "lesser breeds without the law."

But deeper than this was doubtless the longing of the Germans to avenge defeat. The pretext alleged was the Diktat of Versailles, but it was a mere pretext.

Whatever the faults of that treaty—and they are often exaggerated—they had practically all been rectified by 1939, except for the return of a miscellaneous and relatively unimportant collection of overseas colonies which Hitler, speaking the truth for once, had declared to be not worth a war. What rankled was the fact of defeat and the unsophisticated longing for a return match with a different result. Any schoolboy can understand this; and the power of Hitlerism is based on systematically barbarized youth. In this sinister respect war is still a sport, not of kings but of peoples, and President Wilson's earlier and derided ideal of "peace without victory" gains a fresh significance, for it may be doubted if the victory of 1918, even without the vengeance of Versailles, could have achieved the better world which the victors in the war which began in 1939 will have to try to establish.

In the new conditions inaugurated by the final destruction of Czechoslovakia, Great Britain and France at once took the initiative. Formal guarantees of protection, subsequently elaborated in treaties, were extended to the states of Eastern Europe and beyond which seemed likely to be the next victims of aggression—Poland, Turkey, Rumania and Greece. This was for Great Britain a momentous departure; for it was remembered that in 1925, while guaranteeing the "Western" Locarno treaty, Great Britain had refused to guarantee the Eastern treaty concerning the frontiers of Poland.

The guarantee to Greece envisaged the possibility of attack from Italy, who had invaded Albania three weeks after Germany occupied Czechoslovakia. On May 22 a treaty of military alliance was concluded between Italy and Germany, and there seemed every reason to suppose that a war with one of the "Axis" powers would mean a war with the other, especially as, while Germany

was conducting a furious press campaign against Great Britain, the Italian press was treating France, presumably by arrangement, to a similar series of tirades.

Meanwhile the German preliminaries to an attack on Poland were developing along all too familiar lines, the demand for Danzig and the so-called corridor of Polish territory which separated Danzig and East Prussia from the main body of the Reich, playing the same part as the demand for the Sudeten territory had played in the case of Czechoslovakia. It was obvious policy in these circumstances to bring Russia into the anti-aggression alliance. Franco-British negotiators were sent over in May, but in spite of vaguely hopeful reports little progress seemed to be made. It was a discouraging circumstance that at an early stage of the negotiations Litvinov, of recent years a strong upholder of the League of Nations, gave place to Molotov, about whom nothing favourable was known, as foreign minister of the U.S.S.R. The British Labour party blamed the supposedly "Fascist" leanings of Mr. Chamberlain for the lack of progress in these negotiations, but it is now apparent that Russia's price was the surrender of the independence of some of the Baltic states, and this was a price Great Britain was not prepared to pay. On general grounds it is obvious that Russia would wish to get back the predominantly Russian regions of eastern Poland, regions which the Polish Government had originally occupied in disregard of the frontier laid down for eastern Poland after the last war, and that on this demand she could do a deal with Germany but not with Britain. However, in July allied negotiations with Russia reached a point at which it seemed reasonable to send over a Franco-British military mission to concert measures of common military action in case of war with Germany.

On August 21 the whole situation was transformed by the news that the Nazis, the authors of the Anti-Comintern front, who had always proclaimed as their special mission the protection of European civilization from Bolshevism, were about to conclude a pact of non-aggression with Russia. Only 12 days now remained before the outbreak of the war, an interval exactly the same as that between the Austrian ultimatum to Serbia and the outbreak of war in 1914. As a matter of fact the delay was longer than might have been expected since, from the Nazi standpoint, nothing seemed to remain to be done. While Europe mobilized, various neutrals, among them Mussolini, made offers of mediation that were foredoomed to fail, and on September 1, alleging that the Poles had rejected peace terms which in fact they had never seen and which seem to have been composed solely for purposes of subsequent propaganda, Hitler sent his air force to bombard Warsaw. The next day the British and French ultimatums demanded the immediate withdrawal of German forces from Polish territory. When the time limits attached to these ultimatums had expired Great Britain and France were once again at war with Germany.

There can be no doubt that the progress made in national defence by Great Britain in the 11 months between "Munich" and the outbreak of the war was an amazing achievement, which was prolonged in crescendo during the first months of the war, in which none of the services except the navy were fully engaged. For anything approaching a Blitzkrieg (lightning war) against his principal antagonists Hitler seems to have realized from the first that he was too late. Here it is possible to mention only a few salient facts. In January the first list of areas to be evacuated in the event of war was issued, and the prime minister appealed for the enrolment of volunteers for national service. In February the first steel air raid shelters were delivered in London. By the outbreak of war a civil defence force of A.R.P. (air raid precaution) workers, 2,500,000 strong, was ready for mobilization. Trenches to hold 500,000 had been dug and steel shelters to protect 6,500,000 had been distributed. Gas masks were supplied to

the whole population. In the first few days of September 1,500,000 people, mostly children and mothers of children under five years of age, were evacuated from dangerous areas. These were precautions against a form of attack, the wholesale air raid, which has not yet been launched. Evacuation was voluntary. Not much more than half the intended evacuees availed themselves of the facilities provided, and of them a considerable number have already drifted back to their homes. The social problems, both in general and in every single "reception" household, may well provide themes for novels now being written. Whatever the evils entailed, thousands of slum children have experienced a country holiday on a scale no philanthropic society could ever hope to give them.

At the end of March the Government announced the doubling of the Territorial army, raising the numbers to 340,000. In May the Compulsory Service Bill was carried through all its stages after half-hearted opposition from the Labour party. It provided for six months' compulsory training for all men between the ages of 20 and 21. The first batches of men were called up in July, and the measure was of course later supplemented by a general measure of conscription under which all between the ages of 20 and 41, outside certain reserved occupations, are liable to be called up as required. There were a few thousand conscientious objectors, far fewer than seemed likely a few years ago, and the generous treatment accorded them avoided the bitterness that this subject aroused in "left-wing" circles during the later stages of the last war. There is, indeed, no pacifist problem in Great Britain today, and the Labour party's only quarrel with the Government seems to be that their war measures are not sufficiently drastic.

During the earlier months of the year there was a strong demand in the press for a broadening of the base of the Government, and more particularly for the inclusion of Mr. Churchill. As soon as war broke out Mr. Churchill joined the war cabinet and went to his old war-station at the Admiralty. The war cabinet consisted of nine members, most of them the heads of departments directly concerned with the conduct of the war. The leaders of the Labour and Liberal parties were invited to join the government, but refused on the ground that at present they could perform more useful service outside.

Before proceeding to outline the events of the war up to the end of the year it is necessary to mention certain events unconnected with the war which befell in the pre-war period.

When the year opened the formidable Arab rebellion against the British Government and the Jewish colony was still in progress though the worst of it was over.

The Palestine Conference in London, during February and March, ended in pre-ordained failure as neither Jews nor Arabs would even discuss each other's proposals, and the colonial secretary issued a British scheme the main feature of which was that the British did not propose to undertake responsibility for the thankless task of governing Palestine for more than 10 years. Since the war began both Jews and Arabs have for the time being laid aside their differences and undertaken to support the British Government.

In March the Spanish civil war came to an end, and General Franco's government received British recognition.

In the same month President Lebrun paid a state visit to England and in May the King and Queen made an extensive Canadian tour after which they visited President Roosevelt at Washington.

The record of social legislation, in the ordinary sense of the term, was perforce meagre, rearmament and foreign policy occupying most of the time and an even larger share of the attention of both government and parliament. When war broke out many bills of a contentious character had to be abandoned, and it was a pity

that among them was a comprehensive Criminal Law Reform Bill. Attempts were made to save it as it was for the most part an agreed measure, apart from the clauses abolishing the infliction of corporal punishment except for serious offences committed by prisoners while serving their sentences. It is, however, worth recording that in spite of the crushing burden of taxation for defence purposes there was no curtailment whatever of the social services. Unemployment fell steadily during the first half of the year and the last two months of peace showed the lowest totals (about 1,200,000) for 10 years. The first months of the war brought a rise in these figures because the dislocation of peace industries exceeded at first the development of war employment, thus repeating the experience of 1914.

The year, again like 1914, and also 1931, the year of the "great slump," suffered the misfortune of two budgets. In his April budget, Sir John Simon had to make provision for an expenditure of £630,000,000 on defence (as compared with £400,000,000 in the previous year), and of this sum £380,000,000 was to be raised by borrowing. Total expenditure for the year (April 1939–March 1940), including the sum to be borrowed, was estimated at £1,322,000,000. The standard rate of income tax was left unchanged at 5s.6d, but rates of surtax and estate duty were increased, as also the tax on private motor cars, tobacco and sugar. The estimates on which this budget was based were already out of date before the end of the session in July. On Sept. 27, 1939, Sir John Simon introduced a war budget, envisaging expenditure of practically £2,000,000,000 up to the end of the financial year.

The standard rate of income tax was now raised to 7s. for the remainder of the current year and 7s.6d. in a full year, and a tax of 60% was imposed on the profits above previous standards of all trades and businesses. By these and other additional taxes the chancellor hoped to raise just over half the estimated expenditure out of current revenue. Loans suitable for small subscribers were issued before the end of the year, borrowing from the general public on a larger scale being postponed until 1940.

Economists have been exercised in their minds by the allied problems of borrowing and inflation, and Mr. Keynes put forward a scheme for a compulsory loan, collected after the manner of income tax and repayable in the slump period which is bound to follow the war. Criticism appeared to suggest that, though the scheme might be logically sound, it was not yet, and might never be, politically feasible.

Parliament was recalled on Aug. 24, 1939, three days after the announcement of the Russo-German pact. It continued to sit for several days each week until the Christmas recess. At first its principal duty was to enact a spate of emergency legislation, prepared in advance and held in readiness for the occasion. Since then the meetings have both mirrored the essential unity of the nation and afforded a platform for outspoken criticism of ways and means.

UNITED KINGDOM: Index of business activity (*The Annalist*)

The Prime Minister's weekly reviews of progress have been supplemented from time to time by reviews of the activities of the different services by the ministers in charge of them. Among the critics, Mr. Greenwood, deputy leader of the Labour opposition, distinguished himself by the vigorous and outspoken patriotism of his utterances.

The outbreak of the war revealed, as all but the enemy expected, the unity of the Empire. Eire, it is true, availed herself of the freedom of commonwealth institutions to declare her neutrality. In South Africa, General Hertzog, intending to pursue a similar policy, was defeated in his parliament by 80 votes to 67 and replaced by General Smuts, who shares with Mr. Churchill the honour of being a leading statesman in both the German wars. Canada, Australia and New Zealand were all in from the start, and Canadian troops and Australian airmen had already reached Great Britain before the end of the year. In India the performances of Congress politicians did not conceal the profound agreement of the Indian peoples with the determination of the rest of the Empire to destroy the forces of Hitlerism, and Indian troops were already serving in France before the year ended. All other parts of the Empire served the common cause, each according to its capacity and opportunity.

The war also revealed the absolute unity and identity of the Franco-British combination. In this respect, if no other, the war in 1939 began where the World War left off. The British expeditionary forces in France were acting under the supreme command of General Gamelin, and French units within the British sections of the line were under the British higher command. In industrial and economic policy, also, the Allies were pooling their resources and acting as one. History has never before seen independent and equal powers so closely combined. They are, for war purposes, at least, two nations but one "commonwealth."

In other respects, however, the war had falsified nearly every forecast.

Those who envisaged a war in the earlier part of the year expected Germany to find an ally in Italy, possibly also in Spain, where General Franco owed his victory, at any rate in part, to Italian and German support, possibly also in Japan. It would, in fact, be a war with the whole or a part of the much boosted anti-Comintern front; yet all these countries stood neutral. Few, if any, expected the collaboration of Hitler and Stalin, even though they realized that both were equally the enemies of all that free peoples hold dear. And as in the grouping of powers so also in strategy; the Blitzkrieg from the air, the attempted knock-out blow at the heart of Germany's most powerful enemy, had not by the end of 1939 been delivered. Months passed before a single enemy bomb dropped on British soil, and then it fell on one of the Shetland islands.

It is not possible in this article to give more than the briefest outline of the events of the first four months of the war. For events of the first four months of war see BLOCKADE; EUROPEAN WAR; SHIPPING, MERCHANT MARINE; STRATEGY OF THE EUROPEAN WAR; SUBMARINE WARFARE; TACTICS IN THE EUROPEAN WAR. And, indeed, apart from the German conquest of Poland and the assault of Russia upon the liberties of Finland, it has been on land and in the air an "affair of outposts" only. On land, with Belgium neutral, the western front was less than half the length of the western front of 1914–18, and along the whole of that front the Maginot and Siegfried lines (*qq.v.*) rendered a general assault suicidal for the attackers.

In the air, British raiders over Germany had dropped leaflets instead of bombs. Air fighting on the British coast, over Heligoland and the Kiel canal and along the western front, have revealed again and again the quality of the British and French machines and the daring and skill of the British and French pilots.

The main German undertaking since the first day of the war has been an attempt by U-boats, by mines and by commerce destroying raiders, to break down the British command of the seas and to destroy the overseas commercial activities on which the very life of the country depends.

Germany started the war with about sixty submarines, and as many of these had been despatched to war stations in advance, and as British ships were engaged all over the world on their normal unconvoyed activities, the losses of the first fortnight were inevitably heavy, between a third and a quarter of the whole of the total mercantile tonnage, allied and neutral, sunk in the first four months of the war. That total, nearly 400,000 tons, however deplorable, was a quite inconsiderable fraction of the total tonnage, and was, indeed, balanced by the output of the shipbuilding program and the capture of such enemy ships as remained at sea and awaited capture before being scuttled. It seems demonstrated that the U-boats, which came so near winning the war in 1917, cannot materially affect the issue under present conditions. About forty U-boats were (Jan. 1, 1940) destroyed, and though the Germans may be building new ones as fast or faster than they lose them, it is doubtful whether they can train fresh crews of the calibre of those they are losing.

After the U-boat attack began to fail the Germans achieved some success, mostly at the expense of neutrals, by laying magnetic mines from aeroplanes; but this new (and illegal) weapon was largely mastered by a bold aerial patrol over the mine-layers' bases. Of Germany's three pocket battleships, one was damaged by an aerial attack on the German base; another, the "Graf Spee,"

MORE THAN A MILLION CHILDREN were evacuated from London and other British cities Sept. 1, 1939, to spots in the country relatively safe from air raids

after a long inning of commerce destruction in the southern seas, was brought to book by three British cruisers off the coast of Uruguay, in the most remarkable naval action of the war in 1939. Retiring injured to Montevideo, she was ordered to leave after her time had expired by the Uruguayan Government, acting in accordance with the terms of international law, and was scuttled outside the harbour by order of the German Government.

The British Navy suffered losses which, though tragic, cannot be regarded as seriously damaging. The "Courageous" and "Royal Oak" were sunk by submarines, the latter within the confines of Scapa Flow. The "Rawalpindi" was destroyed by the pocket battleship "Deutschland"; two destroyers and a number of smaller craft were lost by striking mines in 1939.

Sea-borne commerce is, of course, severely restricted, not by the successes of the Germans, but by the working of the convoy system, which is, in itself, one of the best insurances against German attack.

Nothing that happened in 1939 suggested that the Germans had any chance of winning the war along the lines on which their efforts had during that year been mainly directed. (D. C. So.)

Education.—In 1937-38: elementary, England and Wales, departments under separate head teachers 29,988, scholars on register 5,150,874; elementary, Scotland—schools 2,895, scholars 617,047; elementary, Northern Ireland—schools 1,700, scholars 191,862; secondary, England and Wales, grant-aided schools 1,398, scholars 470,003; secondary, Scotland—grant-aided schools 252, scholars 156,645; secondary, Northern Ireland—grant-aided schools 75, scholars 14,557; universities, students: England 41,707 (full time, 36,378); Wales 3,089 (full time, 2,970); Scotland 10-

employment (1929=100) av. (1938) 111.0; av. (Jan.-June 1939) 113.5. Industrial population, insured (July 1929) 14,838,000; unemployed, wholly, av. (1938) 1,423,662 (10.3%); temporary, av. (1938) 378,918 (2.8%); wholly (Aug. 31, 1939) 1,058,989 (7.1%); temporary (Aug. 31, 1939) 216,372 (1.5%).

(See also CZECHO-SLOVAKIA; DEMOCRACY; EUROPEAN WAR; JAPAN; PROPAGANDA.) (W. H. WN.)

Greece. Area 50,147 sq.mi.; pop. (est. Dec. 31, 1938) 7,107,000. Chief towns: Athens (cap. 392,781), Salonica (236,524); ruler: King George II; language: Greek; religion: Christian (Greek Orthodox).

History.—Italy's seizure of Albania (*q.v.*) caused much uneasiness in Greece, where troops were moved up to the frontier and fortifications constructed; although the Government declared that Italy would respect Greece's integrity. On April 13 Britain and France declared that they would lend Greece all the help in their power, should action be taken which threatened her independence and which she felt it vitally necessary to resist by force of arms. After the European war broke out, however, Italy's change to a more defensive attitude eased the position of Greece. On September 20 it was announced that she and Italy were withdrawing their troops from the Albanian frontier, and on October 30 a

further exchange of notes was said "to have the effect of a Pact of Friendship." Subsequently, the press strongly stressed these friendly relations with Italy. Meanwhile, Greece's friendship with Turkey remained unimpaired, and her Balkan policy was based on the Balkan Entente. In internal affairs, the Metaxas regime continued unchanged. The two objects to which the Government devoted its chief energies were military preparedness and economic self-sufficiency, and various measures were taken directed towards each of these objects.

Education.—In 1936-37: elementary schools 9,207; scholars 1,038,974; secondary schools 522; scholars 86,957.

Banking and Finance.—Revenue (est. 1938-39) 14,519,062,942 drachmas; expenditure (est. 1938-39) 15,106,354,667 drachmas; public debt (Nov. 30, 1938) 52,127,000,000 drachmas; notes in circulation (April 30, 1939) 8,255,210,050 drachmas; gold and gold exchange reserve (April 30, 1939) 4,274,505,394 drachmas; exchange rate (1938-39) 550 drachmas=£1 sterling.

Trade and Communication.—Foreign trade (merchandise): imports (1938) 14,761,395,000 drachmas; (Jan.-Aug. 1939) 9,092,000,000 drachmas; exports (1938) 10,140,180,000 drachmas; (Jan.-Aug. 1939) 4,890,800,000 drachmas. Communications 1938: roads, suitable for motor traffic 7,708mi.; railways open to traffic 1,672mi.; shipping, tonnage (June 30, 1938) 1,872,165 gross tons.

Agriculture, Manufactures, Mineral Production.—Production 1938 (in metric tons): wheat 983,452; (1939) 960,000; wine 410,015; barley 245,504; (1939) 217,700; maize 199,484; (1939) 172,500; olive-oil 106,463; oats 152,479; (1939) 152,600; cotton 48,563; iron ore (1937) (metal content), 145,000; tobacco 41,574; potatoes 143,003; rye 61,963; (1939) 62,500; lignite (1937) 131,080.

Industry and labour: index of industrial production (1929=100) (average 1938) 165.1; workers insured against sickness, accidents, etc. (1938) 351,059.

Grey, Zane (1875-1939), American author, was born at Zanesville, O. on January 31, the son of a backwoodsman preacher.

Grey in his youth studied dentistry and practised for six years in New York city before giving up his profession for writing. His first book, *Betty Zane*, appeared in 1904. His most successful novel was *Riders of the Purple Sage* (1912) which sold almost 1,000,000 copies. In all he wrote more than 50 novels, most of them about the Far West in the days of U.S. expansion toward the Pacific.

Among his other books are *Desert Gold* (1913), *The Lone Star Ranger* (1915), *Rainbow Trail* (1915), *Wildfire* (1917), *The Thundering Herd* (1925) and his last, *Western Union* (1939). He died at Altadena, Calif., on October 23.

Grinnell, Joseph (1877-1939), American zoologist, was born at Old Ft. Sill, Okla., on February 27. He graduated from Throop Polytechnic institute (now the California Institute of Technology) in 1897 and received his master's and doctor's degrees at Stanford university. In 1900 he joined the faculty of Stanford university, and from 1908 until his death he was director of the California Museum of Vertebrate Zoology at the University of California, where he was also professor of zoology. An authority on Alaskan fauna, he presented his entire collection of 8,300 specimen skins of North American birds to the University of California in 1920. He died at San Francisco on May 29.

Groener, Wilhelm (1867–1939), German general and statesman, was born November 22 at Ludwigsburg, Wurttemberg. On his 17th birthday he became an ensign in the German Army and by 1912 he had been promoted to a lieutenant colonelcy. At the beginning of the World War (1914–18) he was director of railway operations for the General Staff. His promotion thereafter was rapid; in 1916 he became a major general and departmental head of the War Office, and in 1918 he succeeded Ludendorff as quartermaster-general of the army. After the war he took charge of demobilizing the defeated German troops. Under President von Hindenburg he became minister of defence (1928) and minister of interior (1931) of the republic. As minister of interior he outlawed Hitler's Storm Troops and otherwise attempted to stem the rising power of the Nazis. Nevertheless, when Hitler assumed control of the state in 1933 he permitted Groener to retire.

He died at Potsdam on May 4. See *Encyclopædia Britannica*, vol. 10, p. 903.

Guadeloupe, a French West Indian colony comprising the two large islands Basse-Terre and Grande-Terre, separated by a narrow channel, and five smaller islands, in the Windward group; language, French; capital, Basse-Terre; governor, Félix Éboué. The area is 688 square miles. The population (304,209 by the 1936 census) was estimated at 310,000 on Jan. 1, 1938. Chief cities (with 1931 populations) are Basse-Terre, 9,268; Pointe-à-Pitre, 30,465; Le Moule, 17,107. The colony is administered by a governor and an elected general council, and has representation by a senator and two deputies in the French parliament. External communication, somewhat disturbed in 1939 by the European war, is by steamer and air transport service. During the year a 278,000,000 franc public works program, including highway improvement, sanitation, harbour development at Pointe-à-Pitre, and low-cost housing, went forward. Trade is largely with France. In 1938 imports totalled \$8,465,000, exports \$11,851,000 (\$9,820,000 and \$13,545,000 respectively in 1937). Imports are foodstuffs, textiles, beverages and lumber; exports, the chief products, are sugar, rum, bananas and to a less extent coffee, cacao and vanilla. In 1938 sugar and bananas reached all-time highs in production. One-third of the entire area is under cultivation and is highly productive. There are 18 sugar mills and 94 rum distilleries. The monetary unit is the French franc (value: 2.25¢ U.S.). In 1938 the budget was balanced at 69,527,243 francs, and on Jan. 1, 1938, the outstanding indebtedness was 11,202,004 francs. (See also WEST INDIES.) (L. W. BE.)

Guam, a possession of the United States of America and the largest and most populous island of the Marianas, lies at the southern end of that group, approximately 1,500 miles E. from Manila; area about 225 sq. mi.; population on July 1, 1939, 22,843, including 21,199 natives of Guam who are called Chamorros; the remainder are foreign-born and personnel of the U.S. Naval Establishment. The capital and only city is Agana, having about one-half the total population of the island.

The island was discovered March 6, 1521, by Magellan and remained a Spanish possession until June 21, 1898, when it was captured by the United States, later being ceded to the United States by the Treaty of Paris. Since acquisition it has been under the jurisdiction of the Navy Department with a naval officer commissioned as governor by the President. The people are regarded as wards of the United States. Immigration, while not prohibited, is not encouraged and no alien may own land.

Public schools had an average enrolment of 4,217 during 1938–39. Emphasis is placed upon the English language, health and sanitation, and upon industrial and agricultural training.

Health and sanitary conditions are very satisfactory. All medical attention is given by the naval medical officers who treat the people free of charge.

Hospitalization is also provided without cost. The only bank is the Bank of Guam, conducting a commercial banking business as a division of the Treasury of the Naval Government of Guam, which owns the capital stock. Copra is the only export of importance; 2,229 tons were exported during the fiscal year 1939. The community is essentially an agricultural one. The land is fertile and native foodstuffs are plentiful. (L. S. F.)

Guatemala, second largest and most northerly of the Central American republics; language, Spanish; capital, Guatemala City; president, General Jorge Ubico. The area is 48,290 square miles. The population is 3,044,490 (Dec. 31, 1938 official estimate).

The leading cities are: Guatemala City, 166,456 (1938 census); Antigua, 40,000; Quezaltenango, 35,000 (est.); Totonicapan, 30,000 (est.); Coban, 27,000 (est.).

During 1939, the country continued quiet under the quasi-dictatorship of President Ubico, but with a noticeable growth of anti-foreign sentiment. In March the Government seriously restricted foreigners in business, and tightened immigration laws to reduce foreign control of commercial activities. In May, all alien political societies were ordered dissolved, and five months later formal warnings were given German radio officials to confine their broadcasts in the republic to the truth. During the year agitation arose for the annexation of British Honduras (conceded to Great Britain by treaty in 1859), and the Government took the official stand that British non-compliance with the treaty had invalidated it. Meanwhile, the republic drew closer to the other American nations.

Guatemala had 850 mi. of railway and 3,636 mi. of highway, with 792 mi. under construction in 1939. Steamship and air service are the principal means of external communications.

Despite unsteady coffee prices, trade throughout the year was normal until September, when it became exceptionally active because of the outbreak of war in Europe. War conditions enabled the United States to strengthen its leading position in Guatemalan trade at the expense of Germany, normally second. Imports in 1938 were \$16,671,388 (United States, 45.7%; Germany, 35.1%), exports \$16,366,623 (United States, 69.5%; Germany, 14.1%). The United States regularly takes over 60% of the country's predominant export, coffee. Banana production, second in export importance (10,723,216 stems in 1937–38), underwent a rapid increase in 1939, due to continued development of new plantations on the west coast, while chicle, 7.7% of exports, set an all-time record. The monetary unit is the quetzal (value: \$1.00 U.S.). Guatemala has over 2,500 schools, with an enrolment in excess of 145,000 pupils. A tremendous advance in education in recent years resulted in over 50,000 pupils in schools, 2,405 soldiers, and 752 prisoners being taught to read in the single year 1937–38. Military service is compulsory. The army numbers 7,000 men.

BIBLIOGRAPHY.—B. Addison, *Guatemalan profile* (1939). (L. W. BE.; M. L. M.)

Guggenheim, Murry (1858–1939), U.S. financier and philanthropist, was the third of the eight sons of Meyer Guggenheim, Swiss emigrant who built a large fortune in mines and smelting plants. Murry Guggenheim was born at Philadelphia on August 12. With his father and brothers he organized in 1881 the firm of M. Guggenheim's Sons, which later became Guggenheim Brothers. In 1929 he established the Murry and Leonie Guggenheim Foundation for a dental clinic in New York city. During his lifetime the foundation granted ap-

propriations of about \$1,900,000, and to it Mr. Guggenheim bequeathed \$5,000,000 in his will, probated shortly after his death on November 15 at New York city.

Gynaecology and Obstetrics. Each year sees at least a small decline in deaths from obstetric causes. In the United States, for example, the maternal mortality has been reduced from 65 per 10,000 live births in 1931 to 44 per 10,000 in 1937.

It will be surprising if a reduction in the world's maternal death rates can be reported for 1939, and certainly not for the years of the war in Europe, because war always takes its toll of pregnant and parturient women and their babies.

Haemorrhage, toxemias, and infections still lead the list as chief causes of the fatalities. Fortunately, the majority of these are preventable. Colebrook and Purdie were responsible for the beginning of the successful use of sulphanilamide in puerperal infections. This has been found useful also in venereal (gonorrhoeal) and in renal infections such as pyelitis and cystitis. Even in this short time it is apparent that the general death-rate from puerperal infection has been definitely lowered by the discovery and use of this drug.

The problem of dystocia, or difficulty in delivery, is being met by the recent developments in Roentgen-ray pelvimetry. It is still the custom to measure the bony pelvis of each pregnant woman by means of callipers. Those that are found to show average measurements may be expected to be able to deliver babies of average size without especial difficulty. Contractions of the pelvis, as indicated by shortened measurements, lead the obstetric attendant to expect certain difficulties which must be met by appropriate measures. Many border-line degrees of pelvic contraction, and various specific types of pelvic deformities afford considerable difficulty, however, in arriving at a decision that an operative delivery is or is not necessary.

Thoms of New Haven has developed a Roentgen-ray method of making accurate measurements of the maternal pelvis with the help of a lead grid perforated at one centimetre intervals, these perforations being thrown on the film by a second exposure after having taken a picture of the patient's pelvis. Caldwell and Moley of New York have utilized stereoscopic Roentgen-ray pictures for measuring pelves, and have developed a morphologic or developmental classification of pelves. Each of these forms seems to have a typical mechanism of labour, which can be predicted with considerable accuracy.

There are certain anaemias peculiar to pregnancy, which may have serious consequences if allowed to go untreated. One of these (macrocytic) resembles pernicious anaemia, but responds promptly to liver extract therapy, alone or with iron, and is not permanent.

Some interesting new observations have been made in the behalf of diabetic women bearing children. Insulin has preserved the lives and health of many diabetic girls who formerly could not have survived to grow up into young womanhood. Many of the infants die *in utero*, due probably to the disturbance in the mother's metabolism of carbohydrates from which the foetuses derive their nourishment. Foetuses developing to term are likely to be overweight, probably from certain variations in these same metabolic processes, and of those born alive many die suddenly during the first few days after birth. Such an infant before birth seems to be stimulated by the mother's lack of insulin from her diseased pancreas and consequently produces more insulin than is

usual to help make up the maternal deficiency. This overproduction on the part of the baby continues for a time after its birth, and may burn its circulating carbohydrates (sugars) so that it develops even fatal degrees of hypoglycaemia or low blood sugar. The preventive treatment consists in giving, routinely, intravenous or subcutaneous injections of dextrose (sugar) solutions to the baby of a diabetic mother for a few days following its birth, in order to offset the excessive insulin formation until this settles down to a normal rate.

Goodall and his associates have made the recommendation that blood from the placentas of new born children be saved, rather than wasted as usual, grouped or typed by the conventional laboratory methods, preserved by the chemicals of the Moscow Institute formula and held in readiness in a "blood bank" for transfusion purposes, for obstetric, gynaecologic, or even other emergencies.

Of couples who are now childless at least 40% can have children after proper study and appropriate treatment, provided no gross lesions exist such as from maldevelopment of the male or female genital organs or actual destruction of anatomic relations as from certain inflammatory diseases or from tumour growths.

Illustrations of certain of the investigative steps in the diagnosis of the causes of sterility are shown because of their interest, as well as their simplicity but at the same time their ingeniousness. The Rubin test, devised by Isadore Rubin of New York consists in the passage of carbon dioxide gas through the uterus and the fallopian tubes for the purposes of gauging the degree of possible constriction of the tubes or egg-passages, and for distending them and opening them more widely when constricted. The uterus and tubes may be injected with an opaque medium and Roentgen-ray pictures taken to detect small tumours and tubal obstructions. The spermatozoa are now studied under the microscope not only to determine their motility but also the percentages of abnormally developed forms. Many other details of study are essential but these are among the outstanding ones.

The use of basal anaesthetics for minor and major gynaecologic operations with a consequent reduction in the amount of inhalation anaesthetics is attracting considerable attention among gynaecologists. This is effected by various combinations of analgesic and anaesthetic medication. For example, a patient in her bedroom an hour or two before operation may be given morphine and scopolamine by hypodermic injection, followed presently by a rectal injection of paraldehyde or of a preparation named Avertin (tribomethyl alcohol). She is sleeping when transported to the operating room, and usually requires considerably less inhalation administration of anaesthesia (nitrous oxide or ether) than by the older methods. Schumann of Philadelphia reports that these basal methods with or without a small amount of nitrous oxide, or with local infiltration anaesthesia, have permitted him in his clinic almost entirely to abandon ether anaesthesia even for major abdominal operations.

The use of electro-surgical cauterization, coagulation, or conization by cutting loops has now become so perfected that many patients with inflammatory lesions or old lacerations of the mouth of the uterus can be treated thus as ambulatory office patients rather than by hospitalization and operation as formerly. These procedures require special apparatus in order to avoid bleeding and subsequent constrictions of the passages, but the economic saving to the patient is tremendous.

Occasionally, because of congenital maldevelopment, it becomes necessary for the gynaecologist to dissect the tissues of the pelvic floor and to construct an artificial vaginal tract by means of tubular grafts. The operation is difficult, and the results often uncertain. This is chiefly because of the difficulty in obtaining tissue for grafting and in making it live after its implantation.

Burger, of Budapest, Hungary, has described an ingenious improvement in this operation, utilizing sterile fresh foetal membranes for the graft material.

The vasomotor disturbances from which women suffer at the time of menopause, or "change of life," such as flashes, dizziness, drenching perspiration and similar symptoms, have been treated quite successfully by the administration of oestrogenic hormone. This is an extractive from animal sources, and its preparation is laborious and costly. Consequently, as a medicine it is expensive and many persons who need it find it difficult to buy it, especially in the more concentrated dosages, and difficult to continue its use over the weeks and months of a prolonged menopause.

Chemists have identified the chemical constituents of oestrogenic hormone, and have endeavoured to prepare synthetically an identical chemical substance in the hope that this will have similar therapeutic effects. Such a substance (stilboestrol) has now been prepared at a greatly lowered cost, animal experimentation has demonstrated its harmlessness and also its clinical effectiveness, and limited quantities have been distributed to certain chosen gynaecologists in the United States, Canada and Europe for clinical use with selected patients, the effects to be carefully observed. It has not yet been placed on the market commercially, as its clinical trial has not been completed, but early reports indicate that it may be a successful substitute for the more costly extractives.

Gypsum. After having dropped during the depression years from a peak of some 12,500,000 metric tons annually to about 7,100,000 tons, world gypsum production has recovered to a level of about 10,000,000 tons. The principal producers, with their approximate outputs are: United States 3,000,000 tons; France, Spain, United Kingdom and Canada, each about 1,000,000 tons; Germany 850,000 tons; Italy 400,000 tons; the remainder is widely distributed among some two dozen different countries, few of which have outputs as high as 100,000 tons.

The 1938 output in the United States, 2,684,000 short tons, was 12% below 1937 and less than one-half of that reached in 1925, but the output is gradually increasing, as the building industry comes back more nearly to normal.

About one-quarter of the current output is used in cement manufacture in crude form, while 1% is used by agriculture as a soil addition and 3% goes to various minor uses; the remainder is calcined and, except for some 7% that is used in the glass and ceramic industries, is absorbed in the production of plasters, wall-board, and other building products. U.S. production is supplemented by imports, chiefly from Canada, to the extent of about 20% of the consumption. Canadian production in 1938 was 1,019,000 short tons, but preliminary figures for 1939 are somewhat lower; about 80% of the output is exported, nearly all to the United States. (G. A. Ro.)

Haab, Robert (1865-1939), Swiss statesman, was born August 8 at Waedenschwil on the Lake of Zurich and studied law at the universities of Zurich, Strasbourg, and Leipzig. Later he became mayor of his native town and a member of the Zurich State council, then an official of the Swiss Federal

railways. In 1917 he acted temporarily as Swiss minister to Germany. He was twice elected president of the Swiss Confederation for the terms of 1922 and 1929. Haab died at Zurich on October 15.

Hácha, Emil (1872-), Czech statesman, was born at Trbové Sviny, Bohemia, the son of a tax administration official, and was educated at Budějovice (Budweiss) and the Charles university, Prague, where he studied law. He gained his doctorate in 1896, and from 1898 till Dec. 1916, when he became court counsellor at the administrative court of Vienna, was in the service of the provincial committee of the kingdom of Bohemia. After the revolution of 1918 he became (November 23) senate's president of the Prague administrative court in the newly established republic of Czechoslovakia, becoming second president in March 1919 and first president of the supreme administrative court in 1925. On Nov. 30, 1938, following the resignation of Dr. Benes and the interim Government of General Syrový, Dr. Hácha was elected president by 272 votes out of 312; he received the resignation of General Syrový that afternoon, and on the following day appointed a new Government under M. Beran. In 1939 he was the chief witness to his nation's final extinction. Shortly after it became apparent that the republic was about to collapse, Dr. Hácha made a hurried trip to Berlin, where he was received with due honour. In an interview with Hitler he "requested" the Fuehrer to proclaim a German protectorate over Bohemia and Moravia. Little was heard of him during the rest of 1939, except that he retained anomalous office as "president" of the Bohemian-Moravian protectorate and issued periodic appeals to the Czechs to co-operate with the Germans. A lawyer of international standing, he was long a member of the Permanent Court of Arbitration at The Hague. He is a fluent speaker of both English and German and has published Czech translations of Kipling and Stevenson.

Haiti, a West Indian republic occupying the western third of the island of Hispaniola; language, French; capital Port-au-Prince; president, Stenio Vincent. The area is 10,204 square miles. The population is approximately 3,000,000, and is almost entirely Negro. The chief cities are Port-au-Prince, 125,000 and Cap Haitien, 14,000.

History.—During 1939 Haitian development was marked by continued economic uncertainty, although with more promise for the future than previously, and by definite progress on numerous projects in the national program of public works, under which several highways under construction were extended, as were irrigation and drainage works. The national agricultural program was marked by the distribution of seedlings of coco-nut, lime, banana, coffee and other plants, with the triple objective of furthering diversification, extending the area under banana cultivation, and improving the quality of coffee, the republic's leading export crop. In the fiscal year ending Sept. 30, 1939, exports were in the main greater in volume, but with proportionately less increase in value. Coffee, increasing 17% in quantity, was valued at but 8% more than in 1938. Cacao exports were 15% greater in volume, but 12% less in value; sisal 4% more in volume, 16% less in value. Banana exports, however, were approximately 30% greater in both volume and value. Cotton, nominally less in quantity, was 16% greater in value. Sugar volume increased by 11%, but was 31% greater in value. War in Europe, while momentarily disrupting Haitian foreign trade, gave promise of eventual benefit.

Education.—Haiti has over 400 primary and secondary schools, with a total enrolment of over 50,000. The University of Haiti

is at Port-au-Prince.

Finance.—The monetary unit is the gourde, fixed by law at 20 cents U.S. The gross public debt on Sept. 30, 1939, was \$10,427,400, against \$8,790,000 on Sept. 30, 1938. Fiscal control is in the hands of a financial adviser nominated by the President of the United States.

Trade and Communication.—External communication is by sea and by air. There are 164mi. of railway and in excess of 1,000mi. of motor highway. Imports for the fiscal year ending Sept. 30, 1939, totalled \$8,180,737 in value, a 7½% increase over the previous year, and comprised textiles, foodstuffs and miscellaneous manufactured goods. Exports were \$7,267,655, a 4% increase, and comprised coffee (51.2%), sugar (14.05%), cotton (13%), bananas (7.8%), sisal hemp (7.44%) and cacao (1.7%). Imports came largely from the United States (62.96%), with Great Britain (13.78%), Germany (5.65%), France (5.12%), the Netherlands and Netherlands West Indies (3.38%), Belgium (2.71%) and Japan (2.38%) next in order. These represented a sharp increase from the United States (55.09% in 1937-38), and nominal declines for Great Britain and Germany. Exports were taken by the United States, 34.73% (43.11% in 1937-38); France, 20.96%; Great Britain, 18.88%; Belgium, 10.29%; Denmark, 5.19%; Germany, 3.14%; and Netherlands, 1.55%. (See also DOMINICAN REPUBLIC.) (L. W. BE.)

Halliburton, Richard (1900-1939?), American author, was born in Brownsville, Tenn., on January 9. He moved to New Jersey in his infancy and attended school there. After graduating from Princeton in 1921, he set out upon a series of planned adventures, which included climbing the Matterhorn, Fujiyama, Olympus and Popocatepetl. His favourite pastime was the duplication of famous feats of history. Like Byron, he swam the Hellespont. He solemnly retraced the travels of Ulysses as recounted in the *Odyssey*. In 1928 he "relived" Cortez's conquest of Mexico and Balboa's march across Darien. Following the path of Hannibal, he rode an elephant from Switzerland across the Alps to Turin. His accounts of these and other exploits were published in *The Royal Road to Romance* (1925), *The Glorious Adventure* (1927), *New Worlds to Conquer* (1929), *The Flying Carpet* (1932), *Seven League Boots* (1935) and other volumes which sold a total of more than 1,000,000 copies. In Feb. 1939, he began a voyage from Hongkong to San Francisco in a Chinese junk. On March 23 his craft is believed to have struck a typhoon west of Midway island and foundered.

Hammer Throw: see TRACK AND FIELD SPORTS.

Hand-ball. Hand-ball, a sport which thrives on actual participation rather than attendance, attracted increased numbers in 1939. Playgrounds, high schools, colleges and other media offer additional facilities yearly to both men and women of all ages. The classic event is the national A.A.U. four-wall championship, held every year. In 1939, the Olympic Club of San Francisco, California, was the host with entries representing every section of the country. The winner in the singles, for the fifth consecutive year, was Joseph Platak of the Lake Shore Athletic Club, Chicago. In the doubles, Edward Linz and Frank Coyle of the New York Athletic Club were the victors for the second year in succession. National four-wall rankings for 1939 are:

Singles

1. Joseph Platak, Chicago
2. Jack Clements, San Francisco
3. Walter Plekan, Buffalo

Doubles

1. Edward Linz and Frank Coyle, New York
2. Joe Gordon and J. L. Goldsmith, Long Beach, Cal.
3. G. Cappel and R. Maguire, San Francisco

There is considerable interest manifested in the one-wall game, which is played almost exclusively in the East. New York city has been the scene of all the national tournaments in this branch of the game and is considered to have the best players in the country.

National one-wall ratings follow:

Singles

1. Harry Michitsch, New York
2. Joseph Garber, New York
3. Harry Goldstein, New York

Doubles

1. George Baskin and Harry Goldstein, New York
2. Morton and Seymour Alexander, New York
3. M. Orenstein and Ben Sheiber, New York

Women's Rankings (one-wall only, New York Metropolitan District):

1. Lucy Caruso
2. Mrs. Blanche Goodman
3. Hannah Singer (Fr. Ro.)

Harper Prize Novel: see LITERARY PRIZES: *United States*.

Harrington, Francis G. (1887-), U.S. commissioner of the Works Projects Administration, was born September 10 at Bristol, Virginia. He graduated from the U.S. Military academy in 1909 and after being commissioned second lieutenant in the Corps of Engineers, served at various military stations in the United States and was in charge of a construction crew during the building of the Panama canal. At the outbreak of the World War he was assistant professor of mathematics at West Point. During the war he was instructor at various officers' training camps, commanded several different regiments, and was in France for a time. Upon his return he was an assistant engineer in charge of maintenance at the Panama canal and was subsequently assigned to the general staff of the War department in Washington. From 1935 to 1938 he was assistant administrator and chief engineer of the Works Progress Administration; on Dec. 23, 1938 he was appointed to succeed Harry L. Hopkins as administrator. In the early months of 1939 he testified several times before a congressional committee in an effort to prevent Congress from reducing the appropriation for relief and applying restrictions to projects of his agency. He and President Roosevelt both dealt firmly with the WPA national strike in July following passage of the relief bill June 30 which imposed a 130-hour month on WPA workers. When the WPA (renamed the Works Projects Administration) was united in 1939 with other agencies into the Federal Works Agency, Col. Harrington remained in charge of WPA operations as commissioner.

Harvard University, oldest institution for higher education in the United States, completed the third year of its fourth century in 1939. At the end of the fiscal year, June 30, 1939, investments exclusive of land, buildings and contents used for educational purposes stood at \$140,185,769. Gifts during the year were \$2,779,718 for capital account and \$1,348,967 for immediate use.

Scholarships and other student aids totalled \$707,329, exclusive of student loans. The year 1939-40 began with an enrolment of 8,379 full time students and a faculty and educational administrative staff of 1,984.

In the undergraduate college, changes were made in the departmental concentration system to overcome dangers of student overspecialization in fields of study; a Bureau of Supervisors for guidance and tutoring was established; and English composition course requirements were stiffened. The central administrative offices of the university, located in University Hall since 1815, were moved to old Massachusetts Hall. The administration adopted a faculty committee report setting up new rules for faculty tenure. Professor George H. Chase was appointed to the new position of

Dean of the university. Professor William S. Ferguson was named Dean of the Faculty of Arts and Sciences and two new assistant deans of the faculty were appointed to strengthen the liaison between university executives and the faculties of arts and sciences on matters of appointment and promotion. A new Committee on Educational relations, concerned with the relations between Harvard and other institutions in the placement of teachers, was established and Dean Henry W. Holmes of the School of Education was named chairman. Francis T. Spaulding was appointed Associate Dean of the School of Education. The university library, largest university library in the world, had 4,079,541 volumes and pamphlets on June 30, 1939, an increase of 136,280 over the previous year.

Hawaii. The Territory of Hawaii consists of a group of eight larger islands and numerous islets in the Pacific ocean between latitudes 18°55' and 22°15' north and between 154°50' and 160°30' west longitude. Their total area is 6,438 square miles. The islands are of volcanic origin. From south-east to north-west, they are Hawaii, Kahoolawe, Maui, Lanai, Molokai, Oahu, Kauai, Niihau. In addition, stretching north-westward beyond Niihau over 1,100 miles is an archipelago of rocks, reefs and shoals which includes Midway (longitude 177°22' west) recently notable as the first stop beyond Honolulu of the trans-Pacific clipper planes. Likewise, 960 miles south of Honolulu and a part of the city and county of Honolulu lies Palmyra, a coral atoll consisting of fifty-five islets, five miles long and two and a half miles wide. The youngest island, geologically, and the largest in the group is Hawaii, with an area of 4,030 square miles.

The capital of the Territory is Honolulu, situated on the island of Oahu. It is a completely modern city with a population (1930 census) of 137,582. Oahu is the scene of the United States' strongest fortifications in the Pacific. Hawaii's population of 368,336 in the 1930 census is estimated at approximately 415,000 in 1939. The racial origin of this population, in addition to the native Hawaiians and Caucasians from the mainland, is Japanese, Chinese, Korean, Filipino, Portuguese. 81% of the population, however, is native born.

Immigration into the Territory except for citizens from the American mainland, has ceased.

The governor and Territorial secretary are appointed by the President. Otherwise the Territory is wholly self-governing. It elects to Congress every two years a delegate who has a voice in the House of Representatives but no vote. The governor in 1939 was Joseph B. Poindexter; and the delegate, Samuel W. King. The Territory collected in taxes and fees \$14,468,991 in 1939 and expended \$14,631,310. In addition, Federal taxes were paid into the U.S. Treasury of \$11,766,650.72, exceeding the payment of 17 States of the Union.

Agriculture.—Hawaii's chief crops are sugar and pineapples. Expert management, scientific methods and costly irrigation works have raised the sugar production to a maximum of 1,035,548 tons in 1933 with a value of \$66,482,181. The value of the 1938 sugar shipments was \$50,743,327. The pineapple industry, next in importance, dropped to 594,561,333lb. with a value of \$38,409,875. Other agricultural crops are coffee, macadamia nuts, papayas and taro, a root used by the natives in making the native "poi" and also now being processed into flour.

The tourist industry has developed rapidly in the last two decades, reaching a total of 50,175 tourist visitors in 1939. One characteristic of Hawaii, unique among all regions under the American flag, is that there are no billboards. (E. GRU.)

HAWAIIAN LEGISLATORS were entertained with hulas at the opening of their 1939 session in Honolulu February 15

Hawthornden Prize: see LITERARY PRIZES: *Great Britain.*

Hay. Supplies of hay in the United States for the 1939-40 feeding season were reported by the Department of Agriculture as 100,000,000 tons, made up of a current crop of 84,000,000 tons and a carry-over of 16,000,000 tons. This compares with a 103,000,000-ton supply of the preceding year, but is 13,000,000 tons larger than the ten-year average (1928-37). Production of all tame hay in 1939 was 75,023,000 tons and 80,299,000 tons in 1938; wild hay, 8,999,000 tons in 1939 and 10,444,000 tons in 1938.

Production of Tame Hay by States, 1938 and 1939

	1939 tons	1938 tons		1939 tons	1938 tons

Health Program, National: see DENTISTRY; MEDICINE.

Heart and Heart Diseases. Three distinct gains have been effected. Most important was the treatment of subacute bacterial endocarditis, often called malignant endocarditis, a fatal disease caused by the *Streptococcus viridans* usually implanted on chronic heart disease of rheumatic or congenital origin. Hitherto recoveries have been excessively rare, variously recorded as from less than 1% to 3%. A recent careful survey of 250 cases studied during the 15 years from 1924 to 1938 inclusive showed only one recovery (0.4%). The disease starts insidiously when a bacterium or a chain of the streptococci floating in the blood stream, as may happen in an otherwise perfectly normal person who has some focus of infection in tooth, tonsil, or other part of the body, becomes implanted on a little clot or thrombus that has become attached to a rough surface or scarred area of the lining of the heart, especially of the mitral or aortic valves of the left ventricle. The streptococcus begins to multiply, if it finds its environment satisfactory, and soon establishes a thriving colony which begins to protect itself from the effect of any antagonistic action of the blood stream around it by a coating of fibrin and blood platelets. The disease spreads, new colonies form on surrounding regions of the lining of the heart valves and chambers and the blood is constantly invaded by the germs that break off from these colonies or still enter the circulation from the original foci of infection. The victim begins to feel sick and feverish, becomes weak and anaemic, and some days or weeks after the disease starts he consults a physician who may at first be puzzled to know what kind of an infection is going on. The presence of old heart disease in a person who is usually still young (the majority of cases are in the two decades from 15 to 35), the finding of the *Streptococcus viridans* by blood culture, certain other signs which are often present (enlarged spleen, clubbing of the fingers and small skin haemorrhages) and the absence of evidence of other types of prolonged infection, such as typhoid and tuberculosis, establish the diagnosis of this dread disease. Fortunately it is not common, making only about 2% of all cardiac cases, attacking one out of every 25 rheumatic heart patients and about one out of every ten congenital heart patients. For about six months on the average (varying from two months to a bit over a year) the patient drifts along to death despite transfusions and all sorts of potent and impotent drugs and other measures. Such was the situation at the opening of 1939. Even sulphanilamide, introduced so successfully in the treatment of certain other serious more acute streptococcus infections, had largely failed. But sulphapyridine was coming in and several recoveries by the use of this drug took place during 1939. The greatest promise of all, however, has come through the experience of Kelson and White in Boston who combined the drug sulphapyridine (an anti-bacterial remedy) with another relatively new drug heparin, an anti-coagulant, which, given intravenously in constant drip, doubtless tends to prevent the formation of the thrombi on the heart valves on which the streptococci grow. These workers report three recoveries in the first seven cases that they treated with these two drugs in combination (one of these cases relapsed after two months but was given another course of treatment). There are dangers from the use of either drug alone and only the greater danger of this fatal disease justifies running the risks of

the treatment. Much more must be learned about the technique of the treatment and about the cases best suited for it (presumably the earlier or milder cases), but for the first time there is some light from the horizon which was previously almost pitch black. Probably also by the skilful use of sulphapyridine during such procedures as the removal of an infected tooth, in a person already affected by some chronic rheumatic or congenital heart damage, this dread disease may be prevented.

The second interesting and important new treatment of heart disease also began in Boston. For years various students of the subject have advised that a certain congenital defect called patency of the ductus arteriosus be corrected by surgical ligation, but nothing was done about it until an unsuccessful attempt was made by Graybiel, Strieder and Boyer in Boston early in 1938. Later the same year, and since then in 1939, Gross of Boston with the medical help of a number of associates, particularly Hubbard, successfully operated on six cases. The ductus arteriosus which in foetal life shunts blood from the right ventricle and pulmonary artery directly into the aorta (instead of through the lungs) normally closes at birth or soon after; if it remains patent, it not only is a hazard because of the possibility of infection by the *Streptococcus viridans*, but, if widely patent, it also increases a good deal the work of the heart and leads to enlargement and heart muscle strain. The third therapeutic measure of special interest is connected with Goldblatt's notable discovery of a few years ago in which he demonstrated that a high (but not complete) degree of obstruction of the circulation to the kidney of an experimental animal by a clamp on the arteries causes high blood pressure during the period of obstruction. It has been found that some instances of high blood pressure in man may arise from a considerable degree of damage to or disease in one kidney and that removal of that kidney may result in a return of the blood pressure to normal. A few notable instances have been recorded, thus calling attention to the need of determining the state of the kidneys in all cases of hypertension.

A helpful development in methods of study of the heart has come with the application of the ingenious device of the lag screen to electrocardiography, allowing the immediate visual inspection of the electrical curves of the heart's action, by the so-called cardioscope, without waiting for the development of the photographic film of the electrocardiogram which can be carried out directly afterwards if one desires to keep a permanent record. Finally, a set of accurate life size models of normal and various kinds of abnormal hearts has been constructed by Spillane which show in particular the relationship of the heart chambers and great vessels to each other and to surrounding structures (spine, oesophagus and trachea) following the original model of Taipale of Finland. These are very helpful for X-ray study and for teaching.

Heath, Lady Mary (1895?–1939), British aviatrix, was born Sophia Mary Peirce-Evans at Limerick, Ireland. Shortly after her marriage in 1927 to Sir James Heath, wealthy British ironmaster, she began a career in flying which lasted scarcely two years but brought international atten-

tion to her exploits. In Oct. 1928 she established a world's altitude record of 24,700ft. for light planes—the highest any woman had ever flown. In 1928 she flew the treacherous 10,000-mi. route from Cape Town to London.

Thereafter she made a tour of the United States, then became a licensed pilot of the Royal Dutch Airlines. Her career as an aviatrix ended at Cleveland, Ohio in Aug. 1929, when her plane crashed through a factory roof and she was critically injured. In 1931 she married George Anthony Reginald Williams, an aviator from the British West Indies. She died after a fall in a London tram on May 9.

Helium. The only commercial sources of helium in the world are the natural gas fields of south-western United States. The Cliffside helium reserve, covering 50,000ac., which supplies the Government-operated helium recovery plant at Amarillo, Tex., has an estimated reserve of 100,000,000,000 cu.ft. of natural gas with 1-8% helium and produced 361,065,000 cu.ft. of gas, while the recovery plant produced 6,099,960 cu.ft. of helium in the fiscal year ending June 30, 1938, an increase of 27% over the preceding year; the estimated cost of production was \$14.25 per 1,000 cubic feet. The bulk of the output is supplied to the army and navy for aircraft use, but during 1938 contracts were made for the sale of 800,000 cu.ft. to private parties. Mixed with oxygen, helium is a valuable substitute for air in the treatment of asthma, laryngitis, croup and diphtheria, as the effort required for the breathing of this mixture is only about half that required for air. The medical consumption during 1938 was about 200,000 cubic feet. The difficulty known as "bends," suffered by divers and caisson workers when coming out of high pressure, is due to the liberation in the capillaries of small bubbles of nitrogen which had become dissolved in the blood under heavy pressure; this may be obviated by the use of a helium-oxygen mixture instead of air, since helium is insoluble in the blood, but as yet the cost of helium is too high to make its use possible under ordinary working conditions. The use of helium for the inflation of toy balloons is being promoted, in order to avoid the liability of injury to children from the explosion of hydrogen-filled balloons.

The substitution of helium for hydrogen in test balloons by the U.S. Weather Bureau will require some 1,500,000 cu.ft. annually.

(G. A. Ro.)

Heller, Edmund (1875-1939), U.S. naturalist, was born at Freeport, Ill., on May 21 and was educated at Stanford university, where he received his bachelor's degree in 1901. While still an undergraduate student he joined the university's zoological expedition to the Galapagos islands and was an assistant naturalist for the U.S. Bureau of Biological Survey in Alaska. From 1901 to 1907, as a naturalist with the Field museum in Chicago, he made explorations in California, Mexico, Guatemala and East Africa. In 1909 and 1910 he was with the Smithsonian African expedition under the direction of Theodore Roosevelt.

In later years he led explorations in many other parts of the world—in Peru, China and Siberia. He was director of the Milwaukee Zoological Gardens from 1928 to 1935 and of the Fleishacker zoo in San Francisco from 1935 until his death. He wrote numerous articles on fishes, reptiles and birds and was co-author with Theodore Roosevelt of *Life Histories of African Game*

Animals. He died at San Francisco July 18.

Hemp. The International Institute of Agriculture at Rome, which normally gives quite comprehensive reports on the output in the principal hemp-producing countries, reported production of only one country in 1939, that of Bulgaria, which produced 14,483,300lb. of hemp fibre, compared to 9,061,000lb. in 1938. The Institute, however, reports the acreage planted to hemp in principal countries in 1939 and 1938. From acreage figures and the known 1938 production some estimate of 1939 production may be made.

Hemp Acreage and Production

	Acreage 1939	Acreage 1938	Production 1938
U.S.S.R	986,000	1,248,000	*
Italy	224,000	225,000	239,487,000lb.
Germany	39,000†	32,000‡	260,000lb.‡
Bulgaria	23,000	25,000	9,061,000lb.
Yugoslavia	141,000	122,135,000lb.
Rumania	120,000	66,790,000lb.
Manchoukuo	80,000	38,422,000lb.
Poland	83,000	28,306,000lb.
Japan	17,000	19,487,000lb.
Syria	12,000	7,637,000lb.
France	9,000	9,231,000lb.

*The latest Russian production reported is the average for 1933-34, which the International Institute of Agriculture recorded as 447,247,000 pounds. The current five-year plan is said to have called for hemp planting of 1,354,000 acres in 1939, but the Institute reported planting of only 986,000 acres.

†Includes Sudetenland and Austria.

‡Does not include Sudetenland and Austria.

(S. O. R.)

Heredity. The application of a recently developed statistical technique has led Burks to report the first case of autosomal linkage in man. The characters concerned—hair colour and a tooth defect—are not themselves capable of simple genetic analysis, but the data indicate that they are dependent in part on linked genes.

The ability to taste phenyl thio urea has been known for some time to be inherited as a simple dominant in man. It has also been known that tasters constitute about 70% of the population, with no marked difference in the frequency in the various races tested. Fisher, Ford and Huxley have now shown that approximately the same relative numbers of tasters and non-tasters occur also in chimpanzees. Irwin and his co-workers have continued their studies of specific antigenic properties in the red blood cells of hybrid doves and pigeons. They have shown that the pairs of species studied differ in a series of separately inherited antigens, and that each antigen is inherited as a simple dominant. Extensive studies show that some of these antigens are present in other related species. These studies are furnishing a solid foundation for the application of serological techniques to the problems of phylogenetic relationships. It also seems likely that the antigens concerned are rather direct gene products. Studies in this field may be expected to throw much light on the nature of development and of mutation.

Little has reported that the frequency of spontaneous tumours is much higher in hybrids between ordinary house-mice and the oriental *Mus bactrianus* than in either parental strain. This result seems likely to furnish a new starting point in the study of the inheritance of spontaneous cancer. Another result of crossing has been recorded in *Drosophila pseudoobscura*, where Sturtevant has shown that the crossing of two semi-cross-sterile races leads to a marked increase in mutation frequency.

Older work showed that the frequency of mutations induced by X-rays is proportional to the dosage. Several investigators have now studied the dosage relations for chromosome breakage, and have shown that two types may be distinguished—"one-hit" aberrations, due to a single ionization, and "two-hit" aberrations,

due to two separate ionizations. The former, like mutations (many of which are in fact due to chromosome aberrations), show a linear relation to dosage. The latter increase with dosage in approximately an exponential manner. A complication here is that, when a chromosome is broken, the broken ends commonly fuse—either to restore the original arrangement or with other broken ends. If the original composition is reformed, as in the first case, no visible aberration results. In the second case an aberration may be detected. It follows that the results will depend on the number of breaks present in a cell and on their distribution in time and space. The time element has been studied by Sax, who finds that, in *Tradescantia* microspores, broken ends may remain open and capable of reunion for about an hour.

Another X-ray result has been reported by Kaufmann, who finds that breakages are not distributed at random in the X chromosome of *Drosophila*. (See GENETICS.)

Highways: see ROADS AND HIGHWAYS.

Hiranuma, Kiichiro (1867–), Japanese statesman, was born September 28 at Okayamaken, the son of a samurai. He was educated at the law college of Tokyo Imperial university, where he graduated in 1888. Some two years later he was a judge in the Tokyo court of appeal, and in 1906 he became director of the Bureau of Civil and Criminal Affairs. In 1923 he was appointed minister of Justice. The next year he was nominated peer, and in 1926 he was created a baron. On Jan. 4, 1939 he was named premier to succeed Fumimaro Konoye. His foreign policy, like that of his predecessor, was based on strict adherence to the anti-Comintern pact and friendship for Germany (see JAPAN). It was all discredited in one blow by the Nazi-Soviet pact of non-aggression. He resigned August 28 and was succeeded by Nobuyuki Abe (q.v.).

Hispanic America: see LATIN AMERICA.

Hispanic America and the European War.

When the war against Hitler began in Sept. 1939, the 20 Hispanic American republics found themselves faced with economic disruption, and threatened with possible involvement in the conflict itself. German steamship and air transport lines shut down their service in the Western Hemisphere, while British and French shipping activity was considerably curtailed and functioned under irregular and secret schedule. Under such circumstances the Hispanic American republics were threatened with loss of markets and deprival of needed supplies. They therefore saw a need for unity of action, and, accordingly, at the suggestion of Argentina, Colombia, Cuba, Mexico, and Peru, along with the United States, President Juan Demóstenes Arosemena of Panama put into motion the machinery created at the Pan American Conference at Lima in Dec. 1938, that is, the provision for joint consultation of the foreign ministers of member states of the Pan American Union in the event of common danger. On September 4 he formally invited the representatives of the 21 member republics to meet in conference at Panama. The announced agenda included consideration of measures to keep the American continent free from the European conflict, and programs for preserving the commercial and financial interests of the several republics, as well as discussion of measures for the maintenance of strict neutrality within their territorial limits.

On September 23, representatives of all the American republics met at Panama in what came to be known as the Panama Conference. By that time, however, consideration of defence meas-

ures took precedence over all other points under discussion, due to rumoured activity of both surface and underwater belligerent craft in American waters, and to the Russian invasion of Poland. After nine days of both public and private discussion of possible courses of action, the Conference approved (October 2) the Declaration of Panama, under which the American nations proclaimed a broad safety zone in American waters for inter-American shipping, and made a general declaration of neutrality in the European conflict. The zone began at the United States-Canadian border on the Atlantic and covered the shipping lanes of the entire American continent, extending northward along the Pacific coast to the United States-Canadian border. In the Pacific it was broadened to include the Galápagos islands, while undisputed possessions of European states were excluded. Among the provisions of the neutrality proclamation were: acknowledgment of individual decisions on the admission of undersea craft; establishment of two permanent committees, one of seven international law experts to determine violations of neutrality, the other of 21 delegates to discuss economic and financial problems arising out of the war; opposition to contraband lists; provision for uniform standards of neutrality. On October 4, the participants in the European conflict were formally notified of the declaration and asked to respect the neutrality of the individual nations.

Subsequent to the Panama Conference, the Inter-American Fiscal Conference was held in Guatemala in November, and the Inter-American Financial, Economic, and Advisory Council at Washington in the same month. Their general objectives were the adjustment of economic and financial problems of the several American republics arising out of the economic dislocation of the war. No formal decisions and conclusions had been announced by the close of the year. Meanwhile, in December, the international law committee (comprising members named by Argentina, Brazil, Chile, Costa Rica, Mexico, Venezuela and the United States) began to sit at Rio de Janeiro. Hardly had its meetings begun when it was faced with the problem of the violation of the safety zone in the battle of Punta del Este, off the Uruguayan coast, in which three British cruisers defeated the German pocket battleship "Graf Spee." The "Spee's" flight to Montevideo compelled Uruguay to impose a time limit on its stay there, with the alternative of internment, despite German protests. Her subsequent departure and scuttling by her own crew in the mouth of the Rio de la Plata and arrival of the crew in Argentina gave that nation the necessity of interning the crew, again over German protest. The German steamer "Tacoma," which had served as an auxiliary to the "Graf Spee," was likewise ordered interned in Uruguay. Concurrently, seizure of the German steamer "Dusseldorf" 12 mi. off the Chilean coast and other, similar seizures caused resentment at the disregard of the safety zone. A joint protest of all the American republics at the violation of the neutrality zone in the battle of Punta del Este was delivered to the belligerents.

The several Hispanic American members of the League of Nations, led by Argentina, took the initiative in forcing the expulsion of Russia from the League (December 14) as a result of her attack on Finland. Trade effects of the war by the close of 1939 were, notably, the practical cessation of a German trade which had represented 17% of all Hispanic American foreign trade in 1938, the diversion of British and French shipping, with heavy increases in purchases of certain products, notably meats from the Plata republics and Brazil, and tin from Bolivia, and a heavy increase in neutral trade, especially by the United States and Japan. Politically, Western Hemisphere solidarity was more nearly a reality than ever before. (See also EUROPEAN WAR.)

Hitler, Adolf (1889–), German statesman, was born at Braunau on the Inn in Austria on April 20. After residence in Vienna where, as a painter, he formed his anti-Marxian and anti-Semitic convictions, Hitler moved to Munich in 1912. Here, in Aug. 1914, he enlisted as a volunteer in a Bavarian regiment and fought throughout the World War. In July 1919, at Munich he joined as "Number 7" Anton Drexler's German Workers' Party, which soon developed into the National Socialist German Workers' Party, popularly known as the Nazis. Herr Hitler quickly became its Leader (*Fuehrer*) and for a time edited its official newspaper, the *Völkischer Beobachter*. In the so-called Munich Beer Hall Putsch of Nov. 9, 1923, Hitler attempted with Ludendorff, Goering, Frick, Streicher, Roehm and others to seize the Bavarian Government, but was arrested, tried for treason, and condemned to imprisonment at Landsberg. Here he dictated to his secretary, Rudolf Hess, his famous book, *My Struggle* (*Mein Kampf*), of which more than 2,500,000 copies were later sold, thus providing the author with an abundant income. It is in part an autobiography and in part an exposition of his ideas for the regeneration of Germany, and is hence sometimes called the "Nazi Bible." On his release from prison in Dec. 1924, as a result of a general amnesty, he devoted himself to building up various organizations to strengthen the Nazi party: Brown Shirts, Elite Guard (*Schutz-Staffeln* or "SS"), Hitler Youth (*Hitler Jugend*) and other formations. With the aid of these, with efficient lieutenants, and with his magnetic oratory, his Nazi party grew rapidly in power, winning 12 Reichstag seats in 1928 and 230 in July, 1932. On Jan. 30, 1933, Hitler was appointed Reich Chancellor and began the social and political revolution establishing the "Third Reich." Upon Hindenburg's death on Aug. 1, 1934, Hitler succeeded him as president, but modestly refrained from using the title and is known simply as Reich Leader (*Fuehrer*) and Chancellor. For events in Hitler's career from 1934 to 1939 see GERMANY. (S. B. F.)

Hockey: see ICE HOCKEY.

Hogs. War and the largest world supply of vegetable and animal fats and oils on record affected hog production and prices in sharp diversity in different countries in 1939. Early in the war the United Kingdom contracted with the Canadian Government to maintain a large and staple supply of hams and bacon for Great Britain, at fixed prices advantageous to producers. In the Danube basin apparent competition between Germany and Italy to obtain pork products operated advantageously to growers. But in the United States average prices of hogs per head were \$7.79 when the Agricultural Department's annual livestock estimate was made Jan. 1, 1940, whereas a year earlier the price was \$11.21 per head. The number of hogs on U.S. farms Jan. 1, 1940, was 58,312,000, compared to 49,293,000 head Jan. 1, 1939. But the total value Jan. 1, 1940, was \$454,280,000, compared to \$552,626,000 a year earlier. Thus with 8,919,000 more hogs Jan. 1, 1940, the total value of all hogs was \$98,346,000 less. While lard exports increased in 1939 over 1938 their volume was scarcely sufficient to affect hog prices in the United States. The fall pig crop in 1939 (June 1 to December 1) was 31,985,000 the largest in 16 years of record and comparable to 27,651,000 in 1938. The total pig crop in 1939 (spring and fall) was 84,302,000 compared to 71,101,000 in 1938 and a ten-year (1928–37) average of 71,752,000. Department of Agriculture economists believe the 1939 high production marks the end of the upward swing in hog num-

bers that began in 1938, and that spring farrowing in 1940 will approximate or be slightly under that of 1939. Slaughter of hogs under Government inspection in the United States was 36,131,404 the first 11 months in 1939 and 31,840,331 in the same period in 1938.

Hog numbers in other countries in 1939 and 1938 were:

	1939	1938		1939	1938
Canada	4,294,000	3,486,900	Yugoslavia	..	3,450,884
United Kingdom	4,390,100	4,383,100	Lithuania	1,117,080	1,093,120
England & Wales	3,510,100	3,564,300	Bohemia-Moravia		
Northern Ireland	627,100	561,500	Protectorate	1,607,191	1,949,034
Scotland	252,900	257,400	Belgium	960,372	871,556
Germany	22,482,654	20,806,304	Latvia	891,470	813,500
Hungary	3,885,643	3,110,160	Switzerland	880,000	922,807
Denmark	3,230,000	2,706,000	Netherlands	1,553,418	1,537,783
Czecho-Slovakia			New Zealand	683,000	756,000
(Jan. 1, 1939)	2,082,733	2,523,988	France	..	7,127,000
			U.S.S.R.	..	30,600,000
			Sweden	..	1,371,000

The foregoing figures are from Government sources and the International Institute of Agriculture. (S. O. R.)

Holland: see NETHERLANDS.

Home Building, Federal: see FEDERAL HOME LOAN BANK SYSTEM; HOUSING.

Honduras, a Central American republic; language, Spanish; capital, Tegucigalpa (pop. 35,000); President, General Dr. Tiburcio Carias Andino. The area is 46,332 square miles. The population was officially estimated in 1935 at 962,685 and unofficially at approximately 1,000,000 in 1939. In 1939 the economic situation continued difficult, although the total production of bananas was somewhat increased. During the year attention was given to proposed large-scale production of hemp, a product hitherto produced only experimentally.

In Jan. 1939 congress repealed the 1937 law creating a differential customs tariff for certain countries, and, at the same time, imposed a 50% duty on the products of some countries, principally those of Japan. External communication is by steamship and Pan American Airways. Airlines connect Tegucigalpa with the coast. Honduras has approximately 600mi. of railway and 280mi. of inter-coastal highway, with a recently-completed 90mi. stretch of the Inter-American highway. Foreign trade in 1937–38 showed a substantial decrease in exports, although the volume of imports declined only slightly. Imports in 1937–38 totalled \$9,467,388; exports (chiefly bananas, with some gold) aggregated \$7,356,388. The greater part of the foreign trade is with the United States. The monetary unit is the lempira (value \$.50 U.S.). The 1939–40 budget called for a total expenditure of 11,403,000 lempiras, a slight reduction from the previous fiscal year. According to the last official estimate (1936) there were 965 elementary schools with 33,461 pupils out of 80,000 of school age. There are 93 secondary schools (2,857 enrolment), and two normal schools. The Central university is at Tegucigalpa. (L. W. BE.; C. N. G.)

Hops. Production of hops in the United States in 1939 was 38,570,000lb. as against 35,261,000lb. in 1938.

The yield per acre for the United States was 1,236lb. in 1939

	1939 lb.	1938 lb.	1928–37 average lb.
Oregon	19,400,000	16,434,000	18,352,000
California	10,350,000	9,152,000	8,695,000
Washington	8,820,000	9,675,000	7,032,000

and 1,119lb. in 1938. The yield per acre in Washington was 1,800lb. in 1939 and 1,935lb. in 1938; in California, 1,500lb. in 1939 and 1,366lb. in 1938; in Oregon, 1,000lb. in 1939 and 830lb. in 1938. Owing to the war, detailed figures on the European hop crop are not available, but reports are that 1939 production approximates that of 1938. Although acreage is smaller the German Brewing Industrial Association estimated the crop as about that of 1938 since hop yards abandoned were marginal areas of low yield. The crop in Yugoslavia was estimated at between 5,500,000lb. and 5,700,000lb. in consular reports. In the protectorate of Bohemia and Moravia the 1939 crop was reported as 9,900,000lb. compared to 7,738,000lb. in 1938. The 1939 acreage in the United Kingdom was reported as 18,800ac. compared to 18,500ac. in 1938. (S. O. R.)

Hormones: see CHEMISTRY, APPLIED; CHEMOTHERAPY; DENTISTRY; ENDOCRINOLOGY; GYNAECOLOGY AND OBSTETRICS; MEDICINE; PHYSIOLOGY; PSYCHOLOGY; STERILIZATION; SURGERY; UROLOGY.

Horse Racing. During 1939 new records were established in the United States in numerous different departments of turf affairs. Racing being now a year-round sport it proceeds continuously from January 1 to December 31, allowing only for the Sabbath intermissions—while at New Orleans during the winter and just over the border at Agua Caliente, Mexico, it proceeds on that day as well. It is therefore no wonder that the previous top figures for the number of days of racing, the number of races run and the amount of money distributed in stakes and purses were all displaced by new ones.

In money, \$15,312,189 was paid out to the owners, trainers, breeders and riders of winning horses, as against \$14,946,609 in 1938; the number of races run rose from 16,250 (1937) to 16,966; the number of days of racing from 2,140 (in both 1937 and 1938) to 2,199. These increases were registered without any increases in the number of different race courses already existent, for the year saw no new ones of importance thrown open. They were due to expansion at the established plants and indicated a corresponding increase in the success attending them. As previously recorded, this success has been the result of the legalization, now nationwide, of race-track betting and the supervision of all recognized meetings by State racing commissions created for the purpose by the different commonwealths. This betting, done through the machines ("totalizators") devised for the purpose, produces most of the revenue from which the upkeep of the meetings and the taxation paid into the State treasuries is derived. Up to the end

JOHNSTOWN CROSSING THE FINISH LINE of the 65th Kentucky Derby May 6, 1939, ahead by six lengths

of 1939 the totalizators had not been installed at any of the New York tracks, where the old-fashioned "book-making" system of wagering prevailed. But in the fall of 1939 a referendum, in the shape of a poll of the electorate, was held and by a decisive majority the adoption of the machines was voted. They are expected to be in operation in 1940.

The leading winning owner of 1939 was William Woodward, of New York, whose Belair Stud Stable won \$284,250, the largest sum of the kind amassed since 1935. This was due chiefly to the fact that Mr. Woodward owns two of the year's outstanding horses, Johnstown and Fighting Fox, which between them earned over \$200,000. Johnstown took the Kentucky Derby, the Belmont, Withers, Dwyer and other great stakes and Fighting Fox the \$50,000-added Massachusetts Handicap. Second on the list was Charles S. Howard, of San Francisco, whose stable won \$246,900; while third was W. L. Brann, of Maryland, with \$222,545. During the season the stables of ten different owners won \$100,000 or more.

At the close of the campaign the three-year-old colt Challedon, bred and owned by Mr. Brann, was both critically and popularly hailed as "the Horse of the Year." Starting in 15 races and winning 9, he earned \$184,535, placing him at the top of the list. His rivalry with Johnstown during the early part of the season, in the great three-year-old events, and thereafter with the four-year-old Kayak II in the all-aged ones, were the most memorable features of 1939. In four meetings with Johnstown he won twice, while he beat Kayak in both their clashes. Kayak, owned by Mr. Howard, was bred in Argentina and imported untried into this country when three. In March he won the \$100,000-added Santa Anita Handicap, which he followed with another victory in the \$50,000-added Hollywood Gold Cup. Then brought East, he disposed of everything he met except Challedon, their final meeting to decide the championship taking place at the Pimlico track, Baltimore, Md., on November 1, when after a hard and very close race Challedon defeated him by half a length. Kayak won 8 of his 11 starts and \$170,875.

The season was also notable for the appearance of what was believed to be the best two-year-old seen in a long while. This was Bimelech, bred and owned by E. R. Bradley, of Kentucky, who was undefeated, winning 6 straight races and \$135,090.

Harness Turf.—The season of 1939 was extremely successful and marked a further return to large popularity of this peculiarly American type of horse racing. The "Horse of the Year" continued to be the grey gelding Greyhound, owned by E. J. Baker, of St. Charles, Illinois. He made no formal attempts to lower his championship mile record of 1:55½, made in 1938, being used for other purposes, but showed his accustomed prowess. When sent against the two-mile record of 4:10¼ he lowered it to 4:06. When hitched double with Rosalind (1:56¾), the champion mare, the two first lowered the record for pole-teams from 2:03¼ to 1:59, and subsequently to 1:58¼. Similarly, the pacing champion, Billy Direct (1:55), owned by Messrs. McConville and Downey, was not sent against his best mile record, but was started to beat the half-mile track record, which he reduced from 2:01 to 1:59½.

In the competitive arena the bold figure was the three-year-old colt Peter Astra, owned by Dr. L. M. Guillinger, of Andover, Ohio. He won all the principal stakes for the age, 9 in number, without defeat, and earned in excess of \$45,000. (J. L. HE.)

Great Britain.—The flat racing season of 1939 will be remembered chiefly as revealing one of the greatest colts in turf history. This was Blue Peter, whose four victories in Lord Rosebery's colours included the Two Thousand Guineas and the Derby.

The outbreak of war was responsible for the suspension of racing from September 3 to October 18, when it was resumed at Newmarket. A skeleton program was then arranged which included

substitute races for such normally important events as the Cambridgeshire, the Cesarewitch and the Manchester November Handicap.

The St. Leger had to be cancelled, but there is little doubt that Blue Peter would have won the last of the year's classic races, and so joined the select band of horses who have won what is known as the Triple Crown. As it was, the stake money won by this great colt amounted to £31,964, and it enabled Lord Rosebery and his trainer, J. L. Jarvis, to head the lists of winning owners and winning trainers respectively. An American owner, R. S. Clark, won the One Thousand Guineas and the Oaks with his French-bred filly, Galatea II, trained at Manton by J. Lawson.

The best of the two-year-olds was Tant Mieux, but he was beaten in the Middle Park Stakes by M. M. Boussac's colt Djebel, sent over from France after the war had begun.

A feature of the season was the success gained by Lord Carnarvon with five yearlings he had purchased the autumn of 1938 at the Saratoga sales. Four of the five won races.

Gordon Richards was champion jockey for the 13th time in 14 years with 155 winners. He has now ridden 2,586 winners during his career. The King's jockey, J. Crouch, was killed in an aeroplane disaster on his way to the Newcastle races in June. A new totalization record was set up when the machine took £61,608 on the Derby. The Grand National was won by the Irish horse, Workman, owned by Sir Alexander Maguire. (A. K. B.)

Horses. In anticipation of a huge war demand for draft animals, as in 1914 at the outbreak of the World War, prices for horses and mules in the United States rose sharply in Sept. 1939, but by November had dropped back to almost August levels. No war demand had developed up to Jan. 1, 1940, owing to the extensive motorization of European armies and owing to the war having assumed a static quality along the French Maginot and the parallel German Siegfried lines. Germany for three years had been building up reserves of horses and mules by purchase from nearby countries. Great Britain and France drew on farm horses for immediate army needs as the 1939 crop season was about over. Should the war develop movement, with a break through or around the heavily fortified Maginot and Siegfried lines, it is believed there will be a demand for horses and mules from the United States and Canada, the most available source of supply for Great Britain and France. In the autumn of 1939 foreign military officers investigated the supply of cavalry as well as artillery horses in the United States. Military authorities point out that the wars in China, Spain and Ethiopia demonstrated that tanks, trucks and aeroplanes have not entirely displaced the need for horses and mules, especially over muddy terrain.

The horse population in the United States declined about 700,000 to 10,400,000 in 1939 and mules from 4,307,000 in 1938 to about 4,250,000 in 1939 owing chiefly to further increase of tractors on farms. These estimates are by Wayne Dinsmore, secretary of the Horse and Mule Association of America, long a nationally recognized authority. (See LIVESTOCK for the Agriculture Department's estimate of the number of horses and mules on United States farms as of Jan. 1, 1940, and for the numbers in other countries in 1939.) During the first six months of 1939 the Horse and Mule Association of America conducted a nationwide educational campaign, and about 1,500,000 horses were vaccinated against sleeping sickness (equine encephalomyelitis). The loss in 1939 was small. (See also LIVESTOCK; SHOWS; VETERINARY MEDICINE.) (S. O. R.)

Horticulture. Europe's war began to affect horticultural activities in many parts of the world almost as soon as hostilities commenced. Holland was among the first of the

continental countries to encounter these effects, for England immediately cancelled hundreds of orders for tulip bulbs and other Dutch bulbs. English growers being Holland's largest customers, this was an economic blow. Fortunately, most of the bulbs destined for the United States were en route or had been delivered. The Netherlands Government then announced rather severe restrictions, largely reducing the planting area, in the conviction that shipments in 1940 might also be curtailed to a large extent. This fact will have an important effect on the florists' trade in the United States. It is quite true that a large industry in the growing of daffodils has been built up in the North-west and in other sections, but the production of tulip bulbs in America is very limited. Probably not more than one-fifth of the millions of tulips planted each year in the United States are grown on the American continent. However, this industry has been developed to fairly large proportions in Michigan and elsewhere, and growers have been encouraged to increase their plantings in anticipation of a wider market.

It is felt in the trade, however, that a serious shortage of tulip bulbs will be experienced in 1940, and a less severe shortage in narcissi, hyacinths and other Dutch bulbs. Of course, all other countries which use these bulbs will be in the same situation.

Another shortage, resulting from the war, began within a few weeks. Lilies-of-the-valley are flowers which can be used by florists the year around, inasmuch as their forcing is a simple matter. Most of the bulbs ("pips," in the trade) come from Germany under normal conditions and are especially prepared for forcing. Naturally, the importation of these bulbs almost entirely ceased soon after the war started. A very limited source of supply has been developed in the United States.

Several million bales of dried peat, usually spoken of as peat moss, are used in the United States each year. Large quantities are also used in other countries. Coarse grades are commonly purchased by poultrymen and farmers to provide scratch litter in poultry houses and bedding for farm animals. Finer grades are used extensively by nurserymen, florists and amateur gardeners for improving the soil and for mulching plants. In recent years, a very large business has been done in the importation of peat from Germany, Holland, and Sweden. This business was cut off almost immediately when the war began, because peat is bulky and therefore requires an undue amount of shipping space. The scarcity of imported peat seems likely to build up a peat-producing industry in the United States, although little machinery for drying and processing the peat was on hand, when this situation presented itself. The rapid drying of the peat is a particularly difficult problem to solve. There are, however, immense beds of excellent peat in various parts of the U.S., and the industry has been growing in Michigan for several years. Maine, among other States, has extremely large peat deposits, and a product called Florida humus is being produced in a fairly large way in Florida.

The eastern part of Canada, particularly Nova Scotia, has extensive apple orchards and under normal conditions a large part of the crop is shipped to England. The autumn of 1939 found this market greatly reduced, and Canadian apple growers had difficulty in disposing of their crop at satisfactory prices. Great quantities of apples were placed in cold storage in anticipation of a better market in the spring of 1940. The Canadian situation was reflected somewhat in the United States, depressing the market.

Naturally, ornamental horticulture was largely wiped out in war-torn Europe within a few weeks after hostilities commenced. This was made especially evident in England, where the famous Kew Gardens, as well as the Royal Horticultural Society's Wisley Gardens were promptly taken over for military use in anticipation of air raids. They offered a particularly good opportunity for the installation of anti-aircraft guns. Many of the valuable books

THE "WORLD'S FAIR ROSE," which received first award in the 1940 All-America Rose Selections, Floribunda classification, is a rich-red flower of 20 petals

and paintings of the Royal Horticultural Society in London were removed from the society's buildings to places of safety outside the city. Plans for the great Chelsea Flower Show and other exhibitions were promptly cancelled. This is a picture which seems to be duplicated throughout the British isles and, of course, in France, Germany and other countries subject to wartime threats. An attempt was made to maintain to some degree the growing and distribution of flowers, especially in England, as an antidote to the war fever. However, florists were fearful that bombs might bring destruction to the many acres of glassed-in gardens in the tight little isle.

Perhaps the most significant advance in the United States in 1939 was the growing use of chemicals and drugs in plant cultivation. Much attention has been given to the use of colchicine to increase the size of flowers and fruits. This is a drug which has long been used by medical practitioners for rheumatism and gout. It seems to have magical effects on certain plants, but its use is purely experimental. The growing of plants by chemical nutrients and without soil has passed out of the sensational stage and is being put to a practical test in many green-house estab-

lishments. The fact seems to be pretty well settled that certain flowers—roses and carnations, in particular—can be grown cheaply and advantageously in gravel on green-house benches, when fed the proper chemical fertilizers. This phase of horticulture is still confronted, however, with many problems.

Much has been written of late about the rapid increase in dangerous pests with which horticulturists have to deal. The Japanese beetle is a particularly obnoxious pest throughout the Eastern States, and fear is expressed that pests of this type may eventually get wholly out of control. This is not likely to happen, however, although it is true that the balance of nature has been completely upset by civilized modes of living. Destruction of birds and other wild creatures has done much to lessen nature's ability to deal with pests and a very serious attempt is being made by several organizations and by the Government to restore and maintain wild life, wherever possible. However, greater dependence is being placed upon insecticides, the production of which has grown to such an extent as to reach a business running to \$100,000,000 annually, based on retail sales in the United States. This includes the control of insects affecting stored crops and other products, as well as those growing in fields or orchards. Commercial aeroplane dusting has been developed rather widely in cotton-growing sections. This plan has possibilities in the protection of forest trees.

For several years test gardens have been maintained in different parts of the U.S. for trial plantings of new annuals. The annual flowers, which receive the greatest number of votes from a jury, are called All-America selections and receive considerable publicity on that account. A similar competition for roses is now to be instituted. Rose test gardens have been established and judges named. As a preliminary, several new roses were passed upon late in 1939, one of the roses chosen being World's Fair Rose, which was seen by thousands of visitors at the New York Fair. There is one result of the long-continued depression, which has had a profound influence on horticulture on both sides of the water. High taxes and reduced incomes have compelled the owners of large estates to close them or to greatly curtail the number of employees. This fact has thrown many competent gardeners out of work and many of them are not likely to obtain new positions comparable to those which they have occupied in the past. The same causes have seriously affected landscape architects, inasmuch as few large places are being laid out. In the end, however, this probably will have a beneficial effect on landscape work in general by bringing about a tendency to give more attention to small places and by making it possible for amateurs to obtain the advice of landscape architects at a reasonable fee. (E. I. F.)

Hospitals. The major development of concern to hospitals has been the outbreak of war. While it has most seriously affected hospitals in the strategic centres involved and to a great extent all hospitals in the countries involved, it has also had definite effect on the hospitals in many neutral countries, owing to the cutting off of supplies and equipment from belligerent or other neutral countries. Hospitals in the capitals of the warring nations have had to make elaborate preparation against attack: subterranean bomb-proof shelters for patients and personnel, in some instances with emergency operating units and case rooms; decontamination units; sandbagging of roofs, windows and entrances; the training of nurses to combat incendiary fires; camouflaging of exposed buildings, enrolment of volunteer and other auxiliary aids. The evacuation of civilian patients from London, for instance, was a major undertaking; some 104 hutment hospital schemes, with 1,037 huts providing 38,120 beds, were

erected in southern England to supplement the other local hospital beds taken over for these evacuated patients. On the Thames a number of hospital vessels staffed by doctors and nurses were on patrol to rescue and give first-aid to people rescued from the river or its banks during air raids. In France a 5,000-bed hospital for air raid casualties was erected a few kilometres from Paris. Of serious concern has been the dislocation of the personnel of hospitals due to enlistments, etc. Financial readjustments have been extensive. In London one bright spot has been the closer relationship between governmental and voluntary agencies.

Hospital Construction.—Apart from war construction in Europe, the most extensive hospital construction in 1939 was in Latin America.¹ Fine new up-to-date hospitals have been erected at Lima, at Buenos Aires, at Havana, in Caracas, Rio de Janeiro, Sao Paulo, and many other centres. A modern medical centre, including a hospital, a school of nursing and a medical school, has been completed at Jerusalem, and fine buildings have been erected at the American university at Beirut. One of the largest and most modern groups to be built in Europe is the recently built Louis Pasteur hospital at Colmar, France. This 600-bed hospital is placed diagonally across a square site, the corner in front being occupied by the administration unit and the corner behind being allocated to the tuberculosis building. The five-storey main building is divided vertically into services on the assumption that vertical transportation is easier than horizontal. The New Westminster hospital in London is the latest British construction.

Hospital Care and Other Insurance.—Much progress in voluntary hospital service plans has been made in the United

¹Aristides A. Moll, "Hospital Development in Latin America," *Hospitals* (Chicago) XIII-11, Nov. 1939.

THE WORLD'S LARGEST CANCER INSTITUTE, Memorial hospital, was opened June 14, 1939, in New York city

States. The approval of plans by the American Hospital Association has done much to eliminate the unsound, profit type of plan. The outstanding development of 1939 was the setting up of a research service to analyze financial and statistical returns, to make studies of comparable financial and actuarial experiences and to develop uniform methods of accounting, statistical terms, and definitions. Though under the Council on Hospital Service Plans of the American Hospital Association, this research program is supported exclusively from special assessments on the various plans. In Great Britain the King Edward's Hospital Fund of London set up a new plan for low income individuals, giving full hospital maintenance with medical and specialist care as well as various other benefits. In Canada, the Associated Medical Services, Inc., sponsored by the medical profession gives general practitioner, specialist, hospital, and nursing coverage.

The Administrative Field.—Several studies of wide international interest have been published by the International Hospital Association. These include studies of public relations, construction, equipment, power and heating, transportation, and training in administration. The American Hospital Association committees have made special studies of tuberculosis in general hospitals, insurance coverage, and hospital nursing costs.

Legislation.—The comprehensive health insurance plan introduced into New Zealand providing medical, hospital and other benefits has encountered considerable delay due to the strong opposition of the medical profession to the maternity bonus provided. In the United States the postponement of the Wagner National Health Act, unsatisfactory from the viewpoint of hospitalization, has delayed for the present the implementation of the Federal Government's National Health program. The American Medical Association also won its appeal from a Federal grand jury indictment charging it with violation of the anti-trust laws by alleged interference with the participation of doctors and hospitals in a Washington, D.C., hospital insurance scheme. The appeal court ruled that the practice of medicine, being a profession, did not come under these laws.

Hospital Organization.—The Congress of the International Hospital Association, scheduled for Toronto, Canada, was cancelled with the outbreak of war. The headquarters may be transferred from Germany to Switzerland. At the American Hospital Association convention tentative plans were made for a Pan-American Hospital Congress. An Italian Hospital Association has been formed uniting the former separate unions of the various hospital workers. The Italian Government has put all hospitals under a new code of laws, linking the hospitals with public health activities, the director also acting as local medical officer of health. In Northern Ireland an extensive survey has been made of all hospital facilities. (G. H. Ag.)

Housing. Public housing in the United States, nationally and locally, achieved rapid and, on the whole, solid progress during 1939. For residential construction by private enterprise, see BUILDING AND BUILDING INDUSTRY. The large initial program advanced from survey and planning to construction stage and in some cases to occupancy.

The program provides about 30,000 dwelling units in addition to those cited on p. 346 as under loan contract. In the United States Housing Act of 1937 and its 1938 amendments, Congress had authorized the United States Housing Authority to lend local public housing authorities a total of \$800,000,000, covering 90% of the cost of local projects to clear slums and build housing for families in the lowest income group, inferentially the ill-housed third of the nation. (In particular communities, the ill-housed group may obviously form either more or less than a third of the population.) To bring rents within reach of the ill-housed

group, the Act authorized USHA to make annual contributions totalling \$28,000,000, matched by local contributions of at least a fifth as much. Usually taking the form of tax remission or exemption, these local contributions are probably worth more than the required minimum. To assure continuity for the program, the Senate passed a bill in 1939 making available another \$800,000,000 for loans and \$48,000,000 for additional annual grants. The bill was still pending in the House Jan. 1, 1940. It reserves \$200,000,000 for rural housing loans and provides for home purchase by agricultural workers.

During 1939, five more States passed enabling acts, making a total of 38. The number of local housing authorities rose to 281. Many of them have already acquired valuable experience and built up efficient staffs. Regional conferences, as well as national, encourage the sharing of this experience.

Nineteen State supreme court decisions have now been rendered affirming the constitutionality of public housing and slum clearance State laws.

The process of decentralization implicit in the U.S. Housing Act was materially aided by the establishment in Sept. 1939 of seven regional offices, each headed by a regional director, with whom local authorities deal instead of far-away Washington. The decisions which a regional director is empowered to make have been increased, and this process is expected to continue. On the other hand, the number of points requiring USHA approval, even delegated to a regional director, is expected to diminish as procedure is standardized.

Technical talent of USHA and of the local housing authorities has been concentrated until recently on reducing construction cost per dwelling unit without sacrificing essential standards. In spite of the skeptics, a large measure of success has been achieved. Average net construction cost per dwelling unit in the 145 projects under contract is \$2,831, and average total development cost, including land, utilities, landscaping and non-dwelling facilities is \$4,867.

In all cases until recently the maximum subsidy has been granted with the idea that minimum income families could not be reached without it. But with more and more contracts awarded and with the early projects already tenanted, it is found that in most cases the rents are fully as low as they ought to be. Families on relief are not excluded. Further reductions in rent would tend to exclude every one else and eventually to turn the projects into institutions for problem families. A new policy has, therefore, been adopted. Maximum subsidy in future contracts will be granted only in exceptional cases.

The next major economies will be sought in management and maintenance. Where such savings are not needed to reduce rents, they can be applied to reducing subsidy, thereby spreading a given amount over a larger program.

The 21,700 PWA dwelling units continue to furnish a valuable laboratory for problems of tenant selection and management. Thirty-one projects out of 48 have been leased for operation to their appropriate local authorities and several more are about to be. The latest figures give \$11.45 as the average monthly shelter rent (without utilities) per USHA-aided dwelling in the South

and \$15.80 in the North.

Actual family income figures in two Buffalo USHA projects are of interest because the PWA project in Buffalo had been sharply criticized as out of reach of low-income families. The first 67 Negro families at Willert Park had average incomes of \$896.72, and the first 80 white families at Lakeview averaged \$957.87. Minimum incomes ran roughly \$100 less. In the South incomes of tenants are much lower. New York city, in addition to its PWA and USHA projects, has a small one under way on the lower East Side financed by a special city tax. In an earlier planning stage is a large project near the Brooklyn navy yard to be financed entirely by the State.

The Farm Security Administration continues to operate its rural and suburban projects, but is building no more of them. It is, however, as well as other agencies of the Department of Agriculture, co-operating with USHA in its plans for rural work. (See also MUNICIPAL GOVERNMENT: *Housing*; UNITED STATES: *Housing*; WASHINGTON, D.C.)

Europe.—There were no special developments in housing in Great Britain in 1939 and, of course, many of the programs in Europe and the United Kingdom were interrupted by the outbreak of war. Such housing schemes as were in the course of building are being finished off, but it is very doubtful if there will be any further schemes embarked upon in Britain for some time yet.

In Britain the attention of many people interested in housing was turned earlier in 1939 to the investigation of the problem of holiday camps which were regarded by many as being as essential as housing. The Camps Corporation appointed by the State put up a program for the building in the first place of 50 camps which were to be of such a nature as could be used for country schools and holiday centres for children taken out from the densely populated city areas. The Building Centre organized a competition for a camp to fill a triple purpose on the above lines, and there was an exhibition prior to this held at the Housing Centre.

It is generally felt, in the bigger cities particularly, that where new housing is being provided and especially in large blocks of flats, that it should carry with it an annual evacuation of children for at least a month of the year to carry on their school work in country surroundings.

The whole problem of the school camp raised again the question, which for some time past has been very seriously considered, of prefabrication of building units. This question is now being very closely studied by many housing experts in view of the probable need of speeding up of housing immediately after the war, and also on account of the present shortage of some essential building materials. Although this is by no means a new idea very little has yet been done in housing by way of prefabrication. There is, of course, the well known Swedish method where most of the housing carried out by the municipality of Stockholm in cottage form is in timber.

Prefabrication in timber is perhaps the simplest method of all and particularly in Sweden where supplies are almost unlimited. There sections of houses are made in factories; doors, windows and other units in standardized sizes are produced and taken to the site and assembled by the tenant himself. A good deal of thought was given previous to the European war to this method, more particularly in Scotland where the system was to be introduced to meet a situation very largely aggravated by the local shortage of various materials and more especially of skilled building labour.

The other prefabricated system of any importance is that introduced in France by M. Mopin in the building of working-class flats. An extremely interesting scheme carried out on the Mopin lines was partially built during 1939 in Leeds where vast slum clearance problems had to be faced, and it was found to be very satisfactory. The final scheme is to house 5,000 families and is at Quarry Hill, and there, as in France where the system has been used, big workshops were set up on the site to prefabricate concrete units of various types which were used for the skin, floors, and walls of the steel-framed buildings.

Incidentally also in this scheme for the first time in England was introduced the "Garchy" system of refuse disposal, a system by which all the household rubbish is disposed of through a large trap in the kitchen sink whence it is carried away to incinerators on the site, and from the heat generated from the incinerators hot water is supplied. The Quarry Hill scheme generally is likely to have a good deal of influence on future housing in England, and is being studied by many as a possible system for the future.

There has been comparatively very little activity in housing on the Continent and nothing of a special nature. Spain, however, since the end of the Civil War, is making big efforts under very difficult circumstances to proceed with what is probably the first of its kind, a comprehensive program of housing and building for social services. (See also ARCHITECTURE; PUBLIC HEALTH ENGINEERING: *Housing*; TOWN AND CITY PLANNING.) (F. R. Y.)

Howard, Sidney Coe (1891-1939), U.S. dramatist, was born in Oakland, Calif., on June 26. After graduating from the University of California in 1915 he studied for a year in the playwriting class of Prof. George P. Baker's "47 Workshop" at Harvard. Then he joined an ambulance corps on the Western front and in the Balkans and, after the United States declared war on Germany, he was a captain of aviation in France. Upon his return to America he was on the editorial staff of the old magazine *Life*, of which he became literary editor in 1922. Later he wrote special articles for *The New Republic*. His first play, *Swords*, appeared in 1921; it was followed by a series of notably successful productions on Broadway which also gained for Howard the reputation of being one of the half-dozen or so of the United States' outstanding younger playwrights. *They Knew What They Wanted* (1925) won the Pulitzer play prize. Others were *The Silver Cord* (1926), *Yellow-jack* (1928), *Alien Corn* (1931), *The Late Christopher Bean* (1933), *Paths of Glory*, with Humphrey Cobb (1935), *The Ghost of Yankee Doodle* (1937), and *Madam, Will you Walk?* (1939), which was being cast for production at the time of his death. In March 1938 Howard and four other dramatists (Elmer Rice, Samuel N. Behrman, Maxwell Anderson, and Robert E. Sherwood) jointly established the Playwrights' Company to stage their own plays without benefit of other professional producers. Howard also prepared the scenarios for *Bull Dog Drummond*, *Dodsworth*, *Gone with the Wind* and other motion pictures, and translated a number of plays from the French, German, Spanish, and Hungarian. He was crushed to death by a tractor August 23 on his dairy farm near Tyringham, Massachusetts. See also *Encyclopædia Britannica*, vol. 11, p. 848.

Howard of Penrith, 1ST BARON (ESME WILLIAM HOWARD) (1863-1939), British diplomat, was born at Greystoke castle, Cumberland, on September 15 and was educated at Harrow. He entered the diplomatic service in 1885 as assistant private secretary to the earl of Carnarvon in Ireland, and the next year he was attached to the British embassy at Rome. In 1888 he was appointed third secretary of the embassy at Berlin, where he served for four years. He was a trooper

in South Africa during the Boer War and was decorated with a medal and four clasps. From 1903 to 1906 he was consul-general for Crete, from 1906 to 1908 councillor of the British embassy at Washington, from 1908 to 1911 consul-general for Hungary, and then minister to Switzerland (1911-13) and Sweden (1913-19) and ambassador to Spain (1919-24). From 1924 to 1930, as Sir Esme Howard, he was Britain's ambassador to the U.S.A., and was dean of the diplomatic corps in Washington. Upon his return to England in 1930 he was raised to the peerage. Lord Howard was the author of *Theatre of Life* (2 vols., 1935-36). He died at Hindhead, Surrey, on August 1.

Howland Island: see SOUTH SEA AND EQUATORIAL ISLANDS.

Hsu Shih-chang (1858-1939), Chinese statesman, was born in Tientsin of humble parentage and was educated at Peking. He entered Government service and rose rapidly until he became grand councillor in 1906. From 1907 to 1909 he was viceroy of Manchuria. Thereafter he occupied a series of important governmental posts, as associate prime minister in 1911, vice-president of the privy council, chief of the general staff, and Grand Guardian to the Emperor, the most exalted title of the Manchu dynasty. Hsu enjoyed the confidence of China's disunited military leaders, and it was their political support which led to his election as president of China on Sept. 4, 1918. For an account of his administration, which continued until his resignation in 1922, see *Encyclopædia Britannica*, vol. 5, p. 543 fol. He died at Tientsin on June 5.

Hungary. Area (July 15, 1939) 45,230 sq.mi.; (incl. Carpathian area); pop. (July 15, 1939) 10,817,286; (incl. Carpathian area). Chief towns (pop. Dec. 31, 1938): Budapest (1,067,523); Szeged (140,956); Debrecen (127,935); Kécskemét (83,573). Regent: Admiral Nicholas Horthy; premier: Count Paul Teleki; language: Hungarian; religion: Christian (1930: Catholic 64.9%; Protestant 27%; Greek Catholic 2.3%).

History.—Foreign Affairs.—On January 13 Hungary adhered to the anti-Comintern Pact, and on January 26 the foreign minister, Count Csáky, made a strongly pro-axis speech on Hungary's foreign relations; while on February 2 the U.S.S.R. severed diplomatic relations with Hungary. On April 11 Hungary resigned from the League of Nations. Meanwhile, her relations with Czecho-Slovakia had remained strained, frontier incidents being frequent (particularly one at Munkacs, January 6). On March 14, when Slovakia declared her "independence" of Prague, Hungary sent an ultimatum to Prague to evacuate Ruthenia and immediately afterwards occupied that area herself; on March 16 she declared it reincorporated in Hungary. On March 23 Hungarian troops moved westward and after some fighting occupied a further area west of the Ung. The total addition to Hungary was about 13,100 sq.km. and 720,000 inhabitants, of whom about 450,000 were Ruthenes and about 120,000 Magyars. Rumania had partially mobilized, and relations with that country remained very strained throughout the summer.

On August 25 Rumania offered a non-aggression pact, but Hungary, while disclaiming any intention of aggression, insisted on preliminary guarantees for the Magyar minority in Rumania, a condition repeated by Count Csáky on September 15. On October 7 the two countries withdrew their troops from the frontier, thanks to the mediation of Yugoslavia, with whom Hungary's relations had become very cordial; but it was clear that Hungary felt that Rumania must make substantial concessions, territorial or otherwise, if she was to enjoy Hungary's friendship. Count Csáky again indicated this in vigorous terms in a long speech on foreign affairs on Nov. 21.

Meanwhile, Hungary had remained neutral on the outbreak of war, showing thereafter a tendency to lean very strongly on Italy and, in a less degree, on Yugoslavia, while towards Germany her attitude had become rather defensive; towards the U.S.S.R. even more so, although diplomatic relations were resumed in October. The Rumanian difficulty prevented Hungary from helping to form a more solid "neutral bloc": Csáky declared that Hungary could not join such a bloc if it were directed against any outside state.

Internal Affairs.—On February 14 the premier, Dr. Imredy, resigned, being succeeded by Count Teleki, Professor Homan resuming as minister of education. Elections at the end of May gave the Government party, now known as the "Party of Hungarian Life," 183 seats, while the 28 deputies for the recovered Northern districts usually supported them. The so-called "Nyilas keresztes" (Arrow-Cross) Party, a Hungarian brand of Nazis, got 31 seats, 4 dissident Nazi parties, 11 seats, while the Small-holders' Party was reduced to 14, the Liberals and Socialists to 5 each, and the Christian Party to 4. The Government encountered repeated difficulties with the Nyilas opposition, against which it often took strong measures. This movement seemed, however, to be on the decline, for at the end of the year its candidates were heavily defeated in two successive by-elections. The chief internal measures adopted were a second, more drastic anti-Jewish law, and a modest land reform act. Autonomy for Ruthenia was promised. The German minority was allowed to constitute itself as a "Volksbund." (See also RUTHENIA; LITTLE ENTENTE.) (N. J. S.)

Education.—In 1937-38: elementary schools 6,899; scholars 963,087; continuation schools 5,740; scholars 299,321; universities 5; number of students 9,746.

Defence.—The army consists of eight army corps, four motorized brigades and two cavalry brigades. Expenditure from July 31, 1939 to Dec. 31, 1940 is estimated at 498,581,000 pengős.

Banking and Finance.—Revenue (est. July 1, 1939-Dec. 31, 1940), 2,563,194,000 pengős; expenditure (same period) 2,693,156,000 pengős; public debt (June 30, 1939) 2,088,527,230 pengős; notes in circulation (Aug. 31, 1939) 1,038,333,730 pengős; gold and silver reserve (Aug. 3, 1939) 225,403,828 pengős; exchange rate (Aug. 31, 1939) 21½ pengős=£1 sterling.

Trade and Communication.—Foreign trade, (merchandise): imports (1938) 410,607,000 pengős; (Jan.-Aug. 1939) 327,250,000 pengős; exports (1938) 522,382,000 pengős; (Jan.-Aug. 1939) 391,010,000 pengős. Communications (Jan. 1, 1939): roads, public 22,166mi.; railways, open to traffic 5,381mi.; waterways, navigable 1,139mi.; motor vehicles licensed (Dec. 31, 1938) cars and taxis 18,896; trucks, buses, etc., 5,312; cycles 10,837; telephones, number of subscribers (Dec. 31, 1938) 119,827; wireless receiving set licences (Dec. 31, 1938) 419,233.

Agriculture, Manufactures, Mineral Production.—Production 1938 (in metric tons): wheat 2,688,315; (1939) 3,069,000; maize 2,662,041; (1939) 2,250,900; rye 804,626; (1939) 896,900; barley 723,977; (1939) 780,500; oats 310,360; (1939) 356,700; potatoes 2,140,623; beet sugar 969,402; wine 3,060,000 hectolitres; lignite 8,305,827; coal 1,042,051; bauxite (crude ore) 540,315; manganese ore (metal content) (1937) 10,100; petroleum, crude 43,000; iron ore (metal content) 105,000; pig iron and ferro-alloys 334,880; steel 647,508; tobacco 20,400; hemp (fibre) 13,700; linseed 8,900. There were 3,885,643 pigs, 2,379,532 cattle, 1,868,122 sheep. Industry and labour: industrial production index (1929=100) (average 1938) 125.3; (average Jan.-June, 1939) 137.5; number employed in industry (average 1938) 1,159,690; employment index (1929=100) (average 1938) 112.3; (June 30, 1939) 125.0; unemployment, applications for work (average 1938) 47.426; (June 30, 1939) 46.876. (W. H. Wn.)

Hurdling: see TRACK AND FIELD SPORTS.

Ice Hockey played to 5,000,000 spectators in the United States, during the 1938-39 season, with the professional teams basking in the limelight on the glossy ice of the big rinks. Hockey is now the most important feature of the winter program of Madison Square Garden, New York. The National Hockey League played its seven-team schedule to an average attendance of 10,000 persons a game.

The premier trophy of 1939 in the world of professional hockey—the Stanley Cup—went to the world's championship team, the Boston Bruins, in the National Hockey League (the major league) by defeating the New York Rangers. In the minor leagues: the Philadelphia Ramblers won in the eastern division, and the Hershey team in the western division of the International League; the St. Louis Flyers stand first in the American Hockey Association, and the Portland team led in the Pacific Coast Hockey League.

The Cleveland American Legion team defeated the Minnesota Gophers for the National A.A.U. ice hockey championship. Among leading amateur teams playing the eastern circuits, the New York Rovers led in the Eastern Amateur Hockey League and also defeated the strong Holzbaugh Fords of Detroit in a post-season series for the championship of the United States Amateur Hockey Association, a newly organized outlaw amateur group. The Jamaica Hawks were the victors in the Metropolitan Hockey League.

McGill university blanketed the field in the International Intercollegiate Ice Hockey League. Dartmouth, for the second year in a row, won the Quadrangular League title from Harvard, Princeton and Yale. The crown of the Private Schools Hockey League went to the fast team of St. Francis Prep school, of Brooklyn, and the championship title of the Public Schools Athletic League of New York city was won by the Brooklyn Technical High school.

Abroad.—One of the few recorded hockey championship contests on foreign soil took Europeans by surprise when a team of Canadian skaters, known as the Trail (B.C.) Smoke Eaters, won the world amateur championship crown by defeating a United States team, at Basle, Switzerland. In Canadian amateur hockey, honours were divided between the East and the West. The Port Arthur Bear Cats captured the Allen Cup, symbolic of the amateur championship of Canada in the senior tournament, while the Oshawa Generals won the Memorial Cup in the junior competition. (J. B. P.)

Iceland, area 39,709 sq.mi.; pop. (1938) 118,888; capital town: Reykjavik (pop. 1938, 37,366). Ruler: King Christian X of Denmark and Iceland; language: Icelandic; religion: Christian (Lutheran).

History.—The result of the sea fisheries in 1939 was under normal. As one of the countries which have the largest foreign trade per capita, Iceland has had great difficulty in recent years in marketing her products as a result of import restrictions. Consequently she has had to establish strict control over her own imports and the transfer of foreign exchange. In April 1939 the Icelandic króna was devalued by 22%, and the rate of the pound, which had been maintained at 22.15 kr. for over 10 years, was accordingly raised to 27.00 krónur. A law of Sept. 18, 1939, provides, however, that when the rate of the pound expressed in dollars falls below 4.15, the value of the króna shall be adjusted to the dollar instead of the pound.

Shortly after the devaluation of the currency, the Government formed by the Progressive Peasants party was succeeded by a National Government under the former premier, Hermann Jónasson, with the support of all parties except the Communists.

Work on new roads progressed, so that most of the coastal towns can now be reached by car from Reykjavik, and the construction

of a heating plant whereby all the houses in the capital are to be heated with water from hot springs nearby was inaugurated.

Education.—Compulsory, 1 university and a number of secondary schools.

Banking and Finance.—In 1938, revenue 10,308,000 krónur; expenditure 17,587,000 krónur; notes in circulation (Oct. 1939) 13,785,000 krónur; gold reserve (Oct. 1939) 2,799,000 krónur; currency (Dec. 15, 1939) 25.75 krónur=£1 sterling.

Trade and Communication.—Overseas trade, 1938: imports 49,102 krónur; exports 57,752 krónur. Communications: roads, main 4,800 kilometres.

Agriculture.—Export production in 1938: (in metric tons) klip-fish and uncured salted fish, 43,661; herring, cured (barrels) 326,753; whitefish 15,663; codliver oil and herring oil 28,976; herring meal and fish meal 22,234; mutton, frozen 2,433; wool 577; sheep-skins (export) (number) 453,224; total production: hay 209,410; potatoes 2,317; sheep (head) 591,948; cattle 36,696; horses 49,018; poultry 86,092.

Ice Skating. About 100 carnivals were staged in 1939, thereby developing what was once an exclusive amateur hobby into a big industry within a few years.

The national figure skating championships were held in St. Paul, Minn., for the first time. The national titles were won by the 1938 titleholders, Robin Lee, and Miss Joan Tozzer, both of Minneapolis. Miss Tozzer and Bernard Fox won the national pairs title, and the national dance crown was won by Miss Sandy MacDonald and Harold Hartshorn, of New York. Lee has since become a professional.

National speed honours went to skaters of the Mid-West. The new champion is Ken Bartholomew, of Minneapolis, who won over several veterans. The women's speed title went to Miss Madeline Horn, of Beaver Dam, Wis. The North American title events were held at Lake Placid, the men's title going to Charles Leighton, also of Minneapolis, and Miss Horn also captured the women's crown. A large field of skaters competed in the Middle Atlantic, the East's leading speed event, at Newburgh, N.Y., the home of speed skating in the U.S. Eddie Schroeder, of Chicago, the Olympic skater, took the title, and Miss Helen Bahil, of New York won the women's championship race.

Abroad.—Miss Megan Taylor, of England, won the world's speed skating championship for women, and the men's title went to Graham Sharp, also of England. Felix Kaspar, who was in Australia and did not defend his title, has since turned professional. Canadians dominated the North American championships, in Toronto. Miss Mary Rose Thacker, of Winnipeg, annexed the women's crown, and Monty Wilson, of Toronto, men's North American singles champion since 1929, again emerged the victor. (J. B. P.)

Idaho, is one of the far North-western States in the Union belonging to the group regionally designated as the Pacific North-west. The State's area is 83,880 sq.mi.; population, according to the U.S. census of 1930, 445,032; estimated Jan. 1, 1940, 500,000; capital Boise, 21,544, and the largest city. Cities of more than 5,000 are Pocatello, Idaho Falls, Lewiston, Twin Falls, Coeur d'Alene and Nampa. Idaho is a rural commonwealth. Of the State's population only 129,507, or 29.1%, are urban, according to the 1930 census. There are 437,562 whites, of whom 407,108 were native-born and 30,454 foreign-born. There were 3,638 Indians. In literacy the State was third (98.9%) in national rank, and fourth in the preponderance of native-born (91.5%).

History.—At the biennial election, Nov. 8, 1938, a Republican governor and legislature were elected. Since 1932, the State has had Democratic governors and since 1934 all governmental

branches have been Democratic. D. Worth Clark, a Democrat, was elected United States Senator; Henry Dworshak, a Republican, was elected Representative to Congress from the second district. Compton I. White, a Democrat, was re-elected Representative from the first district. State officials at the close of 1939 were: governor, C. A. Bottolfson; lieutenant-governor, Donald S. Whitehead; secretary of State, George H. Curtis; attorney-general J. W. Taylor; chief justice, James F. Ailshie; State treasurer, Myrtle Enking; State auditor, Calvin E. Wright; State mining inspector, Arthur Campbell.

The 25th legislature, which convened Jan. 2, 1939, and adjourned March 2, enacted 270 laws. Important statutes were those providing for the establishment of civil service tenure through civil service commissions for certain non-elective State employees; an automobile drivers' financial responsibility law; humanitarian occupational disease measures; reduction of passenger automobile licence costs to a flat \$5 fee, a step which reduces owners' operating costs, the loss of revenue to highway districts being compensated for by a diversion of revenues from the State Highway department; an appropriation of \$1,000,000 for the equalization of educational opportunity between "rich" and "poor" school districts, and a law permitting creation of locally-financed Junior College districts.

Education.—The school population during 1939 was 145,262. Of this number 122,952 attended public schools. There were 88,371 pupils and 3,129 teachers in 1,160 elementary schools. The high school enrolment was large; 34,581 pupils and 1,407 teachers in 186 schools.

Banking and Finance.—On June 30, 1939 there were 35 national and 48 State banks with a capital of \$5,102,200, deposits \$91,711,757.78, and total resources \$103,720,669.86. State Treasurer's receipts from Sept. 30, 1938 to Dec. 31, 1939 were \$35,347,149.74 and expenditures \$36,822,509.86, which with previous balances, left \$4,107,871.56 in the treasury. The State's assessed valuation was less than \$400,000,000. On April 1, 1939, the bonded debt was \$1,419,500, as compared with \$1,378,500 a year previously. The State entered 1940 in sound financial condition.

Agriculture, Manufactures, Mineral Production.—Most recent statistics (1935) reveal 45,113 farms valued at \$307,395,329, with an annual livestock and crop production income of \$120,000,000. The three leading crops in 1939 in dollar values were 22,624,000bu. of wheat, \$13,348,000; 2,196,000 tons of tame hay, \$14,494,000; and 29,670,000bu. of potatoes, \$11,275,000. Although Idaho's three major industries are agriculture, mining, and forestry, manufacturing is attaining increasing importance. Manufactured products reached, in 1935, a total of \$67,549,960. There were 459 manufacturing establishments, employing 10,537 wage workers, earning annually \$11,985,026. Eleven manufactures were producing outputs each in excess of \$1,000,000. The five largest in rank order were: lumber (\$19,326,216), smelting and mining lead (about \$10,000,000), butter (\$9,582,927), beet sugar (about \$5,000,000), and flour with grain mill products (\$4,288,941).

In 1939, Idaho's "big five" metals: silver, lead, zinc, copper, and gold, produced \$30,166,000 as compared to \$38,316,400 in 1937. In dollar values silver was first, with 17,199,600 oz. worth \$11,674,880 in 1939. Output and value of the others were: 181,400,000lb. of lead, valued at \$9,070,000; 93,150,000lb. of zinc, \$4,936,950; 114,000 oz. of gold, \$3,990,000; and 4,750,000lb. copper, \$494,000. Since the discovery of gold in 1860, Idaho mines have produced a huge metal output, valued at \$1,330,166,000. (Co. J. B.)

Illinois, a north central State of the United States, admitted to the Union in 1818, has a population of 7,630,654 (1930

census) of which 1,242,447 are foreign born, 328,972 Negro. Estimated population, July 1, 1937, 7,878,000. Area, 56,043 square miles. Capital, Springfield, population 71,864. Four cities in the State are larger: Chicago (3,376,438); Peoria (104,969); Rockford (85,864); E. St. Louis (74,347).

History.—State officers elected in 1936 were Henry Horner, governor; John Stelle, lieutenant-governor; Edward J. Hughes, secretary of State; Edward J. Barrett, auditor of public accounts; Otto J. Kerner, attorney general, all Democrats.

Ill health kept Governor Horner out of the State, Nov. 1938 to April 1939, and away from Springfield some time longer. Lieutenant-Governor Stelle, designated by the constitution as acting governor, associated with himself in the discharge of his duties two of the Governor's department heads and close friends, Charles H. Nudelman and James M. Slaterry. Senator James Hamilton Lewis died April 9. Mr. Slaterry, pending the Nov. 1940 election, was appointed to succeed him. Grace Abbott, internationally known in work for women, and Cardinal Mundelein, Archbishop of Chicago, died during the year.

With the Lower House of the General Assembly Republican, little constructive legislation was passed in the regular session. An act making women eligible for jury duty was passed. Bills limiting the power of the Parole Board and reapportioning the State to remove the discrimination against Chicago failed of passage. A bill increasing the State's contribution to old-age pensions was vetoed by the Governor. A special session to re-enact the State law was expected. Bills introduced by Senator Hickman repealing some 400 obsolete laws were passed. Biennial appropriations, reduced by the Governor's veto, totalled \$478,000,000 against an estimated revenue of \$456,000,000. State contribution for relief in the biennium was set at the compromise figure of \$96,000,000 which will have to be increased before the biennium's end.

Education.—Public instruction in Illinois is supervised by the State Superintendent of Public Instruction, elected for four years in the off-year election. For the year ending June 30, 1937, the enrolment (elementary and secondary schools) was 1,302,662, with a teaching staff of 47,819. School buildings numbered 13,934. Schools are supported by local taxation and a State distributive fund and are administered by some 12,000 school boards.

Of the State's higher institutions of learning, the University of Illinois had an enrolment in the fall of 1939 of 13,894, 1,220 of whom were in the Chicago departments. The five State normal schools reported a total enrolment of 7,852.

Public Welfare.—Twenty-seven State institutions with approximately 50,000 inmates are operated by the State Department of Public Welfare. Other duties include administration of services provided by the Social Security Act—old age assistance, child welfare, aid to handicapped children—for which new divisions have been formed. Co-operative measures providing aid for the blind and for dependent children have not yet been taken in Illinois.

Appropriations for the 1939-41 biennium total \$34,564,342 besides funds for continuing an extensive building program which the State has pursued in co-operation with the PWA. Illinois leads all States in the proportion of population receiving old-age pensions. In September 135,721 recipients received average monthly payments of \$19.61.

There were repeated escapes of inmates in the unwallled St. Charles School for Boys. The Public Welfare department hesitated long before using a legislative appropriation for a fence. An additional appropriation was made for an "Illinois Training School for Boys" intended for older and more hardened boys. An epidemic of typhoid at the Manteno State hospital resulted up to October 17 in 48 deaths and 386 patients. Indictments were voted against the Director of Public Welfare and three officers of the institution for alleged negligence.

Despite proposals to consolidate all public assistance activities in one department, the Illinois Emergency Relief Commission is now entering its ninth year. In July it required all clients on its rolls to re-apply. In September 1,043,645 persons in Illinois, 13.7% of the 1930 population, were dependent on the five public assistance programs, general relief, WPA, old-age assistance, mother's pensions and blind pensions. There were 125,190 persons employed in WPA projects as compared with 246,386 in Sept. 1938. Total expenditures for direct relief for the month were \$4,781,499.56 of which \$3,880,971.67 came from State funds.

Finance.—For the first 10 months of 1939 the State's revenue receipts were as follows: direct property tax (arrears, no tax levied since 1932), \$287,904.56; inheritances \$3,358,788.61; liquor taxes, \$9,273,471.34; insurance fees and taxes, \$7,091,137.14; corporation fees and taxes, \$3,320,190.49; interest on State funds, \$100,333.01; sales tax, \$71,220,596.45; public utility tax, \$7,799,084.15; motor fuel tax, \$34,829,191.86; motor vehicle tax, \$20,234,760.58; Illinois Central railroad, \$953,633.75; miscellaneous, \$7,499,464.71. Subventions from the Federal Government, and trust funds are not included. State bonded indebtedness included \$121,140,000 State highway bonds, \$16,956,000 soldiers' compensation bonds, \$1,000,000 waterway bonds, \$11,502,000 emergency relief bonds of 1932, \$26,500,000 emergency relief bonds of 1934.

Industry.—Reports from 6,752 manufacturing and non-manufacturing establishments employing 640,645 persons at a weekly payroll of \$17,701,302 in Oct. 1939 indicated a contraseasonal increase over Sept. 1939 of 3.6% in employment and of 7.3% in payrolls. Increases for Oct. 1939 over Oct. 1938 were respectively 10.8% and 17.7%; decreases for Oct. 1939 from Oct. 1937 were -8.0% and -6.1%. The 4,634 establishments reporting by sex in Oct. 1939 reported 356,795 males with a weekly payroll of \$11,005,989, and 100,207 females with a payroll of \$1,676,883.

Oil.—The oil industry continues its spectacular advance. By September daily production had reached a peak of 331,416 barrels. At present there are some 30 fields in 18 Illinois counties, with 3,000 wells in the fields discovered since Jan. 1, 1937. In the Salem-Lake Centralia pool, the richest of the fields, 1,200 wells have been drilled in little more than a year. The Fayette county, and the Central Basin in Clay, Richland, and Wayne counties are second and third. Illinois is now fourth among oil producing States, yielding about one-tenth the nation's production. In alleged protest against her uncontrolled production, and consequent price cutting, six States shut down their production in the late summer. Legislation regulating the industry by spacing wells and pro-rating product, as well as levying a tax on the new-found wealth of \$40,000 a day in royalties, has been earnestly advocated but so far remains unenacted.

Agriculture.—In the face of a crop decline in the United States of 3 to 4%, Illinois enjoyed a bounteous yield for the year. Estimated average corn yields of 51.5bu. per acre and soybean yields of 24bu. per acre set an all-time record. Previous high yields had been for corn 48bu. in 1937 and 23.5bu. for soybeans in 1938. Use of new hybrid strains of corn is partially responsible for the increase. The State's corn crop from 8,093,000ac. is expected to be 416,790,000 bushels. The fruit crop is well above the 10-year record, the apple crop being estimated at 4,700,000bu., much of it, however, of low quality. (T. C. PE.)

Illinois, University of, in the academic year 1938-39 reached a new all-time mark in enrolment, and began extensive new building construction on the campus. In the completed 1938-39 academic year, including extension courses and the 1938 summer session, the total of individuals enrolled was 17,500. The 1939 summer session set a new record with 3,894 students.

In November, 13,894 students enrolled for the first semester of 1939-40. Of these, 12,290 were on the campus at Urbana-Champaign, 1,220 on the campus at Chicago, and 384 in extra-mural courses. Of the enrolment, 1,458 were graduate students, these numbering 1,285 in the Graduate school at Urbana-Champaign and 173 in graduate work of the colleges of medicine and dentistry at Chicago.

In 1939 a total of 3,516 degrees were conferred. This included 2,562 bachelors, 635 masters, 112 doctors of philosophy, 159 doctors of medicine, 40 doctors of dental surgery, and 8 professional engineering degrees. For 1939-40, the total staff at Urbana and at Chicago numbered 2,687. Of this total, 56 persons were listed as solely administrators, 1,718 teaching staff, 178 research workers, 96 as librarians, 61 extension staff, 508 miscellaneous.

The operating budget for 1939-40 is \$8,532,397. This included \$5,432,500 from tax revenues through the biennial State appropriation plus income from other sources. About 13% of the operating budget funds will be expended for organized research.

The library is fifth in size among all American universities and largest of any State university. It contains 1,117,000 volumes, 339,000 pamphlets, 3,900 maps, and 10,600 pieces of sheet music. More than 30,000 volumes are added each year, by gift and purchase. Total value of the university's physical plant at June 30, 1939, was \$31,891,981. This includes 2,318 ac. of land—414 ac. comprising the main campus at Urbana-Champaign, 3 ac. the campus at Chicago, and balance in agricultural experiment farms; 77 major and 58 other buildings; improvements; equipment; and library.

As 1939 ended, new buildings under construction and being planned on the Urbana-Champaign campus totalled \$5,595,000 in value.

Illiteracy. During 1939, because of wars and upheavals over wide areas of the globe, there was a net loss in the world's efforts to reduce illiteracy and in similar movements toward popular education. Germany, which before the World War (1914-18) had established a high record in all forms of education, has lost ground during recent years because of concentration on military enterprises which culminated in 1939 in the European war. Czechoslovakia, with one of the highest literacy rates in the world, suffered great injuries to her school system because of the debacle of 1938 and the German conquest of 1939. China, with the greatest number of illiterates of any nation in the world, has been compelled because of the Japanese invasion to abandon her recent effective efforts to teach the masses to read through a simplified "alphabet" of 1,000 characters. Reports from the Union of Soviet Socialist Republics, where recent mass education had reduced illiteracy from the 75% of 1895 to less than 30% in 1937, indicate a slowing down in educational programs. Italy, Spain and all the countries of eastern and southern Europe have been too busy with wars and the threats of war to make any concerted national efforts toward popular education and national literacy. India and Egypt still report illiteracy of over 80% of the population. Mexico and other Latin American nations are making heroic efforts to improve the education of their people but illiteracy in all these countries is still exceedingly high. In Mexico nearly 60% of the population over ten years of age is still unable to read or write.

The United States of America was one of the few countries to continue to make progress in the reduction of illiteracy during the year 1939. A nation-wide effort to teach the whole nation to read and write continued to be the chief item in the vigorous program in adult education of the Works Progress Administration. In 1930—the last year for which comprehensive figures are available—the United States possessed 4,283,753 illiterates over ten

years of age, or 4.3% of the population of that age. The best record (only .6% illiterates) was shown by whites of foreign or mixed parentage, native whites having 1.8% illiterates, foreign born whites having 9.9% and Negroes 16.3%. Rates in given States, according to the 1930 census, ranged from Iowa with only 0.8% of its population illiterate to South Carolina with 14.9%. While Negroes still show the highest illiteracy of any large group of the American population, they have made the greatest recent progress. At the time of emancipation in 1863 it was estimated that of the 4,500,000 slaves and "free persons of colour" in the United States less than 5% could read and write; in 1939 the 12,000,000 American Negroes have a literacy rate above 85%. The Works Progress Administration reports that during the past six years of intensive effort it has taught 1,300,000 people to read and write. This should bring the illiteracy in the U.S. by the next decennial census to about 3% of the population over ten years of age, by far the best record the nation has shown at any time in its history. (E. R. E.)

Immigration. The principal laws in the United States relating to immigration are the act of Feb. 5, 1917, generally referred to as the basic immigration law, and the act of May 26, 1924, known as the quota act. The act of 1917 provides for the exclusion and deportation from the United States of aliens because of their mental, physical, economic or social unsuitability. The act of 1924 places a limitation on the number of aliens who may enter the United States annually for permanent residence.

Numerical restrictions are not placed upon natives of Canada, Newfoundland, the Canal Zone, or independent countries of the Western Hemisphere; and such restrictions do not apply to the wives and unmarried minor children of citizens, or to the husbands of citizens where marriage occurred prior to July 1, 1932. The administration of all laws relating to immigration is under the supervision of the Commissioner of Immigration and Naturalization at Washington, D.C.

In the fiscal year ended June 30, 1939, 82,998 immigrant and 185,333 non-immigrant aliens were admitted, while 26,651 emigrant and 174,758 non-emigrant aliens departed from the United States. Of the "immigrant" class, 63,138 were from European countries, 17,139 were from the Americas, and 2,721 were from Asiatic and other sources. Included in this class were 1,088 husbands, 3,759 wives, and 2,196 minor children of American citizens. Under the "non-immigrant" classification 42,267 aliens were admitted as returning residents.

During the same period 6,498 aliens were debarred from admission at ports of entry, and 8,202 aliens, including 1,638 criminals, were deported from the country. As distinguished from deportation, 1,825 indigent aliens were repatriated at their own request, and 392 Filipinos were returned to the Philippine islands.

Immigration officers boarded 33,836 vessels and inspected crews totalling 971,662 alien and 416,124 American citizen seamen. Because of discharges, hospitalization, or desertion 19,918 alien seamen did not leave with the vessels on which they arrived. However, 17,252 alien seamen shipped out of American ports during the year, leaving an excess of arrivals over departures of only 2,666. (See also REFUGEES.) (J. L. Ho.)

Income Tax. Changes made in the Federal income tax law in 1939 were designed in large part to remove tax

deterrents to business initiative. They concerned primarily the taxes payable by corporations, although some significant changes were made also in the tax on the incomes of individuals.

Federal income tax collections in the fiscal year ended June 30, 1939, amounted to \$2,151,375,000 or 39.1% of the total Federal internal revenue and customs. The individual and corporate income taxes contributed \$1,028,834,000 and \$1,122,541,000, respectively, to this total. Excess-profits tax collections, not included in the above totals, amounted to \$27,056,000.

State income tax collections in 1938 are estimated to have been \$437,000,000 (\$249,000,000 from individuals and \$188,000,000 from corporations) or 11.3% of estimated State tax revenues.

Tax on Individuals.—The Federal Government's individual income tax consists of a 4% normal tax and a surtax ranging from 4% to 75%, applicable to incomes over \$4,000 after allowance for exemptions and credits. The personal exemptions allowed for both normal and surtax purposes are at present \$1,000 for a single person, \$2,500 for married persons and \$400 for dependents. The earned income credit, applicable against the normal tax, is at a rate of 10%, allowable only on amounts of earned income not in excess of \$14,000, with \$3,000 of income considered earned whether or not actually earned. These provisions serve to exempt from Federal income taxes single individuals with net incomes of \$1,111 or less and married persons with net incomes of \$2,778 or less, if without dependents.

Federal income tax data for 1937, compiled from income tax returns filed in 1938, show that in that year 3,371,443 individuals were liable for Federal income taxes. This exceeded the corresponding number for the preceding year by 510,335 or 17.8%. These data reveal further that 58.5% of the total net income reported by individuals was received by persons having less than \$5,000 and 92.1% by persons having less than \$50,000 net income each. On the other hand, due to the operation of the exemptions and the progressive surtax rates, persons with less than \$5,000 net income paid 6.3% and those with less than \$50,000 net income paid 44.8% of the total individual income tax collections.

Individual income is taxed also by 31 States and the District of Columbia. In all but three of these the rates are progressive, the minimum rates ranging from 1% to 3%, and the maximum rates from 3% to 15%. Four additional States tax particular sources of income at flat rates. Six States in the above two groups impose also surtaxes.

In no instance, however, does the maximum State income tax

rate, including both normal and surtax, exceed 15%. In some instances, State income taxation is directed toward the low income groups, as is evidenced by the fact that the personal exemptions are below the Federal level in 12 States for single persons, in 21 States for married persons, and in 23 States for dependents. Although some States preceded the Federal Government in employing the income tax, more than half the States now imposing it adopted it in 1929 or thereafter.

Two important changes affecting the individual income tax were made during 1939. The first of these was effected by the Public Salary Tax Act of 1939, which subjects to the Federal income tax for taxable years beginning after Dec. 31, 1938, the compensation of all State and local officers and employees, as well as the compensation of judges of courts of the United States who took office on or before June 6, 1932, and consents to the non-discriminatory taxation of the compensation of Federal officers and employees received after Dec. 31, 1938 by State and local Governments. In general, prior to the enactment of this legislation the Federal income tax applied to the compensation of Federal employees but did not apply to the compensation of State and local employees. States with income taxes, on the other hand, usually taxed the salaries of State and local employees but did not tax the compensation of Federal employees.

In pursuance of the Public Salary Tax Act, 16 States and the District of Columbia passed legislation in 1939 providing for the taxation of the compensation of Federal employees. A number of additional States can tax the salaries of Federal employees without special legislation.

Another income tax change during 1939 was the provision in the Revenue Act of 1939 for a net operating business loss carry-over for a period of two years applicable to individuals, members of a partnership, estates and trusts, and participants in a common trust fund, as well as to corporations. This provision takes effect with respect to taxable years beginning after Dec. 31, 1939 but a net operating loss may be carried over from a year beginning on or after Jan. 1, 1939.

Corporation Income Tax.—The Revenue Act of 1939 imposes a flat rate of 18% upon corporations with net incomes of more than \$25,000. This change, applicable to taxable years beginning after Dec. 31, 1939, in effect removes the last remnant of the undistributed profits tax, which, under the 1938 Act, had been retained for corporations with net incomes of more than \$25,000 but reduced to a maximum of 2½%. Corporations with net incomes of \$25,000 or less are subject to rates graduated from 12½% of their net income not in excess of \$5,000 to 16% of such income in excess of \$20,000. In the case of corporations with net incomes of slightly over \$25,000, the law provides for an alternative tax which is designed to accomplish a gradual transition between the tax on corporations with net incomes of \$25,000 and less and the tax on those with net incomes in excess of that amount. With reference to the above size classification, it should be noted that whereas under the 1938 Act it was based upon net income, under the 1939 Act it is based upon net income less credits for (1) interest on certain obligations of the United States and Government corporations and (2) dividends received.

Banks, insurance companies, China Trade Act corporations and domestic corporations deriving a large portion of their gross income from sources within the United States, which were subject to a flat rate of 16½% under the 1938 Act, are taxed under the 1939 Act at the same rates as other corporations, that is, distinction is made between those with net incomes of \$25,000 or less and those with net incomes of more than \$25,000. The rate applicable to resident foreign corporations is decreased by the 1939 Act from 19% to 18% and the rate on mutual investment companies is increased from 16½% to 18%.

NUMBER OF INDIVIDUAL NET INCOMES of \$1,000,000 or more in the United States in calendar years indicated

"A VERY DELICATE CHILD" was the Administration's economy plan of 1939, according to Thomas of *The Detroit News*

Federal income tax statistics show that 529,097 corporations filed income tax returns for 1937, of which 192,028 reported net incomes and 285,810 reported deficits. The remaining 51,259 corporations were inactive during the year. The aggregate net income of the corporations reporting net incomes was \$9,634,837,000; the total deficit of the corporations with no net income was \$2,280,846,000.

The classification of corporations by the size of their net incomes is not yet available for 1937. In the preceding year, 1936, only 13.7% of the total net income corporations reported net incomes in excess of \$25,000. The corporations in this group, however, accounted for approximately 93% of the total net income and paid approximately 93% of the total tax.

General corporation income taxes are also levied by 32 States and the District of Columbia. One additional State restricts its corporate tax to income from intangibles. Six States impose graduated rates, the minimum rates ranging from 1% to 3% and the maximum rates from 5% to 8%. The other 27 States and the District of Columbia impose flat rates, ranging from 1½% to 8%. Rates of 2%, 4% or 6% are most frequent.

The Revenue Act of 1939 made significant changes in the Federal corporation income tax with respect to (1) the carry-over of net operating business losses, (2) the treatment of corporate capital losses, and (3) the treatment of income resulting from the discharge of corporate indebtedness.

The provision regarding the carry-over of net operating business losses for individual income tax purposes, discussed above, applies also to corporations. However, the privilege of carrying over losses is denied to personal holding companies, mutual investment companies and (for purposes of the surtax) to corporations subject to the surtax on improper accumulation of surpluses.

Under the Revenue Acts of 1934-38, corporations were allowed to deduct capital losses only to the extent of \$2,000 plus capital gains. The Revenue Act of 1939 allows to corporations, other than domestic and foreign personal holding companies, full deduction of losses on capital assets held for more than 18 months against ordinary net income for the taxable year in which the loss was realized. Losses of corporations on capital assets held 18 months or less, so-called short-term capital losses, are allowed only to the extent of short-term gains, but losses disallowed in one year (to an amount not exceeding net income) may be carried forward and applied against gains from such transactions in the succeeding taxable year. This corresponds to the treatment

of the short-term capital losses of individuals provided by the Revenue Act of 1938. Short and long-term gains are treated the same as other income.

The Revenue Act of 1939 liberalized the treatment of income resulting from the purchase of bonds at less than their face value in the case of debt-ridden corporations. A corporation which establishes to the satisfaction of the Commissioner that it is in unsound financial condition may redeem its bonds, notes, or other evidences of indebtedness in existence on June 1, 1939 at less than face value without recognition of gain if such redemption occurs after the enactment of the 1939 Act, June 29, 1939, and in a taxable year beginning prior to Jan. 1, 1943.

Finally, mention should be made of the provision of the Revenue Act of 1939 authorizing corporations to increase their capital stock valuations for the fiscal years ending June 30, 1939 and June 30, 1940. The Revenue Act of 1938 had previously authorized the revaluation of capital stock in 1938 and every third year thereafter. This provision affects also the excess-profits tax since the valuation adopted for capital stock tax purposes determines also the liability under the excess-profits tax. (See also LEGISLATION, FEDERAL: *The Revenue Act of 1939.*) (R. BL.)

United Kingdom.—Owing to the war the income tax position in the United Kingdom for the year 1939-40 was affected by the introduction of a second budget. Under the Finance Act, 1939, the income tax rate was maintained at 5s.6d. in the £. The rates of surtax, however, on income exceeding £2,000, as fixed by the Finance Act 1931—ranging from 1s. in the £1 to 7s.6d. in the £ on the excess, and subsequently increased by 10%—were now raised by 15% on the first £6,000 of the excess, and by 20% on the balance. The provisions against the evasion of surtax were further strengthened.

The Finance (No. 2.) Act, 1939 raised the income tax rate for the last three-quarters of the year 1939-40 to 7s.6d. in the £, making an average rate of 7s. in the £ for the full year. The surtax on incomes over £2,000 was raised to rates ranging from 1s.3d. in the £ to 9s.6d. in the £ on any excess over £30,000. In addition, provision was made for the reduction of certain allowances for the year 1940-41, such as the personal and child allowances and the earned income, reduced rate and age reliefs.

(H. E. A. C.)

India, area 1,575,187 sq.mi. of which the native states and agencies total 712,508 sq.mi.; pop. (est. 1938) 362,828,000. Chief towns (pop. census 1931): Calcutta (1,485,582); Bombay (1,161,382); Madras (647,230); Hyderabad (466,894); Delhi (cap. 447,442); Lahore (429,747). Ruler, George VI, Emperor; viceroy, the marquess of Linlithgow; languages, Hindi, Bengali and Urdu the most important; religions, Hinduism (approx. two-thirds), Mohammedan (approx. one-fifth).

History.—Cross-currents, not wholly dissociated from personal rivalries, kept the Congress party busy during the early part of 1939. In January the retiring president, S. C. Bose, came forward for re-election; but a nominee of Mahatma Gandhi was put up to oppose him. Mr. Bose won; whereupon Gandhi, while ostensibly accepting the verdict, turned at once to another field of activity. A trivial dispute with the chief of Rajkot was developed until Gandhi decided to "fast until death" over a question, as it has been described, of "whether the ruler of a state of less importance than the Isle of Wight has interpreted correctly the wording of an ambiguous letter relating to the composition of a committee." By the time that the viceroy had intervened and the chief justice of the federal court had given a lengthy opinion on the issue, Gandhi had the eyes of the world upon him, and consented to break his fast. Returning to the Congress, his renewed prestige enabled him to enforce Mr. Bose's retirement and replacement as president by

one of his own disciples, Dr. Rajendra Prasad of Bihar. Mr. Bose, whose following is mostly in Bengal, remains in the Congress as head of an extreme Left group, loosely allied with the communist affinities of Pandit J. L. Nehru; and the official temper of the Congress changes from ultimatum to bargaining.

The ultimatum had issued in February, when the Congress intimated to the Government that, within six months, a categorical answer must be given to its demand for self-determination; otherwise the demand would be made effective by the help of a national volunteer corps a million strong. The threat was ignored; in September the position had changed, and the weapon of bargaining was brought into operation. In the interval the Congress was hard at work attacking the preparations for federation. This, which is to be the culminating feature of the new constitution, has been awaiting the consent of the princes, whose adhesion to the federal scheme must be purely voluntary; but the Congress has always opposed it, and is consequently extending its activities from the British provinces into the states. Its method is a war of nerves upon the princes. An association is set up or emissaries engaged in a state, grievances against its ruler are sought out and magnified, and an agitation started for reform and representative institutions. In some of the larger states, drastic action has been taken against this interference; the Nizam of Hyderabad issued a firman in February, calling on his subjects to prevent harmonious development from being hampered by "poisonous influences from outside." Smaller states like Rajkot have been unable to resist the pressure, and at the same time cannot afford the changes which are demanded. Bitterly though it is resented in the states, the intervention of the Congress has put a decided brake on the movement toward federation.

Federation.—The argument of the Congress in fighting the federal scheme is that the representatives of the states in the Federal Government and legislature, being nominees of their rulers, will bring an autocratic and reactionary force into the central administration, and play into the hands of British imperialism. Gandhi leaves the point in no ambiguity; there can, he says, be "no halfway house between total extinction of the states, and the princes making their people responsible for the administration of their states." With this choice before them, it is not surprising that the more conservative rulers should hesitate to submit to a partnership in which, on the side of British India, the Congress influence would be dominant. The more progressive princes are equally reluctant, though on different grounds; why, they ask themselves, should they risk their treaty rights, if the paramount power in India is going to abdicate in favour of the revolutionary followers of Gandhi? This somewhat tenuous apprehension is a symptom of the cooling of the earlier enthusiasm which the princes displayed for the Federal idea at the Round Table conferences. When the hard administrative details come to be faced, the rulers find themselves required to surrender ancient powers and privileges inherent in their order. They have thus been hanging back from consent to the Instruments of Accession which have to be executed as the condition of admission into the federal structure.

After infinite suasion and negotiation, final drafts of those instruments were communicated to the princes in Jan. 1939, for acceptance or otherwise by September 1. At a conference of princes held at Bombay in June, the proposals were rejected as "fundamentally unsatisfactory" by states representing 71% of the total state population. This decision does not exhaust the obstacles to the project; the very stars in their courses seem to be fighting against it, despite the strenuous endeavours of Lord Linlithgow to get it completed during his viceroyalty. Not the least serious opposition comes from the Indian Muslims, who deprecate the principle of federation on the ground that it will

increase the Hindu power in the Central Government. The more fiery spirits in the Muslim camp indeed are aflame with a vision of exchanges of population which will enable a great Islamic state to be established in and around the Punjab, a state which will link up with the string of Islamic powers from Kabul to Istanbul. The prospects of an early federation are thus obscure; and yet all parties are agreed that there can be no national future for India until the provinces and the states are knit together in political unity.

India and the War.—Immediately on the entry of Great Britain into war (September 3), the viceroy broadcasted an appeal to all parties and sections in India for co-operation. The first response to come from a political organization was on September 10 from the National Liberal Federation, with a declaration that "India should unhesitatingly and ungrudgingly support the democratic powers." On September 15 the working committee of the Congress issued a lengthy statement, condemning Naziism but declaring that India cannot associate herself with an imperialistic war. Before taking a decision, however, the committee invited the British Government to announce its war aims in regard to India, which must include the establishment of a full democracy in the country and the right of the Indian people to frame their own constitution through a constituent assembly. On this understanding, the statement continued, India would join "other free nations for mutual defence against aggression and for economic co-operation." The all-India Congress committee met later, endorsed this reply and demanded, without further circumlocution, that "India must be declared an independent nation." On September 18 the Muslim League, with a watchful eye on the tactics of the Congress, urged that no declaration of constitutional advance should be made by the British Government without their consent and approval.

On October 22 the working committee of the Congress met and resolved that Lord Linlithgow's statement was unfortunate and wholly unsatisfactory, and that they were "unable to give any support to Great Britain." As gage of battle, they called upon ministers in the provinces who are adherents of the Congress party to resign, an order which was obeyed, so that eight out of the eleven provinces are now without cabinet Governments, further efforts by the viceroy to ease the tension having failed. The provinces are carrying on comfortably under the personal rule of their governors; but the general situation is that the Congress refuses co-operation in what it admits to be a righteous war and has attempted to make the administration unworkable because Great Britain is not prepared with an immediate declaration of India's independence. In this attitude Congress is not supported by the Muslim League or by a number of not unimportant, though smaller, Hindu political groups; even in orthodox Congress circles the feeling is growing that their case has been overstated, and a prominent organ of their press has recently been repudiating the idea of cutting the British connection. More important still, these declamations have not affected the general public; for the response to India's war effort is already widespread and impressive. Most of the greater princes have placed all their resources at the service of the Government; the martial races are pouring into the recruiting offices; and large quantities of material are on their way to England—tents, boots, sandbags, etc.: of sandbags 500,000,000 had been supplied by the end of November with a promise of another 100,000,000 a month to the end of April, 1940.

Education.—Recognized institutions in British India (excluding Burma): primary (males): schools 160,545, scholars 7,755,656; (females): schools 31,699, scholars 2,468,632; secondary (males): schools 11,731, scholars 2,005,031; (females): schools 1,325, scholars 282,841. Colleges (males): number 306, scholars 110,022; (females): number 40, scholars 6,593. Universities: British India

15, Native States 3.

Defence.—A committee under Lord Chatfield which has been examining the whole question of India's defence, has recommended the complete modernization of its military forces, at a cost of £33,000,000. It is understood that this has been accepted by the British Government, which will make India a gift of three-fourths of that sum.

Banking and Finance.—Although the budget estimates for 1938-39 had been balanced without extra taxation, the actual results reflected the trade depression, and searching economies had to be effected to avoid a deficit. The budget of 1939-40 was balanced without any special severity, other than doubling the import duty on raw cotton, a measure which the finance minister hoped would stimulate India's endeavours to grow a long-staple cotton of its own. A stringent income-tax law was passed during 1939, and ought to improve the future yield from that source. But the orthodox finance of the central Government is in strange contrast with the devices of the provincial ministers for filling their yawning exchequers. Their first demand in every case is for larger grants from the central Government, to be recouped by the reduction of the British garrison. Failing in that quest, some of them favour taxation on callings and professions, with special attention to the salaries of the public servants; and Bombay has an ambitious tax on immovable property, likely to check the recent building activity.

Revenue, central Government (est. 1938-39) Rs. 1,22,28,00,000; expenditure, central Government (est. 1938-39) Rs. 1,22,18,00,000; revenue, central Government (est. 1939-40) Rs. 1,21,82,00,000; expenditure, central Government (est. 1939-40) Rs. 1,21,77,00,000; public debt (March 31, 1939): domestic Rs. 7,36,42,00,000; public debt (March 31, 1939): external Rs. 4,69,14,00,000; notes in circulation (Sept. 1, 1939) Rs. 1,82,13,17,000; gold and sterling reserve (Sept. 1, 1939) Rs. 1,03,91,57,000; currency: 1 rupee (Rs. 1) = 1s. 6d. at par; average exchange rate (1938) Rs. 1 = 17.94 pence.

Trade and Communication.—By Jan. 1, 1940, there were signs of slow recovery from the preceding trade depression, although one important product, sugar, had been hit by unfavourable seasons. The balance of payments was improving, and the rupee exchanges showed no disturbance. With the outbreak of war, a new and abnormal stimulus will have been given to India's chief exports. Taking normal conditions, however, one can see material for anxiety in the economic situation. The nationalist ambition is to convert India from a purveyor of raw products into a great self-sufficient industrial power, the chief instrument of change being a protective tariff. In a sense that instrument has proved effective, as the yield of the protective customs duties is rapidly declining. But its reaction on the general well-being of the people is questionable. Falling imports must weaken the world's demand for India's agricultural produce; and the interests of the peasant will in time clash gravely with those of the politically-minded manufacturer. Some alleviation is being experienced meanwhile in the changing character of India's imports. Many of the old staples show a sharp fall—cotton, textiles, iron and steel, railway equipment, chemicals, soap, rubber. With this, however, the country's requirements are growing in diversity, and the import is rising of machinery, transport vehicles, all sorts of electrical equipment, films, wireless apparatus (there are now more than 70,000 receiving licences as against 55,000 in 1938), as also of certain food-stuffs and drinks.

Overseas trade 1938-39: imports, merchandise Rs. 1,52,32,76,888; exports, merchandise Rs. 1,62,79,16,269; re-exports, merchandise Rs. 6,42,35,626; gold and silver coin and bullion, imports Rs. 2,77,77,737; exports Rs. 14,09,08,106; imports from Afghanistan Rs. 2,48,95,446; exports to Afghanistan Rs. 50,70,332.

DOMINION STATUS FOR INDIA was demanded as a British war objective by Mohandas K. Gandhi, who returned in 1939 to an active political life

Indian Imports and Exports

	Imports from Rs.	Exports to Rs.
U.K.	46,49,10,104	55,51,13,129
Burma	24,34,06,923	10,03,16,993
Japan	15,41,33,950	14,50,02,043
Germany	12,02,72,979	8,55,48,779
U.S.A.	9,77,82,601	13,87,91,101

Roads (1937) British India only, 69,000mi. metalled, 200,000mi. unsurfaced. Railways (1937-38): Mileage open to traffic, 41,076, of which 29,732mi. are Government owned. Shipping, tonnage entered (monthly average 1938), 761,000; tonnage entered (Aug. 1939) 853,000.

Shipping, tonnage cleared (monthly average 1938) 793,000; tonnage cleared (Aug. 1939) 811,000.

Motor vehicles licensed (March 31, 1938): British India 97,872 cars and taxis; 39,172 commercial vehicles; 9,385 motor cycles, including scooters and auto-wheels. Wireless receiving set licences (April 30, 1939) 73,698.

Telephones (March 31, 1938): 71,862 straight-line connections, 463 exchanges.

Agriculture, Manufactures and Mineral Production.—Production: (in metric tons) rice (1938-39) 23,962,100; wheat (1939 est.) 10,086,300; cane sugar, raw (1938-39) 4,156,800; maize (1937-38) 2,155,600; barley (1937-38) 2,123,100; jute (1938) 1,242,000; coal (1938) 28,806,000; iron ore (metal content) (1938) 1,850,000; pig iron and ferro-alloys (1938) 1,576,000; steel (1938) 982,000; petroleum, crude (1938) 317,000; cotton, ginned (1938-39) 929,200; ground-nuts (1938-39) 3,080,500; tobacco (1937-38) 519,300; tea (1937) 195,200; manganese ore (metal content) (1938) 450,000; linseed (1938-39) 464,300; gold (1938) 10,000kg.; bauxite (1937) 15,400; potash (export 1937) 4,000; chrome ore (chromic oxide content) (1937) 31,000; rape seed (1938-39) 932,000; sesamum (1938-39) 401,400. Industry:

cotton (1938-39) yarn spun 1,303,245,902lb.; woven goods 920,475,805lb.; number of mills 435; average number employed 569,000. Jute (1937): mills 105; average number employed 309,000; total number of factories (1937) 10,647; average daily number employed (1937) 1,957,000. See also EDUCATION: *British Empire*. (ME.; W. H. WN.)

Indiana. Indiana was admitted into the Union Dec. 11, 1816, the day of the year now observed as Indiana Day. Official figures for its area vary somewhat; the topographical survey now in progress may, for the first time, give accuracy. According to the State Handbook of Geology (1922) the land surface is 36,045 sq.mi.; rivers and small lakes cover 280 sq.mi. and the southeast corner of Lake Michigan 230 sq.mi., making a total of 36,555 square miles. The centre of population of the United States in the 1930 census was near Linton, in Greene county. The population of the State, according to that census, was 3,238,503 (1938 estimate, about 3,500,000), of whom 3,116,136 were white and 111,982 Negroes. A larger per cent (92%) of the population than in any other State, is native born. The largest foreign group was 28,152 German-born immigrants. About 12% of the population lives on farms. There are 92 counties and 1,016 governmental townships in the State.

History.—The 81st session of the General Assembly was confined to its constitutional term Jan. 5-March 6, 1939; the lower house was Republican, the upper, Democratic. The principal legislation passed and approved was revision of the liquor laws (abolishing ports-of-entry and their import fees), and provision for unemployment compensation.

Governor M. Clifford Townsend; Lieutenant Governor and President of Senate, Henry F. Schricker; Speaker of House of Representatives, James M. Knapp; United States Senators, Frederick Van Nuys and Sherman Minton; Chief Justice, Michael L. Fansler.

Education.—The enrolment in public schools from the kindergarten through high school for the school year 1938-39 was 678,858 of which 23,924 were coloured; an additional 54,888 were enrolled in parochial schools. Current expenditures for the same year on public schools, not including colleges and universities, were \$50,675,798. Of these, \$4,990,095 was for transportation. In addition, there was a capital outlay of \$8,812,970. The closing of small, one-room schoolhouses has been a marked feature for the last 20 years. Hence the transportation of children to consolidated schools has been an increasing item of expenditure. The total number of public schools in operation in the State in the school year 1938-39 was 3,194; at the beginning of the school year 1939-40 there were 3,027. After 1940 four years of college will be required for licences to teach in elementary as well as in high schools.

Indiana university at Bloomington, Purdue university (the land grant university) at Lafayette, the Indiana State Teachers college at Terre Haute, and Ball State Teachers college at Muncie, are State-supported higher institutions of learning.

Charities and Correction.—Public care of needy, dependent, and delinquent classes during 1939 included, in addition to Federal relief and work projects and voluntary benevolence, direct relief administered by township trustees (\$13,016,426 in the year ending Dec. 31, 1938, as compared with \$7,589,578 in 1937) monthly awards, \$17.25 per month, under supervision of the State department of public welfare, to about 65,080, the maintenance of some 35,000 dependent children, monthly grants (about \$20 on the average) to 2,500 needy blind persons (the cost of this was shared by county, State and Federal Governments), and care of inmates in State institutions.

Banking and Finance.—June 30, 1939 there were in the State

386 State and 126 national banks, a total of 512 (a decrease of nine, as compared with 1938) with a total capital of \$104,172,450 (also a decrease). Principal assets and liabilities were: general market bonds held \$71,752,686 (a decrease); loans and discount, \$283,063,200; State, county and municipal bonds, \$53,228,967; U.S. Government securities, \$269,508,423; total cash and balance with banks, \$310,873,312; savings deposits, \$264,245,681, demand deposits, \$559,912,273, all increases, except as indicated, as compared with 1938.

The total revenue receipts of the State of Indiana for the year ending June 30, 1939, were \$84,347,458, including: from gross income tax \$19,981,968 (\$22,339,541 in 1938), from gasoline tax \$23,071,966 (\$22,717,437 in 1938) and from property tax \$5,981,566. State funds distributed to local units amounted to \$36,804,485, the largest items being for schools and roads. Federal aid to all units in the State and distributions for unemployment compensation during the fiscal year 1938-39 amounted to \$46,800,485; total property tax, all units, \$99,473,099; total revenue receipts exclusive of State distributions, \$184,547,069; grand total revenue receipts, all units, \$228,458,704. Total gross disbursements by the State in the year ending June 30, 1939 were \$162,095,683, compared with \$128,686,116 in 1938, most of the increase being accounted for by three new items: payments of unemployment compensation benefits of \$18,704,969, Federal funds disbursed in the amount of \$9,405,955, and unemployment compensation collections by the State transferred to the Federal Government in the amount of \$4,488,334. Total Government payments (all units), were \$191,994,321.

Agriculture.—The latest available figures are given; those for 1938 and 1939 are preliminary. Acreage of crops reported in 1938, 10,276,000 (10,877,900 in 1937). Production of four principal crops in 1938: corn, 173,389,000bu., 40,000,000 less than in 1937; wheat, 30,240,000bu., 4,500,000 less than in 1937; oats, 34,060,000bu., 11,000,000 less than in 1937; soybeans, on 828,000ac. (16,000 more than in 1937), 8,464,000bu., about 2,600,000 more than in 1937. The total farm value of crops in 1937 was \$190,937,000, in 1938 it was \$146,522,000; income from crops in 1937, \$74,556,000; from livestock and livestock products \$228,974,000; from Government payments \$8,624,000, gross income \$312,154,000—in each instance less than in 1937. Estimated total of cattle on farms Jan. 1, 1939, 1,633,000, 1% greater than a year before; hogs, 3,405,000, 7% greater; sheep, 714,000, same as the year before. The yield of corn per acre (1938) averaged 41bu., slightly above the general average; the average yield of wheat per acre 16bu., slightly less than the previous average.

Industry and Transportation.—Manufacturing has far outstripped agriculture in the last two decades in the number of men employed and in the production of wealth. The total value of manufactured products in 1937 (the latest year for which figures are available) was \$2,497,548,000, of which \$1,018,980,000 was counted as value added by manufacturing. Indiana ranks first among the States in the manufacture of iron and steel from crude ore, of kitchen cabinets, and in the fabrication of cotton gloves. The largest glass fruit jar factory in the United States is at Muncie; the largest petroleum refinery, at Whiting, and the largest automobile tire inner-tube factory at Indianapolis. Food products and pharmaceutical products are also extensively manufactured.

Minerals.—Principal mineral resources are bituminous coal, lying chiefly in the southwestern quarter of the State (16,000,000 to 30,000,000 tons per year extracted by strip and shaft mining); limestone in Owen; Lawrence and Monroe counties, the greatest source of oolitic limestone for building in the United States; clay, used extensively in building and paving brick, and in pottery; sand and gravel used in building and even more extensively in road-making; petroleum, the production of which was increased

during 1939 through the opening of new fields in the southwestern part of the State. Portland cement also is manufactured on a large scale. (C. B. C.)

Indians, American. The Indian population of the United States is on the increase. From an estimated total of something in the neighbourhood of 850,000 at the time of the discovery of America it sank to less than 250,000 in the 1890s. Since then there has been a gradual but steady increase, and the records for 1939 indicate a present population of 351,878. Since 1930 there has been a steady and continuous decrease in the death rate which for 1939 reached 13 per 1,000, or only 2% greater than that of the white population. There has been a similar continuing increase in the birth rate which for 1939 equalled 22.7 per 1,000, which is considerably above the white rate. Surprising as it may seem, this period has also seen an increase in the total number of full blood Indians and in the rate of their increase. As most of the Indians of Arizona and New Mexico are full bloods and are living in areas apart from whites this condition is likely to continue.

The Indian Reorganization Act of June 18, 1934 extended by the Oklahoma Welfare Act of June 26, 1936 and the Alaska Act of May 1, 1936 has made possible fundamental changes in the relationship of the American Indian to the Federal Government. The new Federal statute offers the Indians of today the opportunity to revive or continue their tribal type of organization as a governmental unit under law. These tribal organizations may incorporate and borrow Federal funds for use by the tribe or for reloan to individual Indians. The law made organization optional and each tribe was required to accept or reject the Act by a secret ballot vote before June 18, 1936. Of the 266 recognized Indian tribes, bands, or pueblos within the continental United States, 189 availed themselves of the new law, and of these 120 are in various stages of organization. Seventy-seven groups rejected the Act.

Since 1936 loans amounting to \$4,068,411 have been authorized for 53 of the organized groups; tribes have loaned \$785,615 of their own money to individual Indians; and unorganized tribes have been furnished \$522,946 of Federal credit from other sources. The Reorganization Act terminated the allotment policy under which approximately 100,000,000 acres of Indian land had been lost during the 50 years preceding the Act and made possible the re-acquisition of land for Indians. In various ways since 1933, the remaining 52,651,000 acres of land under the jurisdiction of the Indian Office have been increased by 2,907,143 acres.

During 1938 and 1939 research workers of the Indian Medical Service announced discovery of a filterable virus as the cause of trachoma, an eye disease affecting about 20% of the Indian population. Several Indian Service hospitals have experienced remarkable success in the use of sulphanilamide as a specific for its relief and in many instances its cure. There has been a continuing decrease in the death rate from tuberculosis indicating that Indians are developing an immunity similar to that possessed by whites.

Soil conservation activities on Indian reservations are bearing fruit in a revival of vegetative cover; Indian timber is being developed on a sustained yield basis; increased areas of Indian farm and grazing land are being withdrawn from lease and Indians are being taught to make profitable use of it themselves; additional irrigation developments are permitting more efficient use of land unsuited to dry farming. Despite all of these activities, there remains an increasing body of Indian people without land resources.

Steps are being taken by the Indian Education Service to encourage the development or use of a written form of several native

languages, in order to facilitate Indian understanding of activities being undertaken upon their behalf. (W. W. B.)

Indo-China, French: see FRENCH COLONIAL EMPIRE.

Industrial Research. The principal results of progress in 1939 are seen in the field of synthetic organic chemistry, including hydrocarbon derivatives, fine chemicals, plastics, and textile fibres. Metallurgy, glass technology, and building science have been helped forward by numerous improvements.

United States.—Over \$190,000,000, probably as much as \$215,000,000, was expended by manufacturers in supporting industrial research. During the year the cornerstones of all the regional research laboratories of the Bureau of Agricultural Chemistry and Engineering, U.S. Department of Agriculture, were laid. Many improvements in chemical processing equipment and in chemical products were displayed at the 17th Exposition of Chemical Industries. Many industrial research laboratories were increased in facilities and personnel. The New York World's Fair and the Golden Gate International Exposition had exhibits of interesting recent research creations of American industrial laboratories. Largely under the leadership of the Air Hygiene Foundation of America, advances were made in coping with numerous health hazards in American industries.

The Bureau of Mines investigated many problems in mineral technology. Marked advances were made in phase equilibrium studies of portland cement clinker. Outstanding in the glass industry was the development of safety glass for use particularly in automobile windshields combining the rubbery strength of polyvinyl acetal plastic with plate glass to produce a safety glass of great strength under all temperature conditions, but also sufficiently yielding to reduce passenger injuries on impact with it. An important development in the field of structural glass has been accomplished by the design of a new glass block containing a sheet of "Fiberglas" sealed into the block. An ultra-low expansion glass has been developed which promises the possibility of manufacture by mass production method of glass cooking utensils having properties superior to previous glass dishes and at a reasonable cost. High intensity mercury lamps were further improved. The sealed beam automobile headlight, a new type of gas-insulated X-ray tube, and a process for removing glare from reflected light on glass by the application of thin chemical films to the surface of the latter, came from researches of 1939. About \$10,000,000 was spent by the steel industry for scientific research. It was found that quite small amounts of silver can cut down the salt water corrosion of stainless steels very considerably. The Kinkead process consists of alloying the surfaces of steel sheets and shapes with coatings of stainless steel or other metals. New alloys were developed for the automobile industry. Among the investigations carried out at the National Bureau of Standards was a broad research on the effects of continuous weathering on light-metal alloys used in aircraft. Progress came in the realm of power generation from the use of high pressure, high temperature turbines with hydrogen-cooled generators. Refinements occurred in the utilization of electric power in the industries.

Brilliant triumphs are seen among the achievements of applied organic chemists. Hydrogen fluoride was demonstrated to be a superior catalyst for many organic reactions. Several hundred derivatives of the nitroparaffins have been prepared in the laboratory. An advance was made in the production of mustard gas by speeding the reaction of ethylene oxide and hydrogen sulphide. The study of diketene and its reactions was continued. Parthenocarp, the technique of producing fruit from unpollinated flowers, was benefited by two new growth substances, naphthalene acetic

acid and naphthalene acetamide. More than one-third of the vanillin consumption of the United States is being made from calcium ligninsulphonate. A new synthetic musk was disclosed. Synthetic camphor made from turpentine has broken the monopoly of Japan. It is said that the sulphanilamide derivatives reported by chemists working to produce new and better remedies of this kind now total about 800. The synthetic organic insecticide field has such potentialities that it is being cultivated researchfully in a broad way. By the end of 1940 it is estimated that most of the present 125,000,000-gal. aviation market will be supplied by 100-octane aviation gasoline.

At the Forest Products Laboratory anti-shrink treatments for wood are being developed, laminated construction is being studied broadly, and containers are getting constant attention. Experimentation in the manufacture of newsprint from southern woods is being continued. Sulphite pulp made from Georgia pine is said to be satisfactory for the production of viscose rayon. "Teca" is the name of a family of cellulose acetate rayon staple fibres, characterized by an inherent stabilized crimp. To bring "Nylon," announced in 1938, into general commercial production as soon as possible, \$2,500,000 is being spent on plant extensions at Belle, W. Va., for making "Nylon" intermediates, and \$8,500,000 on the erection of a "Nylon" textile plant at Seaford. "Vinyon," also announced in 1938, is particularly well suited for use in industrial filters ("Vinyon" duck) and for raincoats, fish lines and nets, boat sails, and bathing suits. Addition of still another member to the rapidly increasing family of filaments derived from purely synthetic resins is forecast by a patent recently granted for the production of elastic fibres from polyisobutylene of high molecular weight.

"Etho-raon" is a new fibre, a substitute for silk in the manufacture of hosiery yarn. Chemists are actively studying the possibility of producing fibres and foils from soybean protein and from zein. The Cotton Research Foundation has been adding valuably to the chemistry of cottonseed. Progress in soybean technology has been so rapid in the past few years that it is difficult to keep abreast of the developments.

Expansion of the direct use of latex has continued, many 1940 cars being equipped with foamed latex seat cushions. "Cryo-Vac" involves food products in odourless, tasteless natural rubber bags prepared from specially compounded latex. Advances were made in oil-resisting rubber. The extension of antiseptic rubber goods came from more research. Chlorinated rubber received impetus. Forward strides were made in the technology of "Pliofilm" and "Pliolite." High wartime prices for natural rubber may combine with lower production costs for the elastomers ("synthetic rubbers") as volume grows to enlarge the field within which they can compete with rubber. A practically odourless "Neoprene" was marketed. A new rubber-like material is synthesized by the polymerization of isobutylene. Butane has been reported as a cheap source of butadiene.

Methods of producing acrylic ester resins from lactic acid obtained from whey have been reported by the U. S. Bureau of Dairy Industry. The year 1939 has seen important advances in the development of methods and equipment for fully automatic compression moulding. Rapid-setting cast phenolics have been made generally available. Owing to the light weight, colours, effects, and ease of cleaning obtainable with plastics, these materials are being used in ever-increasing quantities for decorating and furnishing airliner cabins. Plastic lighting reached prominence in 1939, through the use of urea resin reflectors on laminated sheets. There was described the commercial availability of several grades of polyvinyl alcohol in powder form, indicating present mill development of its use for paper coating and adhesive purposes. Polyvinyl acetal-type resins are expected to have increased appli-

NYLON STOCKINGS were first placed on sale in 1939

cation in the field of electric wire insulation. The year 1939 has seen extension of the use of polyvinyl chloride solutions for the impregnation of fabrics. A new process, as yet undeveloped commercially, has been described for the electrodeposition upon metal surfaces of synthetic resins dissolved in hydrophobic solvents, such as mineral oils. Further study of the vinyl resins as adhesives and for paper coatings has resulted in several industrial applications. The use of these resins in the manufacture of paper hoods for milk bottles has been put on a commercial basis.

Among the new "Vinylite" products are synthetic resins in the improvement of plywood properties. It has been a year of activity in the development of the use of laminated phenolic resins in aeroplane construction, both in the U. S. and elsewhere.

Canada.—A special type of paint for use in marking road centres contains ground glass which reflects motor car headlights at night, making the traffic lanes quite visible. The mechanism and kinetics of the sulphite process were investigated. Western Canada flaxseed was studied chemically. The chemistry of lignin was enriched by research of 1939 and interest has been shown in the development of lignin plastics.

Among the investigations in progress under grants from the National Research Council are the preparation of powdered apple, determination of the seasonal variation in water and gas content of species used in the pulp and paper industry of Eastern Canada, action of bacteria and enzymes on carbohydrates and polysaccharides, mineral deficiency of Quebec soils, and concrete deterioration.

Brazil.—Efforts are being made to learn the technical aspects of the use of wood and charcoal as motor fuels. The expansion of industrial applications of papoula, the hemp of San Francisco, was investigated. Babassu nuts and carnauba wax were studied from the standpoint of utilization in native manufactured goods.

Great Britain.—British scientists have been indexed and classified, but not regimented, for war purposes. The Road Research Laboratory of the Department of Scientific and Industrial Research investigated fillers for tar and other bituminous surfaces. Rubber in powdered form has been recommended for incorporating with asphalt to improve the properties of the latter for road building purposes. The Fuel Research Station continued studies on the hydrogenation of tars on a pilot-plant scale. The Building Research Station studied the solubility of cement: permeability and extraction of lime are the main causes. Advances were made in the knowledge of the control of inclusions in steel, the effect of temperature on the properties of steels, creep resistance, and alloying. The work of the Electrical Research Association, which has been carried out at a total cost of \$400,000, has resulted in annual economies of approximately \$5,000,000, and investigations completed by the Iron and Steel Research Council are expected to save nearly \$2,000,000 a year in the production of pig iron and over \$6,000,000 annually in the cost of coal used in the manufacture of steel. During the year 1939 the new laboratories of the British Non-Ferrous Metals Research Association were opened in London. Among the new products shown at the British Industries Fair of 1939 were two

phenolic resins, several water-soluble resins, nonphenolic maleic resins, and phthalic ester plasticizers. Perhaps the most important new application of moulding resins during the year 1939 has been the production of a coffin, using a special "Bakelite" powder. Luminous moulding powders have been introduced. Physical modification of viscose rayon by stretch-spinning techniques has resulted in the production of a high tenacity viscose rayon ("Tenasco"). The use of polyamide resins for making yarn has been developed. Rubber threads are being employed in divers ways.

Netherlands.—"Mealorub," a powder containing 96% of rubber, produced by the Proefstation, West Java, is easily mixable with other substances and enables direct moulding of rubber and rubber-resin compositions. The Dutch Quinine Syndicate is endeavouring to find new uses for quinine in industry.

Belgium.—"Ethanite" was described as a rubber-like material obtained from olefins contained in cracked gas. At Port-Jerome phenol was found to be especially adapted to the solvent refining of lubricating oils.

France.—Industrial hygiene is being encouraged. Sulphonated naphthenamides were learned to be good wetting agents for textiles. Nitropentaglycerin is looked upon as a potential substitute for nitroglycerin. "Cristaplem" is a process for moulding cellulose acetate in plaster of Paris. Eight woods of French tropical Africa were studied for paper-making. A French company has introduced truck tires wherein metallic cables are used instead of textile cords.

Italy.—The possibility of Italy remaining neutral in the European war intensified production and research already active in the chemical field. Dimethylacetol has been found to be a satisfactory anti-knock for ordinary use. "Catagas" is water gas produced by the reaction of steam on gas oil instead of on coal. "Nitrometrol" is a new high explosive made from glucose and methanol. Bamboo was investigated as a source of alpha-cellulose. Crease-proof fabrics are being made with the aid of melamine resins. "Lenasel" and "Autar" are two new resistant fibres. The preparation of a textile fibre from fish skin is under development.

Germany.—The German chemical industry is now subject to an elaborate system of official wartime control. Germany is relatively favourably situated as to its zinc supply. Germany's copper-smelting industry has made progress in recent years owing to the increase of productive capacity and modernization of plants. The production and consumption of magnesium and aluminium increased in 1939. In the field of concrete the use of prestressed reinforcement is said to minimize tensile stresses and thereby to reduce cracking. Safety services have been advanced through research in industrial hygiene. It is thought in general that the prospect of finding new war gases appreciably more toxic than those already known is small. Germany's motor and aviation fuel needs have been well investigated. Lubricating oils especially for aeroplanes are being produced by an electrical discharge process that is said to increase viscosity. Researches on cellulose have related to constitution, digestion processes, lignin, bleaching, refining, and especially derivatives. A new fibre for use in place of jute, "Zelljute," was exhibited at the Leipzig Fair. "Pe-Ce" is a textile thread of polyvinyl chloride. "Ultrapas," a thermosetting melamine resin derived from dicyandiamide, is claimed to be easier to work and to give more beautiful results than urea plastics. The employment of moulded plastics in the manufacture of automobiles is said to be expanding rapidly. An apparently new development in bearing material is reported in the form of "Lignofol," a highly compressed resin-impregnated wood, of which bearings more than two feet across have been made. Full-scale manufacture of "Buna" ("synthetic rubber") in Schopkau, the first big works of its kind to be erected under the four-year plan, was begun during 1939. The production of synthetic fatty acids from paraffin will be increased to 30,000-40,000 tons yearly (from 60,000 tons of paraffin) because of the scarcity of fats for the soap industry.

Sweden.—The application of scientific research has been an important factor in attaining the success of the Consumers' Co-operative Union. Water pollution from sulphate cellulose plants has been investigated, and the lye waste from sulphite factories is now yielding "Sulfo-Glue," a substitute for animal and vegetable adhesives.

Norway.—A new phosphate fertilizer, "Orofosfat," was developed. The vitamin D potency of a number of different fish and fish products has been determined by the Norwegian Canning Industry at Stavanger.

U.S.S.R.—Sulphuric acid technology was improved by Soviet research of 1939. An investigation has shown that air is demercurized by hydrogen sulphide. Precarbonation of the mixture was found to intensify the ammonia-soda process. Research was continued on the utilization of Uralian titaniferous magnetites. By covering the steel parts of aeroplanes with a cadmium coating effective results were obtained. The technologies of aluminium, lithopone, and tar hydrogenation seem especially well advanced.

South Africa.—A Government committee has recommended a survey of coal deposits to determine the supply available for the Fischer-Tropsch and hydrogenation processes of making oil and gasoline. The use of fertilizers in South Africa is being stimulated by experimental work conducted by colleges of agriculture and in the private demonstration plots of manufacturing companies. A general survey of fish products has been undertaken with the object of insuring their more efficient utilization. Acetylene is being used to ripen fruit.

India.—Research has been done on the separation of titanium dioxide from bauxite. At the research laboratory of the Department of Industries of the Government of Bombay one of the projects related to the production of insecticides from waste tobacco. The Government of Assam has been considering an experimental cinchona plantation.

Australia.—The pulping properties of eucalyptus using the sulphate process were reported, and the preparation of menthol and thymol from eucalyptus oil was begun in Western Australia. The Council for Scientific and Industrial Research described the losses of the constituents of flax straw during retting and its investigations of chilled beef, microbial contamination acquired in meat plants, and cooling and storage in packing houses.

Japan.—Research is being conducted on the production of potash from cement dust and on uses for magnesite, especially in ceramics. Much research has been carried out on steel manufacture. Alunite from Chosen and alum shale from Manchoukuo have been investigated as sources of

aluminium, now mostly produced from imported bauxite. Facilities for research on coal hydrogenation and related processes are under expansion at Hsinking. A process of manufacturing aircraft lubricants from whale, sardine, and herring oils is to be industrialized. The retting of vegetable fibre materials was investigated broadly. Formosan vegetable tannins have received research and synthetic tanning materials will soon be produced commercially. The coalescence of the small textile research laboratories into one large establishment to be aided by the Government is a project under discussion. Reports have come of quadrupled production of soybean wool. The use of alginic acid in the manufacture of staple fibre continues to get attention. The synthesis of chloroprene from vinylacetylene has been accomplished by several workers. (See also CELLULOSE PRODUCTS; CHEMISTRY; CHEMISTRY, APPLIED; CHEMISTRY AND ENGINEERING, AGRICULTURAL, U.S. BUREAU OF; CHEMURGY; PLASTICS INDUSTRY.)

(W. A. HA.)

Infantile Paralysis. The year 1940 is the 100th year since infantile paralysis—poliomyelitis—has been known as a distinct disease. The German orthopaedic surgeon, Jacob Heine, first described individual cases of the malady, not suspecting it was infectious. The Swedish physician Medin 50 years later described the disease in epidemic form. It was not until 30 years ago that the Austrian bacteriologist Karl Landsteiner was able to transmit the illness to laboratory animals—and then only to apes and monkeys.

Monkeys are expensive laboratory animals. The disease never even in its worst outbreaks attacks a large proportion of a population. These facts have made progress in acquiring knowledge very slow. In 1939 a discovery of capital importance gave promise of more rapid clearing up of this baffling and mysterious ailment. Charles Armstrong of the National Institute of Health has transmitted the disease to the Eastern cotton rat, *Sigmodon hispidus hispidus*. At last investigators will have an animal that is cheap, docile, and easily bred in captivity.

Though accumulation of knowledge in regard to infantile paralysis has been discouragingly slow, yet a few facts are agreed upon by bacteriologists and public healthmen concerned with studying and fighting it. From fatal cases of the disease a sub-microscopic infectious agent—a filtrable virus—can be passed to monkeys, giving them a similar paralytic sickness. It is further known that, though few persons in any given epidemic come down with paralytic signs of the disease, yet the virus may well be widely distributed in the population—infected but not visibly sick. This seems true because the majority of U.S. people, and the more the older, show virus-killing power in their blood in spite of the fact they have never shown paralytic sickness. Then too, in 1939, Kramer, Gilliam, and Molner—by using a new technique of passing the virus from humans to monkeys—have actually demonstrated the virus in the intestinal discharges of a large proportion of infants and children who had been in close contact with frank cases of the disease in an epidemic in Detroit, Michigan.

Does this mean that the frank cases had spread the virus to their neighbours, who were for some mysterious reason immune? Or that the healthy "carriers" had spread the virus to the non-immune children who became sick? This can not yet be answered. All that can be said is that, during an epidemic, the infantile paralysis virus can be found in a lot of healthy as well as sick people. Just the same, since Kramer and his co-workers and Drs. Paul and Trask, confirming them, have found the virus in the intestinal contents of people, it appears that public health measures controlling this source of exit of the virus from human beings will be advisable. Is the virus spread only by contact from person to person? This is not yet known. There may be still unsuspected animal reservoirs of the disease. Unsuspected insects may carry it. How does the virus get into people? This again is an open question. For some years it was generally believed that the virus—which is known to have a high affinity for nervous tissues—entered the human body only by the endings of the nerves of smell. In the laboratory, monkeys could be infected by dropping virus into their nostrils. But now a certain species of monkey—

Macacus irus—is found infectible by merely swabbing the virus lightly on its tonsils. And, at autopsy of children dead of infantile paralysis, little trace of invasion by way of the nerves of smell can be discovered. This calls into serious question the power of chemicals like zinc sulphate—powerful protectors of monkeys against infection by the nose route in the laboratory—to protect children during epidemics.

Since thirty years of laboratory research with monkeys have failed to give public healthmen means to control the disease, it is now demanded that scientists return again to the study of the disease in nature in human beings. A nation-wide co-ordinated plan of epidemic detective work is now under consideration by the National Foundation for Infantile Paralysis.

The discovery of a cheap and easily handled small laboratory animal, the cotton rat, brings hope for more rapid progress against this most mysterious of all infectious diseases during the coming years. Up till now, it must be admitted, we do not know how to prevent or to cure infantile paralysis. But the cotton rat discovery is putting new heart into hitherto baffled searchers.

Infant Mortality. Comparisons of infant mortality among communities are based upon the infant mortality rate, that is, the ratio of the number of deaths among children under one year of age to the number of live births. Thus, the United States in 1938, with 116,412 deaths under age one and 2,287,980 live births, had an infant mortality rate of 51 per 1,000. England and Wales had an infant mortality rate of 52 per 1,000 live births in 1938. Infant mortality varies widely among the countries of the world. New Zealand usually experiences the most favourable rates, that for the period 1936 to 1938 being 33 per 1,000. Chile, with a rate of 243 per 1,000 in the same period, is one of the countries with very high infant mortality.

Many countries of the Western world have recently experienced great improvements in infant mortality. Thus, England and Wales, with rates per 1,000 of 154 and 52 in 1900 and 1938 respectively, had a two-thirds reduction. The rate in the United States was practically halved over the years from 1915 to 1938, the fall being from 100 to 51 per 1,000. These notable decreases in infant mortality result principally from better sanitation and a general rise in the standard of living. Specific beneficial factors are the pasteurization of milk, systems of food inspection, the screening of dwellings to keep out flies, and the organization of agencies that provide prenatal and neonatal care.

The following infant mortality rates per 1,000 live births for the United States in 1917 and 1937 respectively indicate the extent to which various causes of death have shared in the general decline: Diarrhoea and enteritis, from 20 to 5; premature birth from 19 to 15; congenital debility, from 9 to 4; congenital malformation, from 6 to 5; bronchitis and bronchopneumonia, from 11 to 6; and influenza and lobar pneumonia, from 5 to 4. Infant mortality from injury at birth, which increased sharply from 1917 to 1931, has since been declining and by 1937 the rate had fallen to 4 per 1,000 live births. Other conditions with a consistent downward trend in their mortality are syphilis, tuberculosis and diphtheria. Declines in infant mortality have been relatively greater in the later months of the first year of life than in the earlier months.

Among Negroes in the United States, the infant mortality rate in 1937 was 83.2 per 1,000 live births, while among white persons it was only 50.3 per 1,000. (See also BIRTH STATISTICS.)

Initiative and Referendum. Federal: *Indian plebiscites* on constitutions resulted in 109 adoptions, 5 rejections; charters, 78 adopted, 3 rejected; October 28, proposed constitution rejected at Standing Rock Agency, 519 to 337. *Marketing quota referenda:* Tobacco (Flue-cured), October 5, c. 90% for, 10% against; (Burley), November 21, c. 80% for; Cotton, December 9, c. 91.4% for. *California:* November 7, five proposals submitted, three defeated, viz. (1) Constitutional amendment ("Ham and Eggs") 1,933,557 to 993,204; (2) initiated measure (regulation of chiropractors), 1,894,764 to 801,173; (3) (referred act) oil and gas control (indorsed by President Roosevelt), 1,755,625 to 1,110,316; two other referred acts to regulate personal property brokers were adopted: (1) 1,853,663 to 753,480; (2) 1,850,811 to 732,873; see "Popular Lawmaking in California," *Min. L. Rev.*, xxiii, 559 (Radin). *Connecticut:* In a total vote October 3, smaller by nearly 10,000 than that of the preceding election, the proposed council-manager charter, for Waterbury, was rejected (14,726 to 10,513). *Mississippi:* November 7, adopted (57,326 to 4,848) constitutional amendment authorizing devise, at least 90 days before testator's death, of not more than one-third of his estate to a "charitable,

religious, educational, or civil institution" even though he has direct heirs; a contrary art. (269) of the Constitution was repealed (58,354 to 4,847). *New Jersey*: June 20, adopted (457,225 to 301,128) constitutional amendment authorizing pari-mutuel betting at races; November 7, voted (391,604 to 344,483) \$21,000,000 relief bond issue. *New York*: November 7, adopted (1,225,495 to 594,811) constitutional amendment authorizing pari-mutuel betting at horse races; there were 2,173,422 void and blank ballots; see *Cornell L. Quar.*, xxiv, 1 (A. E. Sutherland); a referendum on reform of greater New York county governments, was prevented by a Supreme Court decision; Binghamton voted (11,831 to 6,913) for daylight saving; Mt. Vernon voted (7,562 to 7,484) to abolish the elective office of council president, but against election of members by wards (7,832 to 7,101); New Rochelle, by 9,643 to 4,124, and White Plains by 6,278 to 3,363, rejected proportional representation. Peekskill's charter, was judicially voided for failure to post required notices. (*Cortland v. Peekskill*, 102, *N.Y.L. Jnl.*, No. 135). *North Dakota*: June 11, rejected (165,851 to 41,152) (1) referred act to abolish grain storage commissioner's office; (2) municipal liquor control (170,538 to 41,814); (3) diversion of highway construction funds (172,513 to 39,789); (4) gross income tax, 168,976 to 36,117 (the last three were initiated measures). *Ohio*, November 7, rejected (1) State Bd. of Education Amendment (1,137,054 to 747,545); old-age pension amendment (1,546,207 to 464,670); (3) amendment to reduce number and localities of initiators (1,485,919 to 406,612); (4) proposed changes in civil service law (1,132,279 to 634,269). *Oregon*: July 8, Multnomah Co. Cir. Court upheld "anti-picketing act," adopted in 1938 referendum (*Am. Fed. of Labor v. Bain*, *U.S. Law Week*, vii, 126). *Pennsylvania*: September 12, some 500 municipalities voted under local option laws on the question of licensing the liquor traffic. (See Supreme Court decision of September 8). *Philippines*: Amendments of Constitution (sec. 1 [5] and sec. 3 of appended ordinance) by reason of changes in the Tydings-McDuffie Act, voted October 24 (1,393,453 to 49,633), and later approved by President Roosevelt.

Europe.—*Denmark's* proposed constitutional amendments, increasing the power of parliament's popular branch (*Folketing*) at the expense of the upper house (*Landsting*) failed of adoption for want of the necessary 45% of the eligible voters, although the actual vote was 966,277 (44.6% of the whole) to 85,770. *Poland*: On October 22, at an election in the Soviet-occupied areas for delegates to national assemblies to decide the question of joining the U.S.S.R., "official" (Soviet) candidates received in Western Ukraine, 90.93% of the 92.85% voting; in White Russia, 90.67% of the 96.67% voting. (See Lobingier, *The People's Law*, 1909).

Insurance, Accident and Health. A marked increase in the volume of accident and health insurance and the adoption of this type of insurance as a major "line" by many important American agencies were two important trends of 1939. Hospitalization plans, which had been regarded with misgiving by the accident and health fraternity, have actually turned to the benefit of the latter, because the widespread publicity given such plans has led to a greater receptivity on the part of the public toward accident and health policies. Insurance companies also looked forward during the year to receiving a greater proportion of the hospitalization business.

The non-profit associations themselves have found it necessary in many instances to adopt the basic operation plans of insurance companies for underwriting, settlement and administration.

Several life insurance companies entered the accident and health insurance business in 1939, two of them in the last 60 days of the year. There was also a tendency on the part of life insurance companies to re-enter the field of total disability insurance. (See also INSURANCE, AUTOMOBILE: *Great Britain*; LAW (CASE): *Insurance*.)

Insurance, Automobile. Severe competition was the keynote of the automobile casualty business of 1939. Extremely satisfactory results in 1938 were reflected in sizeable rate reductions, broadened coverages, and frenzied efforts on the part of most companies to increase their volume. The net result is that the public is now receiving more protection at a lower cost, while the premium writings of the companies will probably be lower in total than in 1938, and the ratio of losses to premiums will be higher.

Perhaps the most notable development in the automobile casualty field was the widespread adoption of a classification rating plan for private passenger automobiles based upon the use of the automobile, and the introduction of a rate differential based upon the number of miles operated. Another innovation was the general writing of medical payments coverage, providing for payment of medical bills incurred as a result of injuries sustained by passengers in the insured automobile. With the exception of a new coverage, granted without charge, providing reimbursement for transportation expenditures incurred by reason of loss of use of the automobile due to theft, there were no outstanding changes in the automobile fire, theft and collision field during 1939.

There were the usual number of laws proposed for further regulation of the business, but, aside from the adoption of financial responsibility laws by two additional States, no important changes in State regulation occurred.

(G. E. Ho.)

Great Britain.—Accident and motor insurance includes many different classes, some well established such as workmen's compensation and motor, and others still in process of development such as aviation, credit and contingency. This section of insurance continues to expand and to occupy an increasingly important place in the business. Figures published during 1939 of the business of British offices for 1938 in two of the chief sections, are given below with a comparison with the previous year.

	1938	1937
Motor	Net Premiums	Net Premiums
Employers' liability	£37,651,808	£37,318,352
	9,732,138	8,716,804

Motor business still greatly predominates, but is not now advancing so rapidly as hitherto. The figures in this section are derived from business transacted in all parts of the world, but the largest part of the revenue is provided from Great Britain and the Dominions, and the United States of America. Normally the growth of accident insurance continues steadily in all areas; both through the expansion of existing sections and the development of new ones. No review of the subject for 1939 can however ignore the widespread effect of the outbreak of war. Certain areas from which accident business had been drawn in the past were automatically closed to British offices as from September 3, and though these areas are but a small part of the whole, the effort to make up for the loss of business by extension in other directions is necessarily hampered by the dislocation due to war conditions. These considerations do not apply to the important American field, where trade conditions are likely to accelerate the rate of increase in accident insurance turnover.

In Great Britain and other European countries the progress of the business has already been greatly disturbed. This is prominent

in the motor section, where the volume of business has been substantially reduced owing to cars being laid up, while at the same time the number of road accidents has greatly increased owing to the confusion resulting in its early stages from "black-out" methods. The general financial stringency of the moment is likely to have some influence in reducing the volume of personal accident insurance.

(C. E. G.)

Insurance, Fire. The business of fire insurance during 1939 was distinguished by an increase of about 4% in the losses as compared with an increase of 10% in 1938 over 1937. For two years now the amount of losses has increased which lends some support to the conviction that, after almost a decade of very low loss ratios, the time has come when the loss ratio will begin to approach what might be called a more normal condition. It should be borne in mind that there have been no severe fires or conflagrations for so many years that some are inclined to think they may not occur again. That is probably not true. The conditions in the large cities are not more favourable, when it comes to resisting a conflagration, than they were some years ago. In fact, conditions are probably less favourable, due to the increasing age of many of the buildings and the fact that many are unrented at the present time and are not kept in the best condition. This is only conjecture, but it is worth thinking about. The expenses did not show any appreciable increase during 1939, but taxes do not seem to have reached their limit and have a tendency, of course, to push up other expenditures. Every piece of paper that is handled in business increases the general expense.

The fire insurance companies are not troubled any more than other investing bodies by the lack of securities which are paying what might be called a fair return. The low return on Government securities is only possible because there are not good investments in other fields; in other words, the Government for many years has not had much competition from other investments. The portion of the assets invested in Government bonds tends to increase slightly and will do so until a normal investment market is reached.

The tendency, noticeable for some ten years perhaps, towards protecting against many hazards under one cover has been accentuated very remarkably during the past year. The form known as the Extended Coverage Endorsement No. 4 is especially referred to. In one piece of paper it covers approximately ten kinds of loss to which the insured might be exposed. A few years ago the insured, in order to be completely protected, would have needed a separate endorsement or policy for each of these hazards; now protection against them can be secured in one endorsement and at a rate which is extremely modest. Perhaps this is one outstanding way in which the business of fire insurance is developing so as to serve the insured in a more thorough, yet simpler manner. It is not too much to be hoped that in time there will come a form of property insurance which will cover practically every form of risk to which the insured is exposed.

Another important development during 1939 was the adoption in June of a new fire policy by the Insurance Commissioners and Superintendents. At present there are in use in the United States some six standard policies, no one of which has ever won the approval of all the States and all the companies. The new policy, it is hoped, will take the place of these and in time will be in use throughout the country. (See also FIRES AND FIRE LOSSES.)

(E. R. H.)

Insurance, Life. During the year 1939 the legal reserve life insurance companies of the United States and Canada continued to make substantial progress. The total

amount of life insurance (excluding reinsurance) in these companies was estimated at nearly \$120,000,000,000 at the end of 1939, an increase of about 3% over 1938. The new (original) business issued during the year amounted to about \$12,000,000,000.

During the year 1939 these companies paid out to policyholders and beneficiaries the huge sum of \$2,850,000,000 and their assets at the end of 1939 totalled nearly \$31,500,000,000.

The mortality experience during 1939 was very favourable. The death rate from tuberculosis continued to decline to the lowest level ever recorded.

The great progress recently made in the scientific fight on pneumonia was reflected in record low mortality from this cause in 1939.

Safety campaigns, aimed at preventing automobile accidents, succeeded in keeping automobile fatalities at a low level (though not as low as in 1938).

The interest rate earned on the companies' investments continued its downward trend during 1939. While there was some improvement in corporate bond and note financing in the first eight months of the year (and also in the mortgage field), the companies, on the whole, continued to experience difficulties in finding an adequate volume of appropriate and remunerative investments for their new funds. Company holdings of United States Government securities increased less than in previous years, and comprise about 18% of the companies' assets.

The outbreak of hostilities in Europe raised a number of serious problems, particularly for Canadian companies. To protect the general body of policyholders against unusual war losses, all companies doing business in Canada adopted so-called war clauses for Canadian policies. These clauses do not affect the insurance so long as the civilian policyholder remains within the territorial limits of Canada, Newfoundland, and the United States; policyholders in military or naval service are also covered without any extra charge so long as they remain in these home areas, and in the event of going beyond the home areas may, under Ordinary insurance, pay an extra premium to continue the full death benefit abroad. Aviators can obtain full coverage in the home areas subject to an extra premium but not abroad. Since many residents of the United States may likewise be subject to a potential war hazard, a number of United States companies have also begun using various war clauses for policies issued to them. As a general rule policies issued prior to the outbreak of war are not subject to any war restrictions, except in the case of supplementary disability and accidental death benefits.

In the State of New York, whose importance is far reaching as respects life insurance, a general recodification and revision of the Insurance Law was enacted during 1939, effective in most instances Jan. 1, 1940. With regard to the provisions of the law relating to the life insurance contract, non-forfeiture benefits, participation, etc., no fundamental changes from the present law were made but the new code embraces several subjects new to the statute. Among the more important changes of special interest were provisions relative to the insuring of minors and the inclusion of standard provisions for industrial insurance and total and permanent disability benefits. In April 1938, President Roosevelt sent a message to Congress with the request that certain investigations be made in connection with monopolies and, in addition, that the Securities and Exchange Commission be authorized to study insurance investments "with particular relation to their use as an instrument of economic power." Subsequent thereto Congress created the Temporary National Economic Committee to make the authorized investigations and the Securities and Exchange Commission began systematically to bring together information, which dealt not only with insurance investments, but

practically all phases of the life insurance business, for the purpose of submitting material and witnesses during hearings before the Temporary National Economic Committee. These hearings took place intermittently from Feb. 1939 up to and beyond the end of 1939.

Evidence was adduced from officers and other representatives of life insurance companies and tabulations and analyses were prepared and presented by members of the staff of the Securities and Exchange Commission. Those interested in life insurance were asked to present for the record any additional testimony.

(L. A. L.)

Insurance, Marine.

It is a regrettable fact that in 1939, as in the previous year, marine underwriters were compelled to devote most of their time to consideration of problems in connection with war.

In the early part of the year the British Government announced the formation of a War Risk Pool to cover all shipments to and from Great Britain. The reason for this was that the British Government was most desirous of having British commerce continue to move in as nearly a normal manner as possible regardless of political conditions throughout the world. This action of the British Government was promptly followed by the governments of other maritime nations in Europe adopting somewhat similar plans. They were all desirous of protecting their foreign trade and their merchant marine against the perils of war.

A war risk bill was introduced in both the Senate and House to put the United States Government in the marine insurance business particularly in respect to war risks. Although the House committee on Merchant Marine held extensive hearings, no action was taken on this bill prior to the adjournment of Congress. However, marine underwriters in the U.S. realized that American importers and exporters must be maintained in a competitive position in their world-wide trading and formed the American Cargo War Risk Reinsurance Exchange with an unlimited capacity to handle all the cargo war risk business written in the United States. Practically every insurance company authorized to write ocean marine insurance in the United States is a member. It is somewhat of an undertaking to have every cargo war risk line written anywhere in the U.S. by the thousands of insurance agents promptly reported to one central office and there sorted for each sailing of each ship no matter from what port or to what port the voyage is made and further reporting to each insurance company member its share of every sailing. However, this was accomplished and the Exchange was in full operation when the European war broke out in 1939. It was most fortunate for all persons engaged in the U.S. foreign trade that the marine underwriters were organized and prepared to meet the shock. There was none of the confusion and uncertainty that prevailed in the marine insurance business in August and September of 1914. But the outbreak of this war put a tremendous burden on the underwriters, meetings of committees have been numerous, the rate committee supervising the rates for American flag, other neutral and belligerent ships have met daily to consider rates to and from all parts of the world and putting them up or down in accordance with what, on the best available information, was considered the real hazard. However, both importers and exporters have an adequate market for their war risk requirements and commerce has not been curtailed in any manner by lack of war risk insurance facilities.

The strictly marine insurance on cargoes as distinct from war risk continues along without change. There has been no increase in rates although there has been a substantial increase in risks brought about by conditions at piers in all ports, and increased navigational hazards. It is probable that when underwriters can find the time to do so consideration will be given to marine rates.

Hull business which is handled by the American Marine Insurance Syndicates has been given careful consideration. The record of each fleet has been examined and where the record has not been good the rate has been increased. Although the trend of rates for the past two years has been upward it is doubtful if the increases obtained have been equal to the increased cost of repairs which due to war conditions will probably be higher than ever in 1940.

Interior Decoration. Outstanding events were the two World's Fairs. The one in New York, from a decorative standpoint, was disappointing. The scattered plan, the absence of adequate vistas, with a few exceptions, and the effort to be modern without sufficient understanding of underlying principles were regrettable and it seems unfortunate that the Town of Tomorrow, as someone said, "seemed to be designed by the architects of yesterday." The chief accomplishment was the dramatic and beautiful use of indirect and fantastic lighting and the successful use of sculpture as well as the sheer loveliness of the landscape planting. The American public suddenly became aware of colour in architecture and decoration. However, taken as a whole, there was a lack of distinction and real beauty.

But individual achievements stand out—the very real elegance of the Swedish pavilion, light, gay and in the happiest accord with the feeling of exhibition architecture—the lighting of the paintings in the Italian building—the Danish silver—the birch-log disc wall surface in the Finnish pavilion—and such sophisticated notes in the French pavilion as the brilliant green leather commodes tooled in gold against a white and gilt boiserie, the amusing ante-room, painted in trompe l'oeil to represent windows and cabinets filled with decorative objects, and the astounding execution of the red velvet architecture in the dressmakers' exhibit. At the San Francisco Fair, one remembers the beauty of the planting—not mere groups of flowers and shrubs, but a handling that displayed each separate plant-entity as brilliantly as though it were made of porcelain. The Industrial Arts Exhibit was delightful and the display in the American Indian building was handled with exquisite perfection and will probably be the forerunner to the use by decorators of Indian art. The lovely coloured backgrounds used for the display of the paintings in the art exhibit were a joy. Each picture shone, and the eye-tiring effect of the customary museum wall was absent. Another outstanding success was the Yerba Buena Club—the gilded exteriors with ramps in place of steps, the brilliant interiors with plaster furniture in metallic colours, the seashells worked into swags and decorations, the use of one colour against white for dramatic effect.

Looking back on domestic decoration in the popular field, one sees a heartening absence of the usual much-touted "trends." Are people at last refusing to be hypnotized by standardized "magazine taste"? It would seem that even though less money may be spent, ingenuity may give rooms that are lighter, fresher, and gayer, more individual—and consequently more interesting.

Another gratifying sign is the increasing conviction among business men that taste can sell a product. Ten years ago, it was not possible to decorate a hotel in any but a thoroughly vulgar fashion—a vast baronial lobby, a huge and echoing dining room, cramped and dreary bedrooms. Now fresh, lively colour can be used, together with amusing materials and furniture once considered impractical.

Above: EDWARDIAN DRAPERIES and a red-and-white Regency sofa featured a model "trend house" exhibited in 1939 at Chicago

Right: "BREAK-FRONT" DESKS were conspicuous in 1939. Hardware was replaced in many modern pieces by grooved finger niches

ADAPTATIONS OF THE REGENCY MODE, with non-essential decorations stripped off, were featured in 1939

Right: THE TEA WAGON returned to favour in 1939, for use also as an auxiliary table

Yet, notwithstanding these encouraging signs of change, one is still forced to acknowledge that all too often the designer's skill does not keep up with the scientist's invention. Among the new materials, for example, there is a crystal-clear, light, unbreakable and fireproof plastic. Instead of using it in a modern fashion, expensive chairs are being made of it . . . modelled after those of Victorian-cum-Baroque inspiration!

In 1939 increased emphasis was made on the living room as the centre of the house. Going back to the 18th century, the bed-chamber was all-important. In the Victorian age the dining room was featured. Today we have seen the rise of the private bar, the decorated bathroom and the "fun room," each as the mark of having arrived financially. Today, the big comfortable room, arranged for music, bridge or conversation takes the lead in any decorative scheme, particularly in circles where fashions begin. For once again people have begun truly to live in their houses, entertaining there in a manner that combines informality with good taste. The revival of that queer old-fashioned creature, "the lady," has been a pronounced influence—popularizing colour that is clear without being strident, forms that combine comfort with grace, and such amusing touches of fantasy as imaginatively designed hand-woven fabrics, Baroque plaster-work, Venetian blackamoors and candlelit chandeliers, in the same room with modern paintings.

(D. DR.)

International Labour Organization. The I.L.O. again in 1939 was the largest and most important "going concern" in international affairs. Despite the outbreak and spread of wars, declared and undeclared, in Europe and Asia, the I.L.O. gained in prestige, and promised greater usefulness in economic co-operation, in dealing with war-time labour problems, and in promotion of social justice as a basis of world peace.

The International Labour Conference, 25th session, June 8–28, Geneva, Switzerland, had 362 representatives present; 154 delegates—Governments, 86; employers, 34; and workers, 34, and adopted by a two-thirds vote 4 conventions, and 10 recommendations. The director's report noted membership decline due to war, and inability of some to pay dues, but increased demand for service which no other agency can render. "Twenty Years" since the First Conference (Washington, D.C., 1919) was the title of one section showing a record of marvellous achievement, the unique value of the tripartite principle basic in the I.L.O. structure whereby the representatives of Governments, employers and workers meet as equals for discussion and action on vital common interests of all.

Improvement of I.L.O. technique and widening of scope have given national labour legislation everywhere, and its application, a new meaning and practical universality undreamed of two decades ago. Through 67 conventions with 865 ratifications (Dec. 1939), solid foundations have been laid for an international labour code on work hours, freedom of association, women and child wage-earners, indigenous workers, maritime workers, social insurance, and other essentials of human welfare. In addition, recommendations adopted with equal care and deliberation help apply conventions or deal with matters not ripe for conventions. Finally the world's best research agency has made a good start in establishing an international civil service.

While war clouds were still afar, the governing body (I.L.O.) at its first meeting after Munich (London, Oct. 1938) set up an Emergency Committee (4 Government members, 2 employers, 2 workers) to make plans for I.L.O. work in war time, and to take over functions of the governing body if it became too difficult for full membership (32) to meet. Both emergency committee's and director's reports were debated at the 1939 conference by 60

delegates representing over 30 nationalities. Net result: enthusiastic, practically unanimous decision that I.L.O. must go on; the staff remain in Geneva as long as possible; war-time labour problems to be studied as a service of highest importance in preparation for eventual peace; normal services to neutrals continued and expanded despite financial difficulties.

Assurances of support from Governments were received from 31 member states by mid-October. Second Regional Conference of the Americas met in Havana, Cuba, in November. All American member states (16) joined in "Declaration of Havana" pledging "unwavering support" to I.L.O. More significant in both cases pledges were equally strong from employers, and even more so from workers.

Not only does the able and courageous leadership of the new American director, Governor Winant, in this difficult first year of his administration, and the fact that the centre of gravity of the I.L.O. is moving naturally westward, impose new duties on the U.S.A., but also they create new opportunities for service to humanity to which the strongest neutral and peace-loving nation in the world should not be slow to respond. (See also CHILD LABOUR; CHILD WELFARE; LEAGUE OF NATIONS; REFUGEES.)

(S. MCC. L.)

International Law. The outbreak of a new European war in 1939 at once raised inter-belligerent questions and belligerent-neutral questions. So far as concerns the belligerents, they appear to have started where they left off in 1918. In England, orders in council were issued seeking to prevent any cargoes from reaching Germany directly or indirectly, and imposing even an embargo on German exports, directly or indirectly. This could not be justified either under the law of blockade or contraband. There was no legal blockade, which requires ships, maritime or air, in close proximity to the port. The contraband lists were so far-reaching in their scope as hardly to admit of legality. Articles of distinctly military value may be included in such lists—not more. Otherwise the principle is broken down. The prohibition of trade to neutrals also has no authority. An embargo on exports has no legal authority. Only a lawful blockade could accomplish that. On the other hand, the German mining of the open seas with mines that became detached, was in violation of the Hague Conventions. So also was the unwarmed sinking as reported, of neutral vessels. On this topic, the facts are still somewhat unclear. Armed belligerent merchant vessels may be attacked without warning, and if some are armed a submarine may presume that all are armed. In the first weeks of the war, submarines appear to have stopped vessels for visit and permitted removal of passengers and crew when sinking was undertaken. This practice appears to have been suspended after the first few weeks.

For the United States, the most important event was the lifting of the arms embargo last established by the law of May 1, 1937. Much controversy preceded the step. It was argued by eminent lawyers that inasmuch as the motive was to enable the Allies to obtain arms and ammunition which in any event the Germans could not get and possibly might not want, the step was unneutral in motive and hence illegal for a neutral to undertake. On the other hand, it was argued that motives of a legislature cannot be questioned. The Senate report erroneously stated that the shipment of arms conformed to the practice of international law. International law permits a nation to pursue any policy that it chooses in this respect. Smaller neutrals have often declared arms embargoes. Other material changes in the Act of 1939 were the authorization to the President to declare combat areas from which American vessels were to be excluded, and the restoration of the cash-and-carry plan which had expired on May 1, 1939. By that

plan all American goods had to be transferred to foreign ownership before leaving the United States and cash had to be paid. No munitions could be carried by American vessels. Executive proclamations were issued from time to time to carry the Act into effect. Objections have been raised in various quarters to an unneutral administration of the Act. For example, complete bombing planes are being supplied to the Allied Governments. On the analogy of the prohibition of the supply of maritime warships, the legality of such supply has been said to be doubtful. It is prohibited by Article 46 of the Draft Convention on the Use of Radio and Aircraft in Time of War, adopted at The Hague, 1922. Merchant vessels armed with four six-inch guns are admitted to American ports as if they were peaceful vessels. The Havana Convention, Article 12, prohibited this, but the United States made a reservation, hence is not bound. The Panama Declaration of Oct. 1939, varied from the Havana Convention by permitting the admission of armed merchant ships provided they are armed for defence and at the stern only. The several countries of Latin America and the neutrals of Europe have indicated what they meant by "defence." Inasmuch as Secretary Lansing on Jan. 18, 1916, pointed out the impracticability of the distinction between offensive and defensive armaments in connection with submarine warfare, and as Holland refused to admit any armed ships to her ports, the distinction may not be sustainable.

In the Declaration of Panama and by diplomatic representations of the American countries, an effort was made to induce the belligerents to commit no belligerent act within an area around the American continents estimated as varying between 200 and 400 miles. Hostilities were to be kept out of what was called American waters. The case was pressed, especially after the engagement between the "Admiral Graf Spee," a German warship, and three British cruisers off Montevideo. The European belligerents have been loath to concede the claim, which does not strictly rest on legal grounds. There appears to be no immediate intention to enforce the claim.

The Russo-Finnish war broke out in Nov. 1939, but the Neutrality Act was not invoked because allegedly war had not been declared. Most wars are undeclared. A \$10,000,000 credit was set aside for Finland by the Export-Import Bank, and aircraft intended for the United States was released to Finland. A further Government loan is under discussion (Jan. 1, 1940). These aids to Finland have been challenged as unneutral.

Seizure of United States mails by the belligerents has been challenged by the United States as illegal under the Hague Convention, which exempts letter mail from search. The belligerent argument is that money and valuables may be concealed in the mail and that only opening it can determine content. The draftsmen of the Hague Convention were aware of that fact, and it appears that they intended letter mail to be immune. Parcel post, it has been admitted, may be examined for contraband.

The recognition or non-recognition of foreign conquests in the case of Albania, Czechoslovakia and Poland, all in 1939, presented problems for the Department of State. In Albania the American legation was closed, which may be evidence of recognition. In Czechoslovakia the legation was closed, the trade agreement with Czechoslovakia suspended, but this was explained as an admission of facts only, and not a *de jure* recognition of the legality of the occupation of Czechoslovakia. In the case of Poland, the Polish Government in Paris continued to be recognized as lawful, but it will probably be necessary to deal with the occupation as a *de facto* situation.

During the year, decisions of the Supreme Courts of Mexico and Bolivia failed to set aside the executive expropriation in Mexico or the executive cancellation of the oil concession in Bolivia. The Mexican decision of Dec. 2, 1939, was placed on the

ground that vast expropriations beyond the capacity of Mexico to pay for, are not covered by the literal requirements of Mexico's Constitution, but that deferred payments would satisfy the case and that if the payments cannot be made out of the proceeds of expropriated oil, then the companies would have a claim against the Government for the balance due. The court also held that the subsoil petroleum was not the property of the owners or lessees of the surface and that the abrogation of the exclusive right to extract it was not a taking of oil or of property. These contentions the United States has not admitted, and although Mexico contends that there is no denial of justice involved since the valuation of the surface properties is not yet completed, it is likely that the United States may take a different view.

In the case of Bolivia, the Supreme Court did not pass on the merits of the case but merely held that the company's representatives had improper powers of attorney and that the transfer of the concession from Richmond-Levering to the Standard Oil Company of Bolivia was invalid since it was not approved in advance by the Bolivian Government, but only ratified subsequently. This matter may be submitted to arbitration.

International law problems arising out of the Spanish Civil War concern mainly the effort of the successful Franco Government, recognized without difficulty as the Government of Spain, to reach property abroad held in the name of Spain or of the replaced Loyalist Government.

On July 26 the commercial treaty with Japan of 1911 was denounced by the United States, to take effect at the expiration of six months. Article 5 of this treaty was in conflict with the moral embargo declared by the American Executive on various types of war materials to Japan. The abrogation of the treaty was understood to clear the way for further acts of reprisal which could not then be charged as treaty breach. Whether embargoes or other reprisals will be undertaken is still an open question. It is part of the diplomatic contest between the United States and Japan.

The sabotage claims for the recovery of some \$50,000,000 for two explosions which occurred in 1916 and 1917 were decided in June 1939, by the American Commissioner and Umpire Roberts after the resignation of the German Commissioner. This decision undertook to reverse a unanimous decision arrived at in 1930 by a commission of two Americans and a German. Important questions of international law have been raised as to the power of the new commission to set aside the original award and the power of two commissioners to act in the absence of the third. Diplomatic protests have been entered and a court action begun. The matter is still pending.

On Feb. 17, 1939, the Dominican Republic paid Haiti \$275,000 in compromise settlement for the killing of Haitians by mob actions in 1937.

In the case of *Moscow Fire Insurance Company v. Bank of New York and Trust Co.*, 280 N.Y. 286, the United States Government intervened as assignee under the Litvinov agreement of 1933 of assets of the Soviet Government in this country. It was argued that the surplus assets of liquidated Russian corporations were the property of the Soviet, hence now of the United States. The New York Court of Appeals rejected this argument, declined to give effect in New York to a Russian confiscatory decree, and ordered that distribution of the surplus assets be made to foreign creditors and stockholders of the fire insurance company. The decision seems sound.

In the case of *Elg v. Perkins*, 307 U.S. 325, the United States Supreme Court held on May 29 that a child born in the United States of alien parents does not lose his American citizenship when the alien parents return to their native allegiance abroad, even when they take the child along, and that the child has until majority to elect whether to return to the United States to resume the

duties of citizenship. In so concluding, the court reversed a ruling of the Department of State and in addition sustained a declaratory judgment against the Secretary of State that he may not refuse a passport on the ground that such a person is not in law a citizen. This establishes a new precedent to the effect that the Secretary's decision, heretofore unreviewable in the matter of passports, may be reviewed by declaratory action if the refusal is based on a legal ground. (See also NEUTRALITY; PACIFISM.)

(E. Bd.)

International Peace Campaign: see PACIFISM.

International Trade. The history of world trade in the years 1937-39 clearly illustrates the growing interdependence of nations as well as the leading roles of the United States and the United Kingdom in world economy. The United States consumes a larger proportion of the world's raw materials than any other country, probably as much as 40% of the total, while the United Kingdom is the greatest importer of foodstuffs and likewise imports large quantities of raw materials, and their combined purchases abroad exert a stimulating influence on the economy of other nations.

The remarkable progress of economic recovery in the United States and the United Kingdom, which began in 1935 and continued well into the autumn of 1937, and the resulting intense industrial and commercial activity brought the volume of international trade in 1937 very near the high levels of 1928 and 1929, although the monetary value of the trade was about the same as 30 years ago when prices were much higher. The aggregate trade of 109 countries, imports and exports combined, had a value in 1937 of about 31,153,000,000 gold dollars, an increase of 23.5% over 1936, due partly to higher prices, but in a greater measure to a larger volume of trade.

The decline in industrial production which ensued late in 1937 depressed the prices of raw materials and reduced the volume of trade. Trade was affected adversely also by the war in Spain and China, and the war scares in Central Europe where old-

established trade connections were disrupted by the annexation of Austria to Germany, the dismemberment of Czecho-Slovakia, and the forced liquidation of many Jewish firms, both industrial and commercial. The aggregate value of world trade in 1938, approximately 27,072,000,000 gold dollars, was 13.1% below the total for 1937.

The year 1939 was a war year. Every day throughout the year potential producers and consumers were being killed somewhere in Europe or Asia, and wealth destroyed to make an impoverished world still poorer. The absorption by Germany of Austria, Czecho-Slovakia, and the invasion and partition of Poland reduced their share in world trade heretofore amounting nearly to 4% of the total. After the occupation of Bohemia and Moravia by the German Army in March some of the foreign orders for Bohemian glass and linen goods were diverted to Belgium, but many others were simply cancelled. Exact data on international trade in 1939 will probably never be known, as trade statistics are one of the casualties of the war. Germany and Italy stopped publication after the issue of the July summaries, and the Soviet Union did not issue a report on 1939 trade. However, on the basis of the data available it may be estimated that the total value of world trade in 1939 will not exceed 26,400,000,000 gold dollars, though its volume may be slightly larger than in 1938.

This estimate is based on the figures presented in the tables herewith. Table I shows the value of the trade of 40 countries for the first seven months of 1938 and 1939. The countries are ranged in descending order according to the gold value of their foreign trade, imports and exports combined. The total in millions of the old United States gold dollars has been obtained by converting the amounts in original currencies at average rates of exchange. Of the countries listed, 17 show increases in 1939 while 23 show decreases; in 11 cases, however, the changes are small. The aggregate trade of the 40 countries shows a decline of \$340,013,000, gold, or 2.36%. As the prices prevailing in the first half of 1939 were about 8% below the prices of the first half of 1938, it is evident that the volume of trade was about 6% larger in 1939. The total decline in value was more than accounted for by the decreases in the trade of the United Kingdom, Germany, Czecho-Slovakia, and Australia.

Table II shows the trade of 23 countries for the first nine months of 1938 and 1939. The aggregate gold value of the foreign trade of these countries was \$11,252,994,000 in 1939, as against \$11,548,007,000 in 1938, a decrease of 2.56%. Of the countries listed, 11 show a gain of \$227,508,000, gold, in 1939, the principal gainers, in absolute figures, being Japan, the United States, the Netherlands, Canada, Sweden, and Hungary. Only in the cases

of Hungary and Japan, however, did the gain exceed 10%; in all other cases the relative increase was less than 5%. The other 12 countries show a reduction in the total value of their foreign trade of \$522,521,000, gold, the principal losers, in absolute figures, being the United Kingdom, Australia, Argentina, Belgium and Greece. In the cases of Australia, Greece and the United Kingdom the decline was in excess of 10%; the trade of Argentina decreased 6.8%; in all other cases the loss was less than 5%. The total net loss was \$295,013,000.

The trade figures shown in Table I and Table II appear to warrant the conclusion that the value of world trade in 1939 will be about 2.5% below the total for 1938. The war in Europe may stimulate the demand for war materials in the last quarter of the year but at the same time it may reduce the consumption of other goods in the belligerent countries since they may be constrained to use a much larger proportion of the national savings to pay for the war. It is interesting to note that international trade declined in Sept. 1939 although—or because—the prices of many leading commodities increased sharply in that month after the German armies had invaded Poland, and the United Kingdom and France declared war on Germany. Lard, wheat, maize, rice, sugar, coffee, tea, cacao beans, hides, rubber, cotton, jute, wool, silk, copper, tin, lead and zinc, all were quoted higher on the free markets in September. In view of the great value of international trade in promoting the welfare of nations it is rather discouraging to see the attempts of so many countries to reduce or destroy the benefits of the international division of labour and exchange of goods by high taxes, quotas, foreign-exchange restrictions, direct prohibitions and other means. The international monetary and trading mechanism has been disrupted, and international co-operation abandoned in a world crisis when such co-operation appears to be more necessary than ever. The United States alone is making consistent efforts to lower trade barriers by reciprocal trade agreements with concessions applicable to all countries not discriminating against the signatories. In many countries "economic nationalism" is rampant; it involves attempts to make countries self-sufficient by using home-made substitutes in the place of imported products. It is a sort of military economy, as it seeks to husband domestic resources for the purposes of war.

"MEN WILL BE BOYS." A cartoon comment by Thomas of *The Detroit News* upon the United States' announcement April 24, 1939, that it would barter products with Great Britain, Belgium, and The Netherlands

In most cases the substitute articles are not only of lower quality but also costlier than the genuine products; in normal times they would be classed as adulterated merchandise, and their sale prohibited. But the times are not normal when the garrison states openly proclaim their plans to conquer the world, and their regimented economy disturbs and reduces the natural flow of trade. It may take a generation before relative freedom in the international exchange of goods is restored. (See also EXPORTS AND IMPORTS.) (J. J. K.)

Interstate Commerce Commission: see GOVERNMENT DEPARTMENTS AND BUREAUS; RAILROADS.

Intoxication, Alcoholic. Medical literature during the twelve-months' period ending Sept. 30, 1939, dealing with alcoholic intoxication, concerned itself largely with the subject of chronic alcoholism. However, the wider use of chemical laboratory techniques in the diagnosis of acute alcoholism incident to the enforcement of automobile traffic regulations resulted in an increased literature on that phase of the subject.

The latter tended in the direction of bringing about greater uniformity in diagnostic criteria and improvements in the technique of assembling and presenting admissible evidence in a court of law. In general there has been a greater tendency for courts to admit, as evidence, the results of chemical tests of the blood and urine used in the diagnosis of acute alcoholism. Of greater significance, however, is the increasing trend of "pleas of guilty" to charges of "drunken driving" when the alleged offender is confronted with the results of chemical tests. The generally accepted rates of alcohol concentration in the blood and in the urine is as 1 is to 1.35. Blood concentration may exceed that of the urine if the tests are made within two hours subsequent to drinking. At the end of that period, alcohol in the body tissues and fluids tends to reach an equilibrium, the accepted elimination rate being 20 milligrams per hour thereafter.

However, it is generally conceded that the action of alcohol upon man is dependent upon a variety of factors and that differences in reactions obtain in different individuals and in the same individual at different times. In consequence there is some difference in opinion as to what constitutes "acute alcoholism" from the standpoint of alcohol concentration in body fluids. In general, blood concentration of 0.20% alcohol correlates with clinical evidence of acute intoxication, whereas 0.1 percents are borderline.

Experimental evidence has indicated that insulin is necessary for the oxidation of alcohol within the body. Its clinical use, combined with dextrose intravenously, tends to increase the rate of disappearance of alcohol from the blood.

There are indications that chronic alcoholism is being regarded, more and more, as a medical problem, through the wider use of hospitals and institutions ministering to the sick as shown by the increased admission rate of alcoholics. Moreover a recent court decision established a precedent by a ruling that chronic alcoholism is not a self-inflicted disability, but a disease.

Differences of opinion have obtained since 1928 when, on theoretical grounds, vitamin deficiency was first mentioned in the literature as an etiological factor in alcoholic neuritis. This conception has been substantiated not only with reference to neuritis but with reference to other physical and mental phenomena associated with chronic alcoholism. Afflictions such as polyneuritis, pellagra and other deficiency syndromes proximal to alcoholism are the results of a deficiency in the vitamin B complex. This is in part the result of an inadequate intake. The cevitic acid content of the blood in some alcoholic psychoses has been reported as low as that seen in subclinical scurvy.

The trend in the direction of the biochemical approach toward a better understanding of the nature of the physical disorders associated with chronic alcoholism influenced the management and treatment of delirium tremens and the polyneuritic complications, including cardiovascular and other disturbances seen in the chronic habitué. Thus, delirium tremens is characterized by dehydration, diminished blood chlorides, acidosis and by either a definite or partial multiple vitamin deficiency involving mainly the vitamin B complex, treatment being directed toward the correction of these adverse conditions.

The treatment of polyneuritis and other physical complications of alcoholism has centred about the use and value of vitamin B alone (Theamin) or in combination with a diet rich in vitamin content or with the use of the latter alone.

In general the literature on chronic alcoholism, as in previous years, was concerned with the need for a more adequate public policy for the protection of the general public and the protection and rehabilitation or reclamation of those addicted. No new principles were evolved, however.

Inventions: see PATENTS.

Iodine. Chile, formerly the producer of almost the entire world supply of iodine (a by-product in the treatment of caliche for the recovery of sodium nitrate), now has active competition in the market from the United States, Java, and Japan, and small amounts for local consumption are produced in Italy. The Italian output is of the order of 25-30 metric tons and the Javanese 100 tons annually; that of the United States was 135 tons in 1937, increasing in 1938; Japan produced 48 tons in 1937. Chile is still the main source of supply, with an output that ranged from 500 to 1,000 tons before active competition began in other countries; sales in the fiscal year 1937-38 were 832 tons. Outside competition reduced the price to 81 cents per pound in 1936, rising in 1938 to \$1.02. (G. A. Ro.)

Iowa, north-central State of the United States, popularly known as the "Hawkeye State"; area 56,147 sq.mi.; population (U.S. census, 1930) 2,470,939; (estimate for 1938) 2,561,000. Capital, Des Moines, 142,559, the only city in Iowa with a population over 100,000. Of the State's population in 1930, 979,292 were urban or 39.6%; 2,448,382 whites; 22,557 coloured; 2,282,647 native born whites; 165,735 foreign born whites.

History.—The officers elected on Nov. 8, 1938, who took office in Jan. 1939, are: governor, George A. Wilson; lieutenant-governor, B. B. Hickenlooper; auditor, C. B. Akers; treasurer, W. G. C. Bagley; secretary of State, Earl G. Miller; secretary of agriculture, Mark G. Thornburg; attorney-general, Fred. D. Everett; and superintendent of public instruction, Jessie M. Parker. All are Republicans. A State conservation commission, a State board of social welfare, a State commerce commission, a State planning board, and an Iowa unemployment compensation commission were created or reorganized by the General Assembly in 1937, but the planning board was abolished in 1939. The State highway commission is located at Ames, Iowa; all the other boards and commissions have their headquarters at Des Moines. Funds for the State are provided by taxes on property, incomes,

retail sales, corporations, gasoline (State tax 3¢ per gal.), and inheritances. There are limited exemptions on homesteads. By July 1, 1939, 5,134.9mi. of primary roads of Iowa were paved and 3,275mi. were gravelled or otherwise surfaced. Of the secondary road system, 35,586.26mi. were gravelled and 26.5mi. were paved. Highway construction on primary roads in 1938 cost \$12,979,376. From Dec. 1, 1938 to June 30, 1939, construction costs on primary roads amounted to \$4,275,210.23. The State highway patrol has a staff of 103 men.

Education.—The superintendent of public instruction reports for the school year, 1937-38, 8,761 rural schools in Iowa, 1,701 graded schools, and 945 approved high schools. The total number of children of school age (5-21 years) was 681,169. Of these 519,150 were enrolled in the public schools, and 1,880 in public junior colleges. The teachers in the public schools, exclusive of junior colleges, numbered 25,065; and the cost of the public schools for 1937-38 was \$41,296,626.01, raised largely by the general property tax in local districts. For the school year 1938-39 the total attendance at the three State-supported institutions of higher education under the State board of education (the State university at Iowa City, the State College of Agriculture and Mechanic Arts at Ames, and the State Teachers college at Cedar Falls) was 21,861, with over 35,000 in addition attending short courses and conferences at Iowa City and Ames. There are also some 20 privately supported colleges in the State. Iowa ranks first among the States in literacy with only .8 of 1% illiterate.

Charities.—A State board of social welfare, composed of three members appointed by the governor (King R. Palmer, chairman), administers old age assistance, aid to the blind, aid to dependent children, child welfare, and emergency relief. Working with it are local boards in the 99 counties. The board of control (D. R. McCreery, chairman) has charge of the State's penal, correctional, and eleemosynary institutions. Statistics for these as of Nov. 30, 1939, were as follows: Men's Reformatory, Anamosa, 1,129; State Penitentiary, Fort Madison, 1,455; Women's Reformatory, Rockwell City, 81; Training School for Boys, Eldora, 594; Training School for Girls, Mitchellville, 111; State Juvenile Home, Toledo, 274; and Soldiers' Orphans' Home, Davenport, 535. The four State hospitals for the insane had 6,462 inmates.

Banking and Business.—There were 108 national banks, 296 savings banks, 239 State banks, and 3 trust companies doing business in Iowa in 1939. On June 30, 1939, the 538 State institutions had total deposits of \$401,323,567.84, an increase of \$25,447,464.84 over those of the previous year. At the same time the deposits in the national banks totalled \$236,730,000. Approximately 80% of the deposits in State banks and 58% of those in national banks were protected by Government insurance. Farm prices through Oct. 1939, decreased 9.2% from those for the same period of 1938, but farm income (through October) increased 13.6%.

Electric power production for the first nine months of 1939 showed an increase of 1.9% over the same period of 1938. Building contracts in general increased 5.7%, and residence building showed an increase of 28.8%, but business building contracts showed a decrease of 3.4%. Life insurance sales increased 7%, department store sales, 2.3%, employment 2.8%, industrial payrolls 6.5%, automobile sales 31.1%, and bank debits 6.5%.

Agriculture.—There were 209,709 farms in Iowa in 1939 with

	Acres	Total Production	Total Value
Corn	9,688,000	503,776,000 bu.	\$267,001,000
Oats	5,076,000	154,818,000 bu.	41,801,000
Hay (all kinds)	3,633,000	5,098,000 tons	27,640,000
Wheat	390,000	6,490,000 bu.	4,218,000
Barley	563,000	13,794,000 bu.	5,242,000
Rye	72,000	1,044,000 bu.	365,000
Potatoes	56,000	5,600,000 bu.	4,200,000
Soybeans (for beans)	487,000	10,227,000 bu.	7,670,000
Soybeans (for hay)	626,000	939,000 tons	5,250,000

34,402,853 ac. of land. Slightly more than 57% of this land was farmed by tenants. Crops in Iowa were unusually good in 1939. The figures on the preceding page indicate the production and value of the principal crops for 1939 as reported at the close of October. On Jan. 1, 1939, there were 8,179,000 hogs on Iowa farms, 1,710,000 sheep, 4,465,000 cattle, 783,000 horses and 55,000 mules. During 1938 Iowa farmers marketed 9,612,000 hogs, 1,903,500 cattle, 305,600 calves, and 1,440,600 sheep and lambs.

The total cash income of Iowa farmers for Jan.-Oct., 1939 was \$487,112,000, as compared with \$576,744,000 for the entire year 1938, \$522,356,000 for 1937, \$569,000,000 for 1936, and \$528,495,000 for 1935. Of the income for the first ten months of 1939, approximately \$353,570,000 came from livestock and livestock products, \$95,008,000 from crops, and \$38,534,000 from Government payments. On Jan. 1, 1939, there were 197,556 automobiles, 19,779 auto trucks, and 110,831 tractors owned on Iowa farms. Farm-owned radios numbered 150,887. Some 49,000 farms were electrified.

(B. F. S.)

Iowa, State University of. First State university to admit women on equal standing with men, it is located in Iowa City, a community of 17,000 persons 55 mi. west of the Mississippi river. Iowa's first general assembly established the university Feb. 25, 1847.

Enrolment in 1939 for the fourth time passed the 10,000-mark, although the figure of 10,336 for the 12 months ending in June was short of the record established two years before. The university granted the second-greatest number of degrees in its history, 1,730, of which 650 were advanced awards.

Demand for additional dormitory space resulted in the completion of an addition to Hillcrest, men's dormitory, to accommodate 222 men, and to Currier Hall, to house some 200 additional women. The \$90,000 radio studio building was completed. Some \$40,000 was received in gifts and grants, mainly for scientific research. More than half of the amount was for research in medical fields. In the nine colleges and five schools, a staff of 525 persons gave instruction. Two heads of departments were included in the ten major changes in faculty personnel above the rank of instructor.

Iowa State College. Iowa's land-grant institution at Ames during 1939 made marked progress in a number of its facilities for research and instruction in agriculture, engineering, home economics, science and veterinary medicine. The Iowa State College Agricultural Foundation was established to study the operation of family-size farms through the gift of 1,750 ac. of Iowa farm land and \$100,000. Several new buildings and structures were completed, including two dormitories for women and one for men, a veterinary medicine clinic and an addition to the Memorial Union. The college radio station WOI was provided with new studios, new transmitter and a 400 ft. antenna. An Iowa State College Press was formed to provide an imprint for technical books in the fields peculiar to the college. Work in statistics as a tool for research workers was brought to the highest state it has attained in the years of its development as a separate department. In the year ending in June 1939, resident enrolment in Iowa State college reached a new high of 7,677 students, including 2,288 women and 1,101 graduate students.

(R. W. BE.)

Iran, area 634,360 sq. mi.; pop. (est. Dec. 31, 1937) 15,000,000. Chief towns: Teheran (cap., 360,000), Tabriz (220,000), Meshed (140,000), Shiraz (120,000), Isfahan (100,000). Ruler, Reza Pahlevi Shah; language, Persian; religion, Mohammedan.

History.—On Feb. 21, 1939 diplomatic relations with France

were resumed: the break had lasted since Dec. 28, 1938 and had been caused by references in the French press to the Shah which were regarded in Iran as insulting. The marriage of the Crown Prince, H. H. Shahpur Mohammed Reza, to Princess Fawzieh, sister of King Farouk of Egypt, was celebrated on March 15 in accordance with Moslem usage at the Abdin Palace in Cairo. On September 5 the Government announced that Iran would remain neutral, and would defend her neutrality. On the Government's resignation on October 27, the Shah appointed Dr. Matin-Daftari, formerly minister of justice, to be prime minister.

Banking and Finance.—Revenue, ordinary, (est. 1938–39) 1,528,400,000 rials; (est. 1939–40) 1,930,096,000 rials; expenditure, ordinary, (est. 1938–39) 1,527,500,000 rials; (est. 1939–40) 2,613,482,000 rials; foreign loan (May 15, 1939) £991,120; public debt (Dec. 31, 1938) 98,900,000 rials; note circulation (May 31, 1939) 856,000,000 rials; gold reserve (May 22, 1939) 310,949,000 rials; exchange rate rials 80.50 = £1 sterling.

Trade and Communication.—Foreign trade (merchandise) 1937–38: imports 1,394,878,000 rials; exports 2,559,881,000 rials. Communications 1938: roads fit for wheeled traffic c. 8,700 mi.; railways open to traffic 1,072 miles.

Agriculture and Minerals.—Production, 1936–37 (metric tons): petroleum, crude (1938) 10,359,000; wheat 2,159,560; barley 882,564; rice 398,510; beetroot 135,940; cotton 122,480; wool 12,963; beet sugar (1937–38) 26,100; tobacco (1937–38) 15,900.

Iraq, area 116,000 sq. mi.; pop. (est. Dec. 31, 1938) 5,000,000. Chief towns (pop. est. 1938): Baghdad (capital 400,000); Mosul (260,000); Basrah (180,000). Ruler: King Feisal II; regent: Prince Abdul Ilah; premier: General Nuri-Es-Saud; language: Arabic; religion: Mohammedan.

History.—Early in January the prime minister broadcast a plea for more truly democratic government with an effective parliamentary opposition, freedom of the press, and a reformed electoral law. On March 7 Seyyid Hikmat Sulaiman, prime minister after the military coup d'état of Oct. 1936, was arrested on a charge of plotting to overthrow the Government and to place the king's uncle, the Emir Zaid, on the throne. It was not thought that the emir was privy to the plot. Martial law was enforced at the Army headquarters near Baghdad and its neighbourhood. On April 4 King Ghazi was killed in a motor accident in Baghdad, and his three-year-old son was proclaimed king as Feisal II, under the regency of his maternal uncle, the Emir Abdul Ilah. On the same day, a mob, under the impression that the British were responsible for the king's death, murdered the British consul at Mosul, G. Monck-Mason. The death sentence passed on a 17-year old student for this crime was later commuted to 15 years' imprisonment. On May 18 Seyyid Ali Jowdat el-Ayubi became foreign minister, while the prime minister himself took over the ministry of the interior. On May 31 the Iraq Petroleum Company agreed to advance the Government £3,000,000 in return for modifications in the drilling schedule imposed by the Government on the British Oil Development Company.

According to a statement broadcast by the prime minister on March 30, Iraq's foreign policy was based first on alliance with Great Britain, and secondly on alliance with neighbouring Arab States and friendship with Iran and Turkey. In fulfilment of this policy, on September 6, diplomatic relations with Germany were severed, and all Germans were deported from Iraq. (E. A. ASH.)

Education.—In 1938: elementary schools, Government, 741; scholars, 94,368; new schools opened 1938–39, 22; secondary schools, 14; scholars, 1,904; intermediate schools, 48; scholars, 10,611.

Banking and Finance.—Revenue, ordinary (actual 1938–39),

FEISAL II, 3 years old, became king of Iraq Apr. 4, 1939, when his father, Ghazi I, was killed in a motor car accident

5,686,050 dinars; (est. 1939-40) 6,033,000 dinars; expenditure, ordinary (actual 1938-39), 5,493,265 dinars; (est. 1939-40) 5,994,632 dinars; public debt (Dec. 31, 1938), 1,000,000 dinars; notes in circulation (June 30, 1939) 4,200,000 dinars; foreign assets reserves (sterling), £4,600,000 sterling; exchange rate (currency based on sterling): 1 dinar=£1 sterling.

Trade and Communication.—Foreign trade 1938 (merchandise): imports, 9,361,004 dinars; exports, domestic, 3,472,369 dinars; foreign produce, 216,466 dinars. Communications 1939: roads, main routes, 3,130mi.; railways, open to traffic, 752 miles.

Agriculture and Minerals.—Production 1938 (in metric tons): petroleum, crude, 4,272,000; wheat, 600,000; rice, 360,000; barley (1937), 570,000; tobacco, 4,000; wool (1937), 7,200; cotton, 2,900. (W. H. WN.)

Ireland, Northern. Area 5,238 sq.mi.; pop. (June 30, 1938) 1,285,000. Chief towns (pop. census 1937) Belfast (438,086); Londonderry (47,813). Governor: the Duke of Abercorn; language: English; religion: Christian (Roman Catholic, 33.75%; Presbyterian, 31.4%; Episcopalian, 27%).

History.—The earlier part of the year 1939 was marked by continued resistance to Eire's partition-ending propaganda, and in March Ulster's expressed "unalterable determination to maintain Northern Ireland's allegiance to the Crown as an integral part of the United Kingdom" was answered by Sir Samuel Hoare's reiterated assurance of no coercion into an "all-Ireland union." In the same month the Government opened a London office at 21 Cockspur street, passenger railway fares were advanced by 5%, and it was announced that £100,000 extra had been allotted for combatting I. R. A. (Irish Republican Army) outrages. The budget of May recorded a loss of over £3,000,000 in connection with the new road-transport schemes and imposed increased motor taxation, but by October war had made an emergency budget necessary. This doubled Ulster's original contribution of £1,000,000 to Imperial Services to £2,000,000 during the first months of the war, and by additional taxation increased the reserved revenue

by £1,240,000 over the previous budget estimate. By taking similar economic measures to those taken in Great Britain (e. g., the raising of estate duties) it was ensured that excess war expenditure should fall on the Imperial, and not on the Northern Ireland exchequer.

Ulster's anxiety to play her part in any difficulty in which the Empire might find itself was clearly shown at the end of April, when Lord Craigavon informed the British Government that she "as the most loyal part of the United Kingdom would deeply resent omission from the Military Training Bill"; but Mr. Chamberlain in the House of Commons (May 4), while warmly welcoming this attitude, decided that it would not be politic to extend the bill to Northern Ireland.

Unemployment showed a marked decline during 1939, the figures at the half-year being the lowest for 19 months. (L. H. D.)

Education.—In 1938: elementary schools 1,700; scholars 191,862; secondary schools 76; scholars 14,557; universities, students 1,590.

Banking and Finance.—Revenue (1938-39) £16,295,306; expenditure (1938-39) £15,245,853.

Trade and Communication.—External trade 1938: imports, £54,385,000; exports, £51,061,000. Communications 1938: roads fit for motor traffic, 13,008mi.; railways, standard gauge 633mi.; narrow 121.

Agriculture and Manufactures.—Production 1938: in tons, potatoes 491,000; oats 22,700; wheat 3,850; flax (1937) 4,187; barley 1,025; cattle 731,930 head; sheep 893,431 head; pigs 810,312 head; poultry, number 10,193,038; shipbuilding, tonnage launched 79,468; value of linen goods exported 1938, £5,480,000.

Irish Free State: see EIRE.

Iron and Steel. Discussion of the iron and steel industry can for the most part be handled more satisfactorily subdivided into its three main headings—iron ore, pig iron, and steel. Production tables under each of these headings include all countries in which production of the commodity in question has exceeded 1,000,000 tons. This coverage in general accounts for 93-98% of the totals.

Iron Ore.—World production of iron ore decreased 64% from the 1929 high to the 1932 low, and recovered to 107% of the 1929

level in 1937. Three countries, the United States, France, and the Soviet Union, contribute nearly two-thirds of the total, while the other two of the leading iron and steel producers, the United Kingdom and Germany, add another 10%. Production declined sharply in 1938, mostly in the United States, but regained most of the loss in 1939. The United States output for 1939 rose to 51,830,000 long tons.

The industry in the United States and the Soviet Union is practically self-contained, but Germany produces only about one-third of her requirements, and imports two-thirds, while the United Kingdom produces about two-thirds and imports one-third. Sweden exports almost her entire output, mainly to Germany, and about one-half of the French output is exported to Belgium and Germany.

Pig Iron.—World production of pig iron increased by 25% in 1939, to 102,400,000 metric tons, all of the major countries showing improvement over 1938. Part of the increase listed for Germany was due to the annexation of Czecho-Slovakia and Poland. The outputs of Germany, Japan and Italy in 1938 were new high records as was also the world total, by a small margin.

In all, exports and imports of pig iron are so small as to involve only comparatively small percentages of the output, but in some cases, considerable amounts of scrap metal are imported, to take the place of pig iron in the production of steel.

Steel.—World steel production in 1939 rose by 24%, a slightly lower figure than with pig iron, to a total of 133,200,000 tons; there were no material decreases in output. Contrary to expectation the Soviet Union failed to make a gain, but all other major producers and most of the minors did so.

The United States steel industry is practically independent of imports, and exports amount to only about 7% of the production. Among the European producers international trade plays a much larger part in the industry, except for the Soviet Union, in which exports are small, and imports run about 4%. The United Kingdom has steel imports of about 12% and exports of 19% of production, leaving a net export of 7%. Germany imports 3% and exports 19%, or a net export of 16%. France imports 2% and exports 33%, making a net export of 31%. The Economic Union of Belgium and Luxemburg are still heavier exporters, sending out 44% of the combined output. Incidentally, these European percentages, though still fairly large, have been decreased by about one-half during the past decade by export and import restrictions and embargos that have been put into effect in these and other countries to which exports were formerly made.

Europe.—The trend of events during 1938 and 1939 has made some marked changes in the steel industry of Europe. First the Austrian *anschluss* brought to Germany a steel output of about

640,000 tons; another 350,000 tons was acquired with the Sudetenland, while another 750,000 tons of the Czech output went to Poland. Then the absorption of Bohemia and Moravia brought the remaining 1,200,000 tons of Czech output to Germany, and finally the conquest of Poland added the former Polish output of 1,500,000 tons, plus the plants Poland had taken over from the Czechs. All told, the German industry has, at the expense of these countries, been expanded by about 4,500,000 tons, or nearly a quarter of the 1937 German capacity. On the surface, this would seem a rather comfortable addition, but actually it is far from being an unmixed blessing, since these areas produce little more than half of their ore requirements, so that the net result is not simply an increase of 25% in steel output, but an increase of about 10% in an already large ore deficit. As a result of these additions, as well as enlargement of home plants, the maximum German productive capacity is reported to be 23,000,000 tons of pig iron and 29,000,000 tons of steel.

Ore production in Germany increased 13% from Jan. to June 1939, while ore imports jumped 41%. Pig iron and steel outputs rose less than 10% from January to July, from which one is led to infer that the bulk of the increase in the year's totals, 10% for pig

THE MILLS of Republic Steel Company at Cleveland, like those of all major U.S. steel producers, began operating on night schedules about Sept. 8, 1939, to fill the rush of war orders

World Production of Pig Iron

STEEL INGOT PRODUCTION in the United States: percentage of capacity

iron and 6% for steel, came from acquisition of new producing areas rather than from actual increase of home output. The latest survey gives the United Kingdom a maximum steel productive capacity of 14,700,000 long tons, an increase of 6.5% during 1939. Iron ore production in France in June 1939 was 16% above that of January, while pig iron output was 26% higher, and steel output 29% higher; monthly figures for the last half of the year are not available, but output evidently continued to rise, as the total for the second half exceeded that for the first half of the year by 4% for pig iron and 6% for steel. Eight new electric steel furnaces were installed during the year. The war is said to have caused shortages of ore and coke in Belgium, but nevertheless the October output of pig iron was 11% greater than in January, while steel was 24% higher, and the year's total showed an increase of 20% for pig iron and 27% for steel, over those for 1938.

China.—Changes in the map of the industry, resulting from war, have not been confined to Europe. In China, two 100-ton and two 250-ton blast-furnaces and two 30-ton open-hearth furnaces have been removed from the Hanyang Iron Works to a point in the interior. Other new construction includes 8,000 tons annually of crucible steel and 10,000 tons of soft steel. (See also FLUORSFAR; METALLURGY.) (G. A. Ro.)

Ironside, Sir (William) Edmund (1880—), British soldier, was born May 6, son of a surgeon-major of Ironside, Aberdeenshire. He entered the Royal Artillery in 1899 and went to South Africa, where he saw active service in the Boer War. At the outbreak of the World War he was a general staff officer, third grade. By 1918 he had advanced to brigadier-general in command of the 99th Infantry brigade in France, and shortly before the armistice he was transferred to Archangel as commander-in-chief of the Allied troops there. Thereafter he commanded various forces overseas, and was promoted general in 1935. He was appointed aide-de-camp general to the King in 1937, was commander-in-chief of the Eastern command (1936–38) and commander-in-chief of British forces in the Middle East. In Oct. 1938 he was appointed governor and commander-in-chief of Gibraltar. On May 31, 1939, he was named British inspector-general of overseas forces. The day after the Franco-British declaration of war against Germany he began staff conferences in Paris with Gen. Maurice Gustave Gamelin.

Irrigation. As a result of the water supply forecasting program initiated by the Federal Government in 1935, it is now possible to gauge in advance the amounts seasonally available for irrigation, so permitting some assurance in the planting and harvesting of early or late maturing crops dependent upon such supplies. These forecasts are released periodically from December to April. They refer to future water supply either as accumulated snow in the higher altitudes, or water in surface or underground reservoirs in the lower regions. The closing forecast

for the 1939 irrigation water supply indicated a below-average supply throughout the 11 Far Western States. With a few exceptions where storage was carried over from 1938, these expected conditions prevailed. The series of dry years extending back to 1926, has forced a vast expansion of storage facilities, both surface and underground. It is estimated that the cost of irrigation reclamation in the West has totalled about \$1,500,000,000, more than half of which was financed by private interests. Recently, however, the program has been almost entirely under Federal supervision with funds made available by Congress and allocated to several agencies involved in irrigation agriculture. In Federal reclamation projects alone, water storage during the past six years has increased more than five-fold. Since 1933, when 46 reclamation reservoirs held 7,000,000 ac.-ft. of water, storage capacity has risen to more than 35,000,000 acre-feet. This great increase is largely due to the completion of 24 new reservoirs including Lake Mead on the Boulder Canyon project, which now holds back nearly 25,000,000 ac.-ft. of water. (See also DROUGHT.)

In Idaho, at the Minidoka irrigation development, three reservoirs can hold 2,300,000 ac.-ft.; in the two reservoirs of the Rio Grande development in New Mexico-Texas 1,150,000 ac.-ft. may be stored, and in the State of Washington at the Yakima development, five reservoirs can hold 1,000,000 acre-feet.

Construction work was completed by the Federal Bureau of Reclamation on eight dams during 1939, including the Bartlett dam on the Verde river in Arizona, the world's highest multiple-arch dam. The construction program of the Bureau has been accelerated with appropriations from the Reclamation fund, the General funds of the Treasury, and carry-over Public Works Administration allotments under Emergency Relief Appropriation Acts.

Among the more important projects under construction in 1939 were the Grand Coulee dam on the Columbia Basin project in the State of Washington; the Shasta and Friant dams on the Central Valley project in California; and the Green Mountain dam on the Colorado-Big Thompson project in Colorado. During its fiscal year, the bureau also built more than 250 mi. of canals, 138 mi. of drains, 32 tunnels, 70 mi. of pipe lines, 11,000 canal structures and 100 flumes. The Emergency Relief program placed several other Federal Departmental agencies in construction fields leading to irrigation, notably the Corps of Army Engineers and the Department of Agriculture through its Soil Conservation Service and the Water Facilities Administration. The Regional Salinity Laboratory, an institution of the Federal Government intended to permit study of the effect on crops of various concentrations of salt in irrigation water, was completed in 1939. It is at Riverside, Calif. (See also DAMS.)

BIBLIOGRAPHY.—Fred C. Scobey, "Flow of Water in Irrigation and Similar Canals," U.S. Govt. Printing Office Tech. Bul. 652; Wells A. Hutchins, "Sewage Irrigation as Practiced in the Western States," U.S. Govt. Printing Office Tech. Bul. 675; Henry M. Eakin, "Silt of Reservoirs," revised by Carl B. Brown, U.S. Govt. Printing Office, Tech. Bul. 524.

Italy.—During 1939 irrigation projects were being carried out in various regions of Italy. In Sicily the integral reclamation of the Latifondi covering 1,250,000 ac., include the building of reservoirs, aqueducts, the sinking of artesian wells and the provision of other necessities to ensure against seasonal droughts. This is a 2,000,000,000 lire project. The amount to be spent on irrigation is estimated at about 400,000,000 lire. Similar projects are being carried out in Apulian Table, the Tuscan Maremma, on the plains of Salerno and in Albania and Ethiopia.

The Netherlands.—Work on the second polder has been proceeding. A short time ago the dike between Lemmer, on the Friesland coast, and the Island of Urk, in the Ysel-lake, was completed. This dike extends for about 15 miles. It is to be expected that the dike between Urk and the Overijl coast will be completed in 1940.

China.—In July 1938, despite the fact that war had been raging for a year, the Ministry of Economics was able to report the completion of two large irrigation projects in the Northwest. One of these is the Mei Huei canal in Shensi, which irrigates 200,000 mow and increases annual production to the value of \$1,000,000. The other is the Tao Huei canal in Kansu, which irrigates 35,000 mow and increases the agricultural yield by \$200,000 annually. There are also several other such projects in the process of construction. In Shensi, there are the Lo Huei canal, irrigating 500,000 mow, the Ho Huei canal irrigating 100,000 mow, and the Yen Huei canal irrigating 470,000 mow. In Kansu, there is the Huang Huei canal, irrigating 30,000 mow. In the south-west, plans are in progress for the irrigation of a total of 200,000 mow in Szechwan, 10,000 mow in Kweichow, 190,000 mow in Kwangsi. Along the Yunnan-Indo-China railroad near Kaiyuan and Mengtze, good irrigation works can reclaim about 200,000 mow for cultivation. The successful completion of these projects should contribute more to the solution of the grain problem than any other single technical improvement.

Russia.—New irrigation systems are being constructed in Central Asia, Kazakhstan, Siberia, the Caucasus and in the region of the Volga river. More than 30 canals are now being built which will irrigate 1,235,483 ac. of collective farm fields.

The first unit of the big irrigation project on the Chu river has been completed. This provides 74,128 ac. of land in Kazakhstan and Kirghizia with irrigation. New cotton fields have been planted in the valley of the Chu river.

The first unit of the construction of the Allay irrigation system in the Altai district has been completed. This is the first big irrigation project in Western Siberia. The water will flow from the Allay river along the canals whose length is 20 mi. and will irrigate 27,156 ac. of nearby fields, most of which are sown to sugar beets. The first large system of machine irrigation has been constructed on the Irgiz river in the Saratov district, where a huge floating pump station has been completed which will provide water to the surrounding fields.

A new canal is being completed in the fertile valley of Arkhan-Churt in the Caucasus. With the construction of the main canal in 1940 which will be supplied with water from the Terek river, 14,826 ac. will be irrigated.

The first Ordjonikidze Milsky canal has been completed. Supplied with water from the Araks river, it will irrigate more than 74,128 ac. of land of the Milsk-Kharahakh valley. An outstanding irrigation project will soon be completed in the Armenian S.S.R. The first unit which has been built will provide water for 69,186 acres. This system is fed from Lake Sevan and the Zanga river.

Construction of the Shakhroud irrigation system in Uzbekistan and the Tash-Keprin reservoir in the Turkmen S.S.R. neared completion. The reservoir will contain approximately 134,000 ac.-ft. of water which will be used for irrigation of cotton fields.

Mexico.—The activities of the Mexican Government in regard to irrigation during 1939 have comprised: (a) Large projects destined to give irrigation service to vast sections of the country; (b) Small projects suitably distributed in the different States of the republic, to benefit small groups of peasants.

Among the large irrigation works are El Palmito dam, which is being constructed in the State of Durango, on the Nazas river, and which, when completed, will make possible better utilization of the water of that stream for irrigation and development of water power. This earth dam has a maximum height of 92 m. and will impound 3,000,000,000 cu.m. of water. El Azúcar dam, also of earth and having a maximum height of 43 m., on the San Juan river, a tributary of the Bravo river, in the State of Tamalulipas, will form a reservoir having a capacity of 2,100,000,000 cubic metres. The purpose of this project is to make use of the waters of this stream in the irrigation of 60,000 hectares, and also to control its violent flood waters and prevent the disastrous inundations which sometimes occur. La Angostura dam, of concrete arch type, with a maximum height of 88 m., constitutes one of the first stages in the construction of the works required for the utilization of the waters of the Yaqui river in the State of Sonora for irrigation and power development. It is constructed on the Bavispe river and will impound 1,270,000,000 cu.m. of water.

Beside these three dams, other important works are being constructed in different sections of the country. These include the Solis dam on the Lerma river, Guanajuato; a diversion and canal in Cutzamala, Guerrero; a dam and canals in Huichapan, Hidalgo; the Ixmiquilpan canal; a dam and canals in Morelia and Queréndaro, Michoacan; a diversion and canals and canals in Morelia and Queréndaro, Michoacan; a diversion and canals in Tarecuate, Michoacan; a diversion and canal in Tehuantepec, Oaxaca; the S. Ildefonso dam, Queretaro; Obregon dam in S. Luis Potosi; the Tesla canal, Sonora; several canals in Yaqui Valley, Sonora; and a diversion dam and canals in Sta. Rosa, Zacatecas.

A 134-MILE ADDITION to the All-American canal in California—the Coachella branch—was begun in 1939. The giant shovels used in digging the canal lift 32 tons of sand in one loading

Activities are being continued in the following large irrigation districts with works previously constructed: D. Martín, Coahuila; Delicias, Chihuahua; S. Carlos, Coahuila; Ciudad Juárez, Chihuahua; Culiacán, Sinaloa; Lerma river, Guanajuato; Chapala, Jalisco; Colorado river, Baja California; Lagunera region, Coahuila and Durango; Colima, Colima; Los Altos, Jalisco; Magdalena and Ahualulco, Jalisco; Arroyozarco, Mexico; Tierracaliente, Michoacan; Zamora valley, Michoacan; Zacapu, Michoacan; Oaxaca valley, Oaxaca; Altar, Sonora; La Antigua, Veracruz; and districts of Yucatán.

Various small irrigation works have been studied and constructed in all of the country in order to solve local problems of small groups of farmers, placing under irrigation approximately 5,000 hectares.

The area irrigated by means of works of the National Irrigation Commission is 500,000 hectares, and on completing the different stages of the projects under construction, it will be possible to irrigate about 1,000,000 hectares. In addition, projects are being considered which will permit the irrigation of another 700,000 hectares. (A. T. M.)

Islam. Two general tendencies were in operation in the Islamic world during 1939, one towards greater unity and solidarity among the Muslim powers, the other in the direction of economic consolidation and modernization.

In pursuance of an anti-aggression Eastern pact, there was a meeting of the representatives of Turkey, Iran, Iraq, and Afghanistan in Teheran in April 1939. Protests and demonstrations were made in most Islamic countries against the virtual absorption of Albania by Italy on April 7. Italy's policy in the Tripolitaine also evoked criticism. A movement in the direction of greater friendliness or at least less hostility is noticeable in the relations of the Islamic world with the Western democracies. Egypt has had intimate treaty terms with Great Britain, but such discontent as was caused by the disapproval of British policy to the Arabs in Palestine has been relegated to the background by the new situation in the eastern Mediterranean, in which Egyptian, British and Turkish interests are identical. The visit by the French prime minister M. Daladier to French North Africa (Jan. 1939) showed that in spite of the under-current of nationalist opposition, France could rely upon the support of her Muslim subjects and allies against any disturbing factors in that region.

The late Kemal Atatürk was the originator of many of the new

ideas now infiltrating the Islamic world. Under his successor, Ismet İnönü, Turkish policy in its ultimate aims remains the same. But there is a change almost imperceptible in method and in spirit. The evils and empty forms against which Atatürk fought have been swept away, and there is more tolerance now of the slower processes of religious and social evolution. Turkey's alliance with France and Great Britain brings her out definitely from a position of neutrality to a position of responsibility in the larger issues of Europe and the world. Her acquisition of the Sanjak of Alexandretta (the Hatay) from France has however been criticized and has brought her into conflict with Arab opinion.

Economic consolidation is being pushed with vigour in all independent Islamic countries. Turkey's new Four Year plan started in 1939 with a credit of £10,000,000 from Great Britain. She is also pushing on her agricultural expansion and her mineral exploitation, at the same time that she is attending to her harbours and her mercantile marine. Iraq's wealth depends upon irrigation, and her latest Habbaniya scheme will enable her to conserve some of the Euphrates water and at the same time lessen the danger from floods. Saudi Arabia opened her first oil and commercial port in May 1939 at Ras Tanaura on the Persian Gulf, and has now an oil pipe line in the coastal region of the Hasa. Road improvements are being pushed on, and the water of the sacred spring of Zemzem is being purified and sterilized. The oversea pilgrims at the Pilgrimage of 1357 H. (Jan. 1939) numbered only 52,000, compared with the peak figure of 135,000 in 1927,—a sure index of economic depression and unrest in the Islamic world. Egyptian economic development is being pushed on through the Bank of Misr, and Egyptian ships have captured 80% of the pilgrim traffic to Jiddah. Communications are being improved everywhere, and a remarkable asphalted road, 600mi. in length, with major and minor bridges, is being pushed through the Arabian desert.

It will run from Haifa to Baghdad, through Palestine, Trans-Jordan and Iraq, with feeders connecting it with Damascus, Cairo, Jerusalem and Amman.

The first mosque in Canada was inaugurated at Edmonton (Alberta) by an Indian leader then in Canada, in a public ceremony attended by the mayor of Edmonton (J. W. Fry), and other notabilities. One of the principal benefactors was the late Ali Tarra-bin, a Syrian Arab merchant who originally came from Damascus.

The women's movement is making rapid progress. Teheran was the scene of brilliant public festivities in April 1939 in celebration of the marriage of the Crown Prince (Shahpur Mohammed Reza) to the Egyptian princess Fawzieh, who appeared at public receptions with the Queen Dowager Nazli of Egypt. Muslim women attended unveiled the international Inter-parliamentary Conference on Palestine in Cairo in Oct. 1938, and there is a Muslim lady in the Punjab ministry in India. Muslim women have special constituencies of their own in the electoral rolls in India, besides participating in mixed constituencies.

On the artistic side Iran and Turkey show the greatest progress. Turkey has special schools of sculpture and painting. The Government of Iran is encouraging national music (*Musiqi-i-kishwar*) and the renowned Arab singer Muhammad Abdul Wahhab has been heard on the radio from Egypt. (A. Y. A.)

Isle of Man: see BRITISH EMPIRE.

Isotopes, The Separation of. When the existence of isotopes or atomic varieties of an element with different masses was first suggested some 30 years ago, the experience of chemists supplied conclusive evidence that the chemical properties of such isotopes were identical. None of the usual methods for separating chemical substances,

such as distillation, fractional crystallization or fractional precipitations, were believed to be effective in this case because, had such been true, variations in atomic weights would have been observed. The only methods which appeared to be available at the time for the separation of such varieties of atoms depended upon the physical differences to be expected from the kinetic theory of gases, such as fractional evaporation and fractional diffusion. Early work demonstrated that the atomic weights of the elements can be changed by such fractionation methods, and this furnished a confirmation of the existence of isotopes.

The very marked differences in the chemical properties of protium and deuterium, the two isotopes of hydrogen, resulted in the complete separation of these isotopes by fractional electrolysis and today heavy hydrogen, which exists in natural hydrogen to the extent of only one part in 6,000, is an article of commerce. The method consists in the electrolysis of caustic alkali solutions. The hydrogen gas which escapes in the process contains about one-sixth to one-tenth as much deuterium as the water from which it is electrolyzed, and hence the deuterium increases in concentration in the residue. When this process is continued until only a small residue remains, this residue consists substantially of 100% deuterium oxide. Attempts have been made to apply this same method to the separation of the isotopes of other elements, but the very slight differences in the rates of discharge of the isotopes of other elements do not permit an effective separation by these methods.

Three methods for the separation of isotopes have been developed in recent years, all depending upon the multiplication of the effects of a simple process separation, by the application of counter-current methods. Thus if any process produces a difference in concentration of the isotopes and the light and heavy fractions can be made to move in opposite directions in the apparatus, high concentrations of the two constituents will be built up at the opposite ends. In this way the effect of small differences can be increased greatly.

The first of such methods to be developed was a cascade diffusion method in which gases were allowed to diffuse through porous tubes, the lighter isotope diffusing more rapidly than the heavier. The residue from such a diffusion process was pumped to a preceding diffusing unit of the cascade and the lighter fraction was transferred to a subsequent unit in the cascade. Each diffusing unit changes the ratio of the isotopes in the gas by approximately the square root of the ratio of the masses, e.g. by about 5% in the case of neon. If a cascade of n units is arranged in this way the overall fractionation to be expected is $(1.05)^n$; thus, if some 50 units are used in such a cascade the very appreciable fractionation by a factor of 10 can be secured. In this way nearly pure samples of the neon isotopes have been produced, and some work has been done on the carbon, nitrogen and oxygen isotopes. This method is able to produce a few cubic centimetres of Ne^{22} gas in twenty-four hours from natural neon containing 10% of Ne^{22} and 90% of Ne^{20} .

The thermal diffusion method was developed in 1939. If two sides of a vessel containing a gas are maintained at different temperatures a partial separation of the isotopes of the gas will be effected. The lighter isotopes will concentrate in the warmer side of the vessel and the heavier isotopes in the colder side. Rather small effects can be secured in this way, as has been well known for a number of years. However, if two parallel surfaces are mounted in a vertical direction, as, for example, by arranging two concentric tubes in a vertical position, and a sample of gas is placed between them, the one surface being maintained at a higher temperature than the other, a separation of the isotopes will occur. Convection currents will be set up by the difference in temperature and a stream of gas moving downward

will contain an increased concentration of the heavy isotope, while a stream moving upward will contain an increased concentration of the lighter isotope. This process will produce different concentrations at the two ends of the tube, and this will continue until the effects of back diffusion prevent further changes in concentration. Very large separations of isotopes can be secured by this simple method, and practically the complete separation of the isotopes of chlorine has been effected in this way. In fact, a sample of chlorine with an atomic weight less than 35 and another of atomic weight of nearly 37 have been secured. The method is now being applied to the separation of the isotopes of many elements which can be secured in the form of gaseous compounds. It appears that its rate of production is about the same as that of the diffusion method described above, but the apparatus required is far simpler.

A third method for the separation of certain isotopes makes use of slight differences in the chemical properties of isotopes. A slight difference in the relative abundance of isotopes may exist when two phases containing the element are brought to equilibrium. Thus water vapour contains less of the heavy oxygen isotopes than liquid water with which it is in contact, ammonia gas contains less N^{15} than does a solution of ammonium salt with which it is in equilibrium, and hydrogen cyanide gas contains more of the heavy carbon isotope C^{13} than does a sodium cyanide solution in equilibrium with it. In order to effect a separation making use of these differences it is only necessary to arrange a counter-current scrubbing system, the liquid flowing downward and the gas flowing upward. Such apparatus is commonly used in chemical processes in the form of fractionation columns. Fractionation columns are of different forms, but all consist of an apparatus designed to bring the liquid flowing downward through the column into intimate contact with the gas flowing upward. Those used for the isotope separation work so far consist of glass tubes from $\frac{3}{8}$ " to 3" in diameter, filled with glass spirals designed to expose a very large surface of the liquid flowing downward to the gas flowing upward. The operation proceeds in the case of the nitrogen by pumping an ammonium nitrate solution into the top of such a column and at the bottom adding sodium hydroxide, boiling the ammonia from the solution, allowing the ammonia gas to flow backward up through the column and absorbing it in water flowing to waste at the top. After some time of continuous operation the concentration of N^{15} increases at the bottom. By using apparatus of this type nitrogen has been produced containing 72% N^{15} , and at the rate of about one gram of nitrogen of this concentration per 24 hours.

In the case of carbon the concentration is effected by the use of sodium cyanide solutions flowing downward through the columns and hydrogen cyanide gas flowing upward. In this case the C^{13} concentrates preferentially in the gas phase so that hydrogen cyanide gas is fed to the apparatus at the bottom, and sodium hydroxide solution introduced at the top, which reacts to give sodium cyanide solution which flows down the column and is discarded at the bottom. In this way 20% to 25% C^{13} has been produced instead of the natural abundance of 1.06%. The rate of production in this case is about half a gram of carbon of this composition per 24 hours. There appears to be no reason why production of both heavy nitrogen and heavy carbon cannot be increased very considerably over the figures so far obtained by these methods.

Experiments using such exchange reactions have been made in the case of sulphur as well, and some increased concentration has been secured, using sodium hydrogen sulphite solutions and sulphur dioxide gas.

It is, of course, not necessary to use liquid and gas phases only in this type of experiment. Two immiscible liquid phases could also be used travelling in opposite directions in such apparatus.

This has been used to effect a considerable concentration of the lithium isotopes by using a solution of lithium salt in alcohol solution for one liquid phase and a solution of metallic lithium in mercury as the other. Also, a solid liquid equilibrium has been used to secure some concentration of the lithium and potassium isotopes. In this case a water solution of an alkali metal salt has been allowed to flow through a zeolite of another alkali metal. The first alkali metal replaces the second from the zeolite, but the isotopes of the second alkali metal are not displaced in proportion to their concentrations from the zeolite, and hence one isotope trails behind the other in the washing out process.

The separation of the isotopes of the elements has been the most difficult problem of separation which chemists and physicists have undertaken. It cannot be expected that the separated isotopes will have commercial importance in themselves, for since their properties are so nearly the same only rarely can it be expected that the slight differences would be sufficient to make the use of a separated isotope preferable to that of the natural element. However, from the standpoint of scientific research there are many experiments which can be attacked once sufficient amounts of the isotopes are available. Thus, wherever it is desirable to follow the course of an element through a very complicated chemical system, such isotopes can be used as tracers. One of the most complicated and most interesting of such systems is presented by living organisms, and it is to be expected that new and very important information can be secured by their application in biological fields. (See also MATTER, STRUCTURE OF; PHYSICS).

Italian Colonial Empire. The table on p. 378 gives essential material relative to Italy and the colonial and mandated territories administered by her. Total area 1,486,914 sq.mi.; total population (est. Dec. 31, 1937) 58,099,000.

History.—The tension between Italy and France following the former's denouncement in Dec. 1938 of the Franco-Italian Agreement relating to Tunis (1935), continued in the early part of 1939, and there were persistent rumours of the massing of troops in the Italian African colonies adjacent to the French possessions. In Libya an order prohibited listening to the Tunis broadcasting station. A number of arrests for espionage were made.

The situation had eased slightly by March when Count Ciano informed the British Chargé d'Affaires that the troop movements in Libya were "purely defensive." On April 9, Field Marshal Goering visited Tripoli and was received by the governor, Marshal Balbo. The following month General von Brauchitsch paid a similar visit. An attempt to improve economic relations with Egypt was made in May when Marshal Balbo visited King Farouk and the Premier.

In introducing the budget for Ethiopia, the under-secretary for Italian Africa announced on May 10 that Italy controlled the whole country materially and morally. There were small groups of hostile natives operating in Shoa and Amhara, but the mass of natives was content under Italian rule. At present, owing to the immense number of natives employed on roads and other public works, no normal economy was, however, possible in the country.

As part of the public works already completed, a road across the Danakil desert from Assab to Dessye was officially opened on September 22. It is linked with the road to Addis Ababa and is described as the backbone of communication in the new Empire, since it provides the shortest route (540mi.) from the capital to

the Red sea. Other public works include the building of new European towns, and extensive port developments at Assab, Kismayo and Mogadishu. Three oceanic roads are either under construction or planned to link Addis Ababa with Mogadishu on the Indian ocean. "the free sea which lies beyond Suez and Aden."

On October 31, General Teruzzi was appointed minister for Italian Africa, a post previously held by the Duce. It was announced early in Jan. 1940 that a number of Italians formerly domiciled in France were to be sent as colonists to Italian Africa.

Italian East Africa: see ITALIAN COLONIAL EMPIRE.

Italian Literature. The beginning of the literary year was marked by the "Aryanization" of publishing houses and the "book reclamation," both ordered by the Government. As a result of this campaign, several firms changed management or name and as a first step 900 books by some 200 Italian and foreign authors were "withdrawn from circulation as harmful in view of the historical, idealistic, and moral values established by Fascism." To protect the sale of Italian books, the Government discouraged Italian translations of foreign books and forbade their display in bookshops.

Judging from the year's gross literary output, it would appear that the Italians are dwelling especially upon the great authors of the past. The works of Machiavelli (Barion, Rizzoli), Vasari (Mondadori), G. Vigo (Laterza), Gioberti (Bocca), to mention but a few, are appearing in new and attractive critical editions. Many reprints have also been made of works by 20th century writers ranging from Serao to Panzini, who died in April.

One of the most valuable results of this quest for the past is the appearance of an unusual quantity of letters and diaries—mostly inedita. Notable are the *Epistolario Completo di Santa Caterina da Siena* (Marzocco), Guicciardini's *Carteggi* (Zanichelli), *Lettere inedite di U. Foscolo a Marzia Mortinengo* (Le Monnier), Tommaseo's *Cronichetta del Sessantosei* (Einaudi), Ricasoli's *Carteggi* (Zanichelli), Cavour's *Discorsi Parlamentari* (Nuova Italia), and the *Diario e lettere inedite* of E. Thovez (Garzanti).

Three outstanding contributions enriched the history of literary criticism: *Volume XVI* of the *Studi Danteschi* series (Sansoni); V. Cian's *Lo Sotira dal Medioevo al Pontano* (Vallardi), and G. Previtera's *La Poesia giocosa e l'umorismo delle origini al rinascimento* (Vallardi). Of considerable importance to students

of contemporary literature is Bontempelli's *Avventura Novecentista* (Vallecchi), a literary diary relating the author's struggle for a universal literature. The first volume of S. D'Amico's *Storia del Teatro Drammatico* (Rizzoli) has appeared. Franco Abbati, noted music critic, presented the first of a three-volume work, *Storia della Musica* (Garzanti). The long-awaited publication of Gaetano de Sanctis' *Storia dei Greci dalle origini al secolo V* (Nuova Italia) adds to the field of historiography the results of long years of painstaking research. A serene evaluation of the policy of Pius XI is given by L. Salvatorelli in his *Pio XI e la sua eredità spirituale* (Einaudi). Three sound works on American culture and architecture have also been published: A. La Piana's *La Cultura Americana e l'Italia* (Einaudi); P. Carbonara's *L'Architettura in America* (Laterza), and E. and G. Cecchi's *Emily Dickinson* (Marcelliana).

The field of fiction still seems divided pretty clearly into three main groups: the first, to which belong such writers of the old guard as Samminiatielli, Chiesa and Soffici, continue to weave their past into autobiographical works; the second endeavour to instil love for bucolic as against city life; a third and large group of young writers find inspiration in the "historical, idealistic, and moral values established by Fascism." Four writers who do not fall into the above classification, have enjoyed exceptional success: R. Bacchelli, with *La miseria viene in borco* (Barzanti), a continuation of the historical cycle begun with *Il Molino sul Po*; A. de Céspedes, with *Nessuno torna indietro* (Mondadori) the story of eight convent-bred girls, now in its tenth printing; P. Margellini, with *Città di Pittori* (Vallecchi), fictionalized art criticism; and T. Landolfi, with *La Pietra Lunare* (Vallecchi), a weird and fantastic novel.

Noteworthy in the field of poetry are the posthumous lyrics of A. S. Novaro *Tempietto* (Mondadori); E. Montale's second volume *Le Occasioni* (Einaudi), and *Poesie* (Parenti) of the very promising S. Penna. N. Moscardelli's *Le più belle poesie dell'anno 1939* (Marcelliana) again proves valuable.

Among the prominent works by Italian writers living outside of Italy, are: G. Garretto's *Sicile, Terre de Douleur* (Corrêa); Lussu's *Sardinian Brigade* (Knopf); L. Venturi's *Peintres Modernes* (Albin Michel); Salvemini's *Historian and Scientist* (Harvard), and Sturzo's *Church and State* (Geoffrey Bles).

Italy. Excluding Libya: area 119,740 sq.mi.; pop. (est. Aug. 31, 1938) 43,818,000. Chief towns (pop. 1936): Rome (1,148,948), Milan (1,103,960), Naples (860,176), Genoa (625,355), Turin (623,454). Ruler, King Victor Emmanuel III; language, Italian; religion, Christian (Roman Catholic).

History.—Foreign Affairs.—The most important events in Italian foreign affairs during the year 1939 were: the press campaign for Mediterranean claims during Daladier's visit to Corsica and North Africa (January 2); the visit of Chamberlain and Halifax to Rome (January 11); Ciano's visit to Stoyadinovic (January 20); the fall of Barcelona (January 26) and the extension of the appeasement policy to Spain; Daladier's speech crystallizing the Mediterranean claims (March 1); King Victor Emmanuel's speech (March 23); Mussolini's answer to Daladier (March 30); the annexation of Albania (April 7); Mussolini's visit to the French border and his declarations of foreign policy (May 14 and 19); the military alliance with Germany (May 22); the recall of Ambassador Grandi from London (July 12); the European war and Italy's non-belligerency; Ciano's declarations on foreign policy (December 16); the visit of King Victor Emmanuel to the Vatican (Dec. 21), and of Pope Pius to the Quirinal (Dec. 28).

The year began with the continuation of the campaign for territorial settlements in North Africa. The struggle for Corsica, Tunisia, and Jibuti resulted in Daladier's trip to the danger zones: Corsica, Tunisia and Algiers. The Italian press ridiculed the trip, playing up the small incidents and ignoring its fundamental success, but the visit showed clearly that Italy in her struggle with France was not to meet with appeasement and could not expect victories as easy as Germany's over the Central European countries. The Fascists hoped that a favourable agreement with Chamberlain would bring British pressure to bear upon the French Government in order to effect a Mediterranean Munich.

On January 26, Barcelona fell and Mussolini had won his most difficult international struggle. The bloodiest battle yet to arise between the democracies and the totalitarian governments was resolved in his favour. As soon as the policy of appeasement was extended to Spain, Franco became the object of much diplomatic courting and both his and Mussolini's positions in the Mediterranean were strengthened. (See also SPAIN, CIVIL WAR IN.)

Italy's Balkan policy pursued its usual course, Yugoslavia, won away from France, was the object of increasingly persuasive overtures of friendship. Count Ciano visited Premier Stoyadinovic on January 20 with the result that the Entente Powers seemed forever excluded from Yugoslavia, which they had created and armed.

Italy clarified and solidified her position in the Balkans, even though it meant giving up her claims on Dalmatia, one of the leit-motifs of Fascism, and Belgrade abandoned the Slavic minorities in Italy to their own fate.

The press centred its action against France and was answered by the French press in a caustic manner. On March 1, Daladier declared again that France would not yield either a single man or an inch of ground, and that the Mussolini-Laval agreement of Jan. 1935 (denounced by Italy on Dec. 27, 1938) was still the limit of France's offers. On March 23, the King, speaking in the new Chamber of Guilds, formally affirmed the legitimacy of the Italian claims on France, and at the same time flouted any rumours of a rift between Mussolini and the royal house. A formal Italian ultimatum was expected by March 30. The Axis again had worked in favour of Germany in the Bohemian coup (March 16) and the occupation of what was left of Czecho-Slovakia seemed to have proved that the appeasement front was disposed to go to the limit. But instead, Mussolini answered Daladier in Cosenza with a speech which was vehement but vague. While thundering against the French attitude he indicated that Italy was in no hurry.

Drastic action came in the Balkans. News of disorders in Albania and of disagreements between King Zog and the Italian Government had been spread by Fascist propaganda. Rumours of impending Italian occupation of Albania were heard throughout Europe. The annexation of Albania, altering the status quo of the Mediterranean, was contrary to the Anglo-Italian agreement, but Chamberlain, still pursuing his appeasement policy, declared (April 7) that Great Britain had no objections to the annexation. That same day the Italians landed in Albania and, encountering practically no resistance, marched on Tirana. The crown of Albania was offered by a puppet Albanian Cabinet to King Victor Emmanuel who assumed the title of King of Italy and Albania. (See also ALBANIA.)

The Greek and Yugoslavian Governments viewed the Albanian coup with great anxiety. Italy, though actually in control of Albania since 1927, now took over the country directly, placing herself in a position to put direct pressure on Greece and to fight Yugoslavia on two fronts. Indeed the first public works started in Albania by the Italian Government proved to be military highways. On May 11, Prince Paul, Regent of Yugoslavia, visited Rome, thus giving his seal of approval to Italy's position in the Balkans.

The following week Mussolini visited Piedmont, *i.e.*, the French border. At the close of his visit on May 19, in giving the Cuneo address, he made two interesting pronouncements: one was that there were no problems in Europe that could not be resolved peacefully, and the other was that he would not speak in public again for a long while. It was his last bid for appeasement. On May 22, Count Ciano and Herr von Ribbentrop signed a military alliance so binding that it was called the Steel Pact, thus consecrating the success of the Axis policy in Czecho-Slovakia, Memel, and Albania.

During the month of June the problem of Danzig took on new proportions, putting the appeasement policy to a new test. The Fascists supported German claims and urged the Polish Government to yield before it was too late. It was obvious that what Mussolini wanted was another Munich with Italy getting the spoils. The Munich slogan of "peace with justice" was revamped again. Il Duce resorted to every means to soften the firmness of the French and British Governments. On July 12 Count Dino Grandi, ambassador to St. James's, was recalled and made minister of Justice. The manner of his withdrawal indicated the extent of displeasure felt by Palazzo Chigi at the British attitude.

The Italian-German alliance was solidified in the eyes of the world by the mass repatriation of the Germans living in Southern

ITALY: Industrial production Index (The Annalist)

Tyrol under Italian rule (beginning July 5). Thus Italy and Germany tried to iron out their only difference and at the same time emphasize their desire for peace. Incidental to this mass migration was untold suffering, hardship, and anguish on the part of the population involved.

With the sharpening of the Danzig question the Axis policy underwent some revision. As the war clouds darkened, Mussolini saw himself involved in a struggle which did not directly concern him, and in which he might risk everything solely to secure Danzig for the Reich. As an alternative he, and after him the Italian press, pushed the idea of an international conference. Moreover the August army manoeuvres revealed that the Italian Army was in no condition to engage in a war. In an effort to avoid an untimely general conflagration Ciano went personally to see Herr von Ribbentrop and Herr Hitler (the Salzburg and Berghoff conversations, August 14). Though the communiqués declared that the Axis powers were "100% in agreement," there has been a great deal of speculation as to the real meaning of the conversations.

That the Russian-German pact took Italy by surprise has been admitted by Foreign Minister Ciano. It destroyed the anti-Comintern Front and thus changed the position of Italy. When the war finally did break out, Italy did not declare her neutrality but declared instead that the Axis still obtained, but without military activity on the Italian front. Once more Mussolini launched an appeal for peace, backed by the Catholic Church and by most of the neutral powers. But his efforts failed.

On September 19, Giuseppe Bastianini, under-secretary for Foreign Affairs, was appointed Ambassador to London. It seemed obvious that Italy wanted to make the most of her position, and, while declaring fidelity to the Axis, she was willing to flirt with the democracies. The French and British Governments did not choose to consider Fascism (*q. v.*) a part of the Totalitarianism which they were fighting, but instead chose to string along with Mussolini. No pressure of any kind was put on Italy, and Mussolini took advantage of his freedom to work feverishly for the *mise a point* of the military machine.

ITALIAN TROOPS landing at the harbour in Durazzo during the invasion of Albania, April 7-9, 1939

The Russian activity in the Baltic and the partition of Poland revealed that Russia's friendship meant as much, if not more, to Germany than did Italy's. After a month of wavering, the Italian press resumed its attacks on Bolshevism and supplied invaded Finland with air forces. But still the hopes of Mussolini, supported by the Pope, were pinned on a "peace with justice."

According to Ciano the Axis policy was thwarted by Chamberlain's overtures to the Soviets which in turn caused Hitler to sign the non-aggression pact. The Rome-Berlin Axis, in spite of Il Duce's friendship for der Fuehrer, was not to be extended to Moscow. As the year drew to a close, a last peace offensive was started again, with the Pope and most of the neutrals backing Mussolini. The renewed friendship of the Church and Fascism was sealed by the King's visit to the Vatican and the Pope's visit to the Quirinal, an epoch-making event.

Home Affairs.—At home, Mussolini continued his programs of military strength, racial purity, and self-sufficiency (*autarchia*). The racial program was carried on vigorously and the legislation which had been started in 1938, was completed during 1939. Most of the Nuremberg laws were adopted, and the concept of racial differentiation was introduced throughout the empire. The struggle for self-sufficiency which had been begun on Oct. 10, 1938, with the creation of a *Commissione Suprema*, proceeded steadily, putting the Government in control of almost every detail of the economic life. With the outbreak of the war, Government control was extended even to consumption, and in addition to the meatless days already in effect, ration cards were issued for coffee, and several products were severely limited or forbidden entirely.

The new Chamber of Guilds (*Camera dei Fasci e delle Corporazioni*) was inaugurated on March 23. Though this change had been expected for over 10 years, the actual setting-up of the new system, whereby the deputies are chosen and not elected, made no real difference. The fact that the number of deputies increased, seemed to indicate that the new set-up provided a larger number of places for party leaders. July 1 saw the establishment of the new Civil Code, the greatest codification of the changes wrought by the Fascist regime in civil life to date.

An extensive program of land redemption was launched on July 20 with the announcement that the large estates of Sicily were to be broken up into small farms on which farm-houses were to be built. The Sicilian peasants are to be the beneficiaries of this program, which entails an expenditure of 10,000,000,000 lire in 10 years. The plan calls not only for more houses, but also for the wholesale building of water and power plants. The magnitude of the plan, and the eulogistic press campaign that advertised it, demonstrated that the breaking-up of Sicilian estates is one more chapter in the traditional Fascist policy of public works with all its positive and negative consequences.

On October 31 there occurred a sweeping "changing of the guard" in which many of the leading Fascist hierarchs, including the secretary of the party, a number of ministers, and several high officials of the army, navy and air force, were removed. The most widely-spread interpretation of this house-cleaning abroad was that Mussolini had rid himself of pro-German chiefs. Following events proved this interpretation completely inconsistent. The general-secretary of the party, Ettore Muti, is a veteran of the Ethiopian and Spanish wars.

Education.—In 1937-38: public elementary schools, 131,580, pupils, 5,411,596; private elementary schools, 4,414, pupils, 132,675; students: in secondary schools, 647,505; in universities, 77,429.

Defence.—At the outbreak of the war (September), a report estimated the Army at 900,000 men; first line aeroplanes 2,200 and total strength of planes 5,500. To the Navy was added the battleship "Impero."

Banking and Finance.—National budget: revenue, 27,468,000,000 lire; expenditure, 38,642,000,000 lire; public debt (Nov. 30, 1935), 108,636,600,000 lire; notes in circulation (Mar. 20, 1939), 17,967,000,000 lire; gold reserve and credit abroad (Dec. 31, 1938), 3,826,000,000 lire. Exchange rate (average Dec. 1939) 1 lira = \$.05046 U.S.

Trade and Communication.—Overseas trade: imports, 11,061,000,000 lire; exports, 8,007,100,000 lire. Colonies and Ethiopia: imports, 209,100,000 lire; exports, 2,448,900 lire. Communications: highways, 20,803 kilometres (Dec. 31, 1938). Railways, 23,221 kilometres; electrified, 6,678. Shipping (Dec. 31, 1938) gross tons, 3,294,897. Movement to and from foreign ports (in 1,000s of tons) 23,756; to and from Italian ports, 20,061. Airways: total length, 46,669; kilometres flown, 13,594,890; passengers, 142,604; merchandise (kg.), 560,446. Motor vehicles licensed (Dec. 31, 1938): cars, 345,090; trucks, 112,566; motorcycles, 198,220.

Agriculture, Manufactures, Mineral Production.—Production, to Dec. 31, 1938 (in 1,000s of quintals): wheat, 80,918; maize, 29,363; rice, 7,720; oats, 6,291; rye, 1,381. In tons: cocoons, 19,971; iron ore, 990,043; lead and zinc, 268,341; natural fuel, 2,355,117; raw silk, 1,982; pig iron, 864,536; copper, 2,963; lead, 44,031; mercury, 2,963; sulphur, 380,345. Japan, an Empire, capital, Tokyo; ruler, Emperor Hirohito; premier, General Nobuyuki Abe (resigned Jan. 14, 1940). A chain of islands in the western Pacific, stretching from South Sakhalin (50° of latitude) to the South Seas mandated

JAPAN: Industrial production (*The Annalist*)

islands (which lie near the equator); includes Chosen peninsula, on the mainland of Asia, and the small Kwantung leased territory, with the city of Dairen, on the Liaotung peninsula. Japan Proper consists of the four main islands of Honsbu, Hokkaido, Shikoku and Kyushu, while Chosen, Formosa, and South Sakhalin are administered as colonies. This is also true of the South Sea islands, which were granted to Japan under a mandate from the League of Nations after the World War (1914-18). The total area of the Japanese Empire is 263,359 sq.mi., of which Japan Proper accounts for 148,756 square miles. Population of the Empire (census, Oct. 1, 1935) was 97,697,555.

History.—(For the Chinese-Japanese War see that heading.) With the capital of the Chinese Nationalist Government established in Chungking, 1,000mi. inland, and with military operations by the Japanese troops reduced to a much smaller scale, compared with 1937 and 1938, the problem of Japan's relations with the foreign powers possessing Far Eastern interests became more important during 1939. As a result of the war Japan was in military control of all the main centres of foreign trade and industry in China, Shanghai, Tientsin, Hankow, Canton, Amoy.

It was inevitable that there should be conflicts of viewpoint between the Japanese military leaders, committed to the idea that Japan was to establish a "new order" in East Asia and foreigners, inclined to stand on their treaty rights. Great Britain possesses the largest investment stake of any nation in China, the estimated value of its holdings at the beginning of the Chinese-Japanese war being somewhat over 1,200,000,000 American dollars. The United States was also drawn into controversy with Japan because of its consistent stand for the principle of the "Open Door."

For somewhat different reasons Japan also became involved in sporadic border conflicts with the Soviet Union on several occasions during 1939.

General Issues between Japan and Western Powers.—The causes of friction between Japan and the Western Powers were greatly enhanced because of the existence in China of foreign settlements and concessions governed by representatives of foreign communi-

ties and guarded, in some cases, by foreign troops. The Japanese military authority, automatically established in every captured Chinese city, did not extend to these foreign enclaves on Chinese soil.

These foreign concessions, where the Chinese population greatly outnumbers the foreign, naturally became places of refuge for Chinese nationalists. In the large International Settlement of Shanghai and in the adjacent Chinese portion of the city there were scores of assassinations of Chinese "traitors," i.e. Chinese who consented to hold office in Japanese-sponsored regimes. Alleged laxity of the foreign police in controlling this terrorist activity was one Japanese grievance against the foreign concessions. Moreover, it was part of Japanese policy to introduce new currency issues and to establish a certain control of foreign trade in occupied territory. But the Japanese writ did not run in the foreign administered sections of Shanghai and Tientsin. Here, Japanese regulations could be disregarded in some cases, evaded in others. The attitude of the foreigners was that they were under no obligation to assist Japan in its war against China; indeed the British, French, and American Governments had given at least platonic support to China by associating themselves with statements that Japan had violated the Nine Power Treaty concluded at Washington in 1922 and prescribing respect for China's sovereignty and territorial integrity.

Moreover, the conduct of the war and the actions of the Japanese military authorities created a number of material grievances for nationals of Western powers with commercial and cultural interests in China. The Japanese Army took over the operation of the railways in occupied territory without paying any compensation to foreign holders of railway bonds. Such large river arteries as the Yangtze and the Pearl were closed to foreign shipping. On the other hand, a fairly lively trade in Japanese manufactured goods developed in the Yangtze ports. Discriminations were imposed on British shipping in North China ports. Japanese currency regulations added to the difficulties of foreign trade. The Japanese maintained a permanent military occupation of the part of the Shanghai International Settlement which lies north of Soochow Creek. There were instances of damage and looting of foreign property and a few cases of loss of life and serious injury on the part of foreigners during the military operations.

Japan and Great Britain.—Japanese feeling was especially inflamed against Great Britain, which was represented in many military and extreme nationalist leaflets and speeches as the chief enemy of Japan's aspirations on the mainland of Asia. There were a number of incidents at Shanghai, including several clashes between the International Settlement police and the police of the Japanese-sponsored Chinese administration. A British executive in a cotton mill, R. M. Tinkler, died of wounds which he received in a scuffle with Japanese soldiers in June 1939.

But the most serious Japanese-British conflict occurred in North China. Its immediate occasion was the refusal of the authorities in the British Concession of Tientsin to hand over to the Japanese four Chinese who were accused of having assassinated a Chinese customs inspector named Cheng who had taken office under the pro-Japanese administration.

Allegedly as a reprisal for British non-compliance in this matter the Japanese Army commenced to blockade the British and French Concessions in Tientsin on June 14. While the blockade was not an absolute one it slowed up and hindered the importation of food-stuffs, while British were singled out for indignities and insults when they tried to pass the barriers. They were in many cases completely stripped by Japanese sentries. At the same time an anti-British campaign was launched among Chinese in North China, with obvious Japanese encouragement. All British residents were forced to leave some towns in the interior. A Japanese

"IT'S YOUR TURN." A reference by Marcus of *The New York Times* to the Tientsin incident in 1939

military spokesman in Tientsin declared that Japan would not be satisfied with the handing over of the Chinese suspects and formulated others aims: to obtain British and French co-operation in establishing a new order in East Asia, to stop British support of the Chinese currency and to introduce pro-Japanese textbooks into the Chinese schools in the British Concession.

Grosser physical insults to Britons ceased toward the end of June; but the blockade, in somewhat milder form, was still going on at the end of the year. Conversations began in Tokyo in July between the Japanese Foreign Minister, Hachiro Arita, and the British Ambassador, Sir Robert Craigie, with a view to settling the Tientsin affair. On July 22 a joint formula was reached which the Japanese hailed as a complete surrender to their views, although the British Government repudiated this interpretation. The wording of this Arita-Craigie formula was as follows:

The British Government fully recognize the actual situation in China where hostilities on a large scale are in progress and note that, as long as that state of affairs continues to exist, the Japanese forces in China have special requirements for the purpose of safeguarding their own security and maintaining public order in the regions under their control, and that they have to suppress or remove any such acts or causes as will obstruct them or benefit their enemy.

His Majesty's Government have no intention of countenancing any act prejudicial to the attainment of the above mentioned objects by the Japanese forces, and they will take this opportunity to confirm their policy in this respect by making it plain to the British authorities and British nationals in China that they should refrain from such acts and measures.

The Chinese were finally handed over and a preliminary agreement was reached on Anglo-Japanese co-operation in suppressing terrorism in Tientsin. But the conversations failed to lead to any positive far-reaching agreement because the British Government, on August 20, declared itself unable to discuss, much less to enter into any agreement on currency and economic issues which involved the interests of other powers.

Japan and the United States.—The United States, in a note of October 6, published on October 27, complained of various alleged violations of the "open door" policy in China by Japan. The Japanese Government, in a reply dated November 18, disputed some of the American factual allegations, declared that the co-operation

of third powers in the economic development of China would be welcome and declared that Japan "was devoting its energy to the establishment of a new order, based on genuine international justice, throughout East Asia, the attainment of which is not only an indispensable condition of the very existence of Japan, but also constitutes the actual foundation of enduring peace and stability in East Asia."

The Reconstruction Finance Corporation extended to China a credit of \$25,000,000, to run for five years, in Dec. 1938. On Dec. 30, 1939, the American Government sent another note to Japan, indicating dissatisfaction with the arguments of the Japanese communication of November 18 and reiterating America's stand on the principles of international treaties regarding Far Eastern relations and the "open door."

The next important development in Japanese-American relations was the abrupt denunciation of the Japanese-American Treaty of Commerce and Navigation, signed at Washington on Feb. 21, 1911, by the U.S. Government on July 26, 1939. This denunciation very closely followed the announcement of the Craigie-Arita agreement and was interpreted in some quarters as designed to stiffen British resistance to Japanese demands. After a period of six months, after Jan. 26, 1940, the American Government will be free to impose discriminatory treatment on Japan in commercial relations.

Joseph Clark Grew, American Ambassador to Japan, told a largely Japanese audience in Tokyo on Oct. 19, 1939 that American public opinion is strongly and unanimously opposed to some of the things that the Japanese are doing in China. He declared that when Japan's "new order" is seen to be depriving Americans of their long established rights they oppose it and reminded the Japanese that they had insisted upon and received benefits from the "open door" in other parts of the world than China. Japanese press comment on the Ambassador's speech was generally to the effect that Japan had no intention of modifying its policy and that America had no right to interfere in Far Eastern affairs.

Japan and the Soviet Union.—While the Soviet Union has no concessions or extra-territorial rights in China, important causes of friction between Japan and the Western powers, there were several outbursts of sporadic fighting between Soviet and Japanese troops along the ill-defined frontier between the Japanese protectorate of Manchoukuo and the Soviet protectorate of Outer Mongolia.

The precise circumstances, scope, and results of this fighting are very obscure, because of the remote theatre of hostilities and the absence of impartial foreign observers. Amazing and probably greatly exaggerated figures of the numbers of aeroplanes shot down during these border clashes were circulated by both sides, but especially by the Japanese.

About the only reasonably certain fact about these conflicts is that they took place in the neighbourhood of Lake Buir and the Khalka river. Nomanhan, a small Mongol settlement, is frequently mentioned in statements about the fighting. The fighting seems to have gone on sporadically during May, June, and July 1939. The Japanese put forward the remarkable claim that they had shot down or otherwise destroyed 715 Soviet and Mongolian aeroplanes up to July 28. The Soviet counterclaim is that 199 Japanese aeroplanes were destroyed between May 8 and July 12, while the Soviet air force lost 52. The Soviet statement also asserted that between July 6 and July 12 Japanese-Manchoukuo casualties amounted to 5,500 killed and wounded, while 254 prisoners were taken, including 12 aviators.

No results proportionate to such losses seem to have been achieved by either side. The region of combat was a sparsely populated, semi-desert country, without large towns or important military objectives. A truce, which seemed to indicate an amelio-

ration of Soviet-Japanese relations, was concluded in September; but there were rumours of a resumption of hostilities in October.

A *modus vivendi* was found for a perennial subject of dispute, the conditions under which Japanese fishing companies may operate in Soviet waters, in March. But there was persistent bickering over the functioning of Japanese oil concessions in the northern, Russian half of the island of Sakhalin. Soviet help to China, perhaps the most serious cause of bad feeling between the Soviet Union and Japan, seems to have continued. In October there were reports from Japanese sources of an expansion of Soviet influence in the northwestern provinces of China, including Shensi and Kansu. It is not yet clear how the new Soviet expansionism in Europe will affect its policy in the Orient.

Education and Religion.—There were 47,750 schools of all kinds in Japan in 1936, with 14,949,792 students. Elementary education is compulsory, and the percentage of attendance among children of school age is 99.58. Japan has 45 universities with 71,607 students. Freedom of religion is guaranteed by the Japanese Constitution. The latest official statistics (end of 1933) reveal 41,127,307 Buddhists, 16,525,840 Shintoists, and 439,444 Christians in the country.

Army and Navy.—The Japanese Army is raised on a basis of universal liability to service of all male Japanese between the ages of 17 and 40. Its peacetime strength has been officially stated at about 230,000 organized in 17 divisions. All details of numbers and organization have been kept secret since the outbreak of the war. The strength of the Navy as of Sept. 30, 1936, was officially given as 302 warships, of a total tonnage of 1,134,823, including 9 battleships, 12 first-class and 25 second-class cruisers, 6 aircraft carriers, and 3 seaplane carriers. Under the latest fleet replacement law the naval building program from 1938 until 1943 called for the construction of 4 battleships, 2 aircraft carriers and a large number of cruisers, destroyers, submarines, and other vessels. Japan has consistently refused, since the expiration of the Washington naval treaties, to limit the size of its battleships or their gun calibre or to exchange naval building information with other powers.

Banking and Finance.—The unit of currency is the yen (worth approximately 23.65 cents in United States currency in Nov. 1939). The Japanese ordinary budget of 1939-40 (the Japanese fiscal year ends on March 31) calls for an expenditure of 3,694,666,000 yen, as against 3,514,521,000 yen in 1938-39 and 2,372,099,000 yen in 1936-37, the last pre-war year. Extra expenditure in connection with the war in China for the current fiscal year is estimated at 5,270,000,000 yen—a sum which will be almost entirely raised by new bond flotations. The Japanese national debt, which was 9,850,000,000 yen at the end of 1936, reached 15,524,209,000 yen in Oct. 1938 and had passed the 20,000,000,000 yen mark by the end of 1939. Much the greatest part of this debt is internal, Japan's foreign debts amounting to about 1,300,000,000 yen, as of the period before currency devaluations took place in almost all countries. The actual value of the foreign debt, in terms of present-day Japanese currency is somewhat greater, because almost the whole of Japan's foreign debt is in pounds and dollars and the yen has depreciated more than the pound or the dollar.

The Bank of Japan is the central bank of issue. The Yokohama Specie Bank is in charge of foreign exchange transactions and finances foreign trade. Commercial banking is largely in the hands of seven large banks: the Mitsui, Mitsubishi, Dai-ichi, Sumitomo, Yasuda, Daihyaku, and Sanwa. Foreign banks operating in Japan include the National City Bank of New York, the Hongkong and Shanghai Banking Corporation, the Chartered Bank of India, Australia, and China, the Banque Franco-Japonaise, and the Nederlandsch-Indische Handelsbank.

Trade and Communication.—Exports for the Japanese Empire in 1938 were 2,896,707,000 yen (a decline of 422,113,000 yen from 1937) and imports were 2,836,209,000 yen (a falling off of 1,118,517,000 yen, by comparison with 1937). Nominally this indicated a favourable trade balance of slightly over 60,000,000 yen. However, it is important to note that Japan's exports to so-called yen bloc countries in 1938 amounted to 1,182,261,000 yen, as against imports of 565,359,000 yen. These yen bloc countries include Manchoukuo and the occupied parts of China. Inasmuch as their currencies possess no value in international exchange Japan's effective trade balance was unfavourable to the extent of between 550,000,000 and 560,000,000 yen. The same tendency is visible in the incomplete figures for 1939. During the first seven months of 1939 Japan's exports were 1,960,079,000 yen (the figure for the corresponding period of 1938 was 1,517,329,000 yen). Its imports were 1,853,933,000 yen (1,705,999,000 yen in 1938). Japan's exports to non-yen-bloc countries during these seven months were 877,737,055 yen, while its imports from these countries were 1,308,933,743 yen, leaving an unfavourable balance of trade of 431,196,688 yen.

There were 15,254mi. of Government and private railways in 1937, in Japan Proper, besides 3,129mi. in Chosen, 935mi. in Formosa, and 300mi. in South Sakhalin. The total number of registered steamships in the Japanese Empire on Sept. 30, 1937, was 4,518, with a tonnage of 4,617,183. The number of sailing ships was 17,494, the tonnage 1,010,893. Japan had 235 commercial aeroplanes on Oct. 1, 1935. Air routes link up the main cities of Japan Proper and regular air service is maintained between Japan Proper, Formosa, the South Seas islands, Chosen and Manchoukuo. Air lines connecting Japan with such Chinese cities as Peking, Tientsin, Shanghai, Nanking, and Tsingtao were instituted in 1937 and 1938. During the year 1935-36 Japan's aeronautical companies carried 11,877 passengers, 75,643kg. of goods and 265,564kg. of mail. There were 10,570 telegraph stations in Japan Proper in 1937, and 11,920 post offices. There were 420,740km. of telegraph lines, handling about 67,500,000 messages annually. In Sept. 1937 there were 5,467 telephone exchange offices in Japan Proper, with 956,330 subscribers.

Agriculture, Manufactures, Mineral Production.—There were 5,597,465 farm households in Japan at the end of 1936. This figure shows little tendency to change from year to year. Much the most important crop in Japan was rice, with the breeding of silk worms as a secondary source of income for farmers in some parts of the country. Other agricultural products were wheat, rye, barley, oats, potatoes, and sweet potatoes. Animal husbandry plays a minor role and has mainly developed in Hokkaido, northernmost of the large Japanese islands. The rice crop for 1938 was estimated at 64,758,070 koku, a koku being equivalent to 4.96 bushels. This was slightly lower than the crop for 1937 but slightly higher than the average rice crop for the preceding five years. Some decrease was expected in 1939 because of inadequate rainfall.

Industry gives direct employment to about 6,000,000 people in Japan. Of these about half are occupied in tiny workshops employing less than five persons. These hand, or cottage, industries, where wages are extremely low, are an important factor in Japan's economy. The most important single industry is the output of textiles. Up to the outbreak of the war, which has caused a recession in the output of most of the peacetime industries, while promoting a boom in munitions and other war industries, Japan led the world in the production of rayon. Japan in 1937 was the leading exporter of cotton textiles, exports of cotton cloth amounting to 2,661,751,000 square yards. This was 1.7% less in volume, but 19.7% more in value than the figures for 1936. Japan's most striking gains in recent years have been in such heavy industries

as metallurgy, machine-building, and chemicals; and the war has accentuated this tendency. Japan ranks fourth in the world as a producer of chemicals. Other important industries are the generation of electrical power, foodstuffs, wood products, paper and ceramics. Mining output has been increasing under the stress of industrial demand. Publication of many industrial and mining statistics ceased in 1937 as a matter of war secrecy. (See also **ARMIES OF THE WORLD; COMMUNISM; CHINESE-JAPANESE WAR; FASCISM; UNITED STATES.**)

Jaspar, Henri (1870-1939), Belgian statesman, was born in Schaerbeek, a suburb of Brussels, on July 28. For his biography, consult *Encyclopædia Britannica*, vol. 12, p. 970. He was minister of interior and later minister of foreign affairs from 1920 to 1924, during which time he was instrumental in effecting Belgium's entry into the League of Nations. From 1926 to 1931 he was prime minister. He died February 15 in Brussels following an operation, only four days after King Leopold had asked him to form his second cabinet to succeed that of Paul-Henri Spaak, who had resigned February 9.

Java, fourth in size but most important in population and resources among the islands of the Dutch East Indies, is separated from Sumatra to the west by Sunda strait and from Bali to the east by Bali strait. With the adjacent small island of Madura, Java in 1930 had a population of 41,719,524, mostly people of Malay race professing the Mohammedan religion. The area of Java and Madura is 50,752 square miles. Java is the most densely populated land in the world, with 821 inhabitants to the square mile. Because of this density of population the economic crisis of 1929-33, during which period the quantity of Dutch East Indian exports declined by 17%, the value by 67%, brought a good deal of unemployment and distress. The number of labourers employed on large estates decreased from 1,200,000 to 600,000. The Government endeavoured to cope with this situation by organizing migration to the less thickly peopled neighbouring island of Sumatra and by encouraging the development of native industries. Another noteworthy result of the crisis was the marked increase in the purchase of cheaper Japanese goods. Japan's share in the import trade of the Dutch East Indies increased from 10% in 1928 to 30.9% in 1933. Further growth has been checked by the introduction of a quota system for Japanese goods. Approximately 40% of the land in Java is under cultivation. Java's principal exports in 1937, reckoned in tons were as follows: sugar, 1,137,666; shelled coffee, 98,849; tea, 66,716; tobacco, 47,832; cinchona bark, 6,345; copra, 498,241; pepper, 31,042; rubber, 483,124; tin and tin ore, 50,917. Jewish Race, Distribution of. It is practically impossible to ascertain the exact number of Jews in the world. In some of the countries where large numbers of Jews live, the census does not contain any questions as regards religion, in other countries especially in Asia no exact census is taken at all. It is also difficult to draw the exact delimitation of those included in the Jewish race. Most

census figures, as far as they consider the Jewish element at all, consider only members of the Jewish faith; and even this religious criterion is difficult of exact definition. The most reliable estimates give the number of Jews at present at about 16,500,000. Even the distribution according to countries has undergone great changes during late years. The National Socialist legislation in Germany, the conquest of Czecho-Slovakia and Poland by Germany, the anti-Semitic legislation introduced in Italy, Rumania, Hungary and Slovakia under the inspiration of National Socialism, has led partly to a decrease in the number of Jews, partly to a great shift in their distribution all over the world as the result of migratory movements. Poland before the war was the country in Europe with the largest number of Jewish inhabitants, estimated at about 3,325,000. Probably more than 250,000 perished as the direct result of the war, another 250,000 as the result of mass-persecution and starvation. Of the remainder about half came under the domination of Germany, the other half under the domination of the Soviet Union which now counts probably over 4,000,000 Jews and has the largest Jewish population in Europe, surpassed only by the United States where the number of Jews can be estimated at more than 4,500,000. Many Central European Jews have emigrated during later years to Great Britain, France, the United States, Latin American countries, Palestine and the Far East. This movement of migration has not yet come to its end by far.

Estimates for the numbers of the Jewish race vary greatly throughout the ages. In the 1st century A.D. they were estimated at 4,500,000 or about 8% of the estimated population of the Roman Empire. At about 1700 the number of Jews in the Old World was estimated at about 2,000,000. A rapid increase in the number of Jews began only with the end of the 18th century, a movement completely corresponding to a similar increase in the population of Europe and of the whole world. If we estimate the Jews at present at somewhat more than 16,000,000 and the population of the world at about 2,000,000,000, the Jews form about 0.8% of the total population. The increase in the Jewish population in the 20th century is practically everywhere slower than the increase in the surrounding non-Jewish population. Especially in Western Europe and in America the Jews show a sharply falling birth-rate. At present it may be estimated that of the 16,500,000 Jews about 9,750,000 live in Europe, 5,250,000 in the two Americas, 900,000 in Asia of whom half live in Palestine, 600,000 in Africa and about 35,000 in Australia.

In Europe there were ten countries with a population of more than 100,000 Jews (Poland, Soviet Union, Rumania, Germany, Hungary, Great Britain, Czecho-Slovakia, France, Lithuania and Netherlands), in America three (United States, Argentina and Canada), in Asia one (Palestine), in Africa three (Morocco, Algeria and South Africa). (See also ANTI-SEMITISM.) (H. Ko.)

Jewish Religious Life. The year 1939 was for Judaism the cruelest and blackest in 18 centuries. In Germany, Danzig, Memel, Slovakia and the Protectorate of Bohemia-Moravia, Nazi-organized technique for the rooting out of Jews and Judaism has gone ruthlessly forward through the burning of synagogues, confiscation of religious property, desecration of cemeteries, closing religious schools and the dissolution of communities following pillage, banishment or wanton murder of their members. In Hungary and Rumania and other neighbouring lands also synagogues were defiled and bombed.

Three million Jews in Poland have been given up to obliteration. Those in Western Poland absorbed by Germany have seen rabbis shot, synagogues destroyed, world famous Talmudic academies annihilated, religious scholars conscripted for forced labour and every element of organized Jewish religious life smashed. The

Jews in Eastern Poland have witnessed the communist ban on religious education, the prohibition of Hebrew instruction, rabbis deported, synagogues made into communist clubs and anti-God propaganda organized for the utter suppression of the Jewish religion.

The horrible fate facing Jews and Judaism in these lands filled the Jewry of adjacent countries with such grim fears that in free Yugoslavia so many sought flight in baptism that the Church had to set up unusually severe conditions for the would-be convert, and in Hungary the Union of Jewish Communities felt compelled to issue a proclamation calling on Jews not to desert their God and their people.

Great Britain's *White Paper* on Palestine, which threatened to nullify the Balfour Declaration and the Mandate for Palestine, caused such widespread consternation that Jews gathered in their synagogues to repeat the ancient pledge of the Psalms, "If I forget thee, O Jerusalem, may my right hand forget its cunning."

In democratic lands there has been a marked reaction of goodwill towards Jews and Judaism. In the United States Father Coughlin's quotations of Nazi libels were repudiated by representative Catholic leaders, while Protestant denominations and lay and religious leaders denounced every form of anti-Semitism. The Temple of Religion at the New York World's Fair was a steady witness to American democracy's interdenominational goodwill in contrast to the totalitarian States' war on religion. Outstanding also was the gift through John W. Burke of \$1,000,000 from the Friedsam Foundation to be used for Jewish religious education in New York city.

Jewish religious life has been made the poorer by the death of Adolph Buchler, principal of Jews' college, London; Israel Davidson, authority on Hebrew religious poetry; Moses Gaster, former chief rabbi of the Sephardim of Great Britain; Isaac Husik, of the University of Pennsylvania, religious philosopher; Jacob Meir, chief rabbi of the Sephardim of Palestine; Jacob Nemierower, chief rabbi of Rumania; Robert Lachmann, of the Hebrew university in Palestine, expert on synagogue music; and Israel Levi, former chief rabbi of France. (See also ANTI-SEMITISM.)

Jewish Welfare Board. The Jewish Welfare Board is a national organization which was founded on April 9, 1917, two days after the United States entered the World War, to serve the religious and welfare needs of men of the Jewish faith in the military forces of the United States. This work has been continued in peace time and has been expanded to provide service to disabled veterans, members of the Citizens Military Training Camps and of the Civilian Conservation Corps.

The Jewish Welfare Board is also the national organization of Young Men's Hebrew Associations, Young Women's Hebrew Associations and Jewish Community Centers, of which there are 324 in the United States and Canada, with a membership of 380,000 men, women, young people, boys and girls. These organizations own 242 buildings which are used as Community Centers. The local centres conduct a varied program of recreational, cultural and social activities. The Jewish Welfare Board furnishes to its member organizations consultation service on program, membership, financial and administrative problems; undertakes community surveys and institutional studies; conducts field service in connection with local Jewish centres; publishes program bulletins; issues *The Jewish Center* quarterly; conducts extension education activities; maintains a lecture and concert bureau; co-operates in local health and physical education programs; aids in the establishment and supervision of outdoor summer camps and home camps; conducts training courses for volunteers; aids in training

and placing professional workers; furnishes technical assistance in planning and equipment of buildings; and conducts campaigns for membership enrolment, building and maintenance funds.

The board has a department of vocational guidance and has made provision for the social and cultural adjustment of refugees through local centres. The board fosters regional federations of centres which promote inter-centre relations and activities and co-operate actively with the national organization. Regional organizations operate in New England, New York State, New York Metropolitan area, New Jersey, Pennsylvania and Middle Atlantic States, in the Mid-West, and on the Pacific coast. The board co-operates with the National Association of Jewish Center Workers, composed of professional workers in the Jewish centre field, whose annual meeting was held in Buffalo, N.Y., June 12-18, 1939.

The annual meeting of the Jewish Welfare Board was held in New York city Saturday evening, April 22, and Sunday, April 23, 1939. Judge Irving Lehman is president of the Jewish Welfare Board, and Louis Kraft is executive director. The offices of the Jewish Welfare Board are located at 220 Fifth avenue, New York city. (F. L. W.)

Johns Hopkins University, Baltimore, Md.; president, Isaiah Bowman, Ph.D., LL.D. Enrolment for 1939 in the several schools of the university was as follows: school of higher studies of the faculty of philosophy, 309; school of higher studies in education, 49; engineering, 364 (including 40 graduate students); arts and sciences, 476; business economics, 108; medicine, 297; hygiene and public health, 176. Enrolment in the afternoon and evening courses was 3,063, and in the summer school, 946. At the end of the fiscal year the endowment of the university was valued at \$30,387,195.78 and income from all sources for the year was \$2,691,014.09. During the year the following were elected to the board of trustees: Robert W. Williams, Baltimore lawyer and son of the first professor of geology at the university; John Lee Pratt, retired engineer and industrialist, of Chatham, Fredericksburg, Virginia; and Francis White, son and grandson of university trustees, and former assistant secretary of State. Carl R. Gray, vice chairman of the board of the Union Pacific and a trustee of the university since Feb. 7, 1938, died in May, 1939.

Johnson, Royal Cleaves (1882-1939), U.S. legislator and attorney, was born at Cherokee, Ia. on October 3. Admitted to the bar of South Dakota after receiving his LL.B. degree from the University of South Dakota in 1906, he practised at Highmore in that State, was State's attorney from 1909 to 1910 and attorney-general from 1911 to 1915. He was first elected to the U.S. House of Representatives in 1915 and retained his seat for 18 consecutive years until he retired in 1933 to return to the practice of law in Washington, D.C. Although he voted against the United States' entry into the World War, Johnson enlisted as a private in the Regular Army in Jan. 1918. He advanced to first lieutenant with the American Expeditionary Forces, was wounded at Montfaucon in Sept. 1918 and received the U.S. Distinguished Service Cross and Purple Heart and the Croix de Guerre. Johnson died at Washington, D.C. on August 2.

Jute. Overproduction, which had been severely troubling the jute industry, disappeared with the advent of war in Sept. 1939, and the increase in war-time demands, including 200,000,000 jute bags ordered by the British Government for delivery by Jan. 1940, to be used as sand bags. Government control of jute was instituted following the declaration of war, a maximum price was established and restrictions placed on output, except Government contracts and excepting 50% of other written contracts. The price restriction was soon withdrawn and a licensing system established under which the Government maintained control. No licence, however, was required for the purchase and sale of jute outside the United Kingdom or for the importation of jute. Production in 1939 was estimated as between 11,000,000 and 11,500,000 bales. The pucca, or export bale, in India weighs 400 pounds. The United States reported a rise in jute bags for sacking potatoes and of jute cloth for linoleum and other purposes immediately after the outbreak of war. (S. O. R.)

Juvenile Delinquency. In the field of juvenile delinquency two topics which continue dominant are the development of children's courts and probation, and the analysis of statistics. Approximately 3,000 Juvenile Courts were in session in the United States in 1939. The present trend is toward social treatment, and away from the penal rules of the common law. Combined juvenile courts and domestic relations courts have been tried in some jurisdictions, including New Jersey, Virginia, and New York city. The National Probation Association has summarized all important provisions of Juvenile Court laws of all States under topical headings. Interpretations, comparisons, and Supreme Court decisions are given.

The Federal Children's Bureau has analyzed the juvenile delinquency cases of 28 courts which have been reporting since 1929. These courts, located in 17 States, scattered widely, represent approximately 15% of the total population of the United States. The number of cases in 1938 was 29,971 as compared with 31,038 in 1937. During the past ten years there has been a general downward trend. In eight courts, including Philadelphia, one of the largest, the decrease was between 10% and 20%. In Hudson county, N.J., the decrease was 40%. Special service bureaus of boards of education and crime prevention bureaus within police departments have contributed to such substantial decreases.

Boys represent 84% of the total number officially handled by the courts. White children were involved in 73%; Negro children in 26%, and children of other races in 1%. This racial distribution for 1939 is similar to other years. Sex offences, running away, or being ungovernable, concern 60% of the girls. Among boys, approximately half were stealing, one-third were for acts of carelessness or mischief.

In proportion, more girls are committed to correctional institutions than boys. But for both sexes there is increasing use of methods of social adjustment, rather than institutional commitment. Gradual socialization of Juvenile Courts is noted in many communities, particularly in the reorganization of the courts of New Hampshire and Rhode Island.

(June 4, 1939); American Youth Commission Publications of the American Council on Education, Washington, D.C. (M. V. W.)

Kalich, Bertha (1874?-1939), Polish-American actress, was born in Lemberg, Galicia, where she made her first stage appearance. In 1894 she was offered the opportunity to appear in the Imperial theatre at Bucharest, provided she would learn the Rumanian language. This she did in three

months. Her part in *La Dame Blanche* in Bucharest was acclaimed by critics and public despite the wave of anti-Semitism then spreading throughout Rumania. American producers were promptly attracted by the press notices, and in the same year she went to the United States, where she appeared in Yiddish presentations in New York city. Among her vehicles in English were *Fedora* (1905), *Monna Vanna* (1905), *The Kreutzer Sonata* (1907), and *Magda* (1926). She returned to the Yiddish theatre in 1927 and retired in 1931. In private life she was Mrs. Leopold Spachner. She died in New York city on April 18.

Kameroons: see BRITISH WEST AFRICA.

Kansas, a central State of the United States admitted Jan. 29, 1861, popularly known as the "Sunflower State;" area, 81,774 sq.mi.; population according to the U.S. census of 1930, 1,880,999. (State census of 1939, 1,810,359, an increase over 1938 of 4,905 and the first increase in recent depression years.) Capital, Topeka, 64,120. (State census of 1939, 75,584.)

Topeka was the third city in size, the largest being Kansas City, 121,857 (State census of 1939, 127,423), and Wichita, 111,110 (State census of 1939, 111,718, substantial increases). Of the State's population (1930) 729,834 were urban, or 38.8%; 66,344 were coloured; 1,723,131 were native-born white and 69,716 were foreign born.

History.—In the biennial election of 1938, Payne H. Ratner, a Republican, was elected governor, together with a Republican legislature. Other State officers elected were Carl E. Friend, lieutenant-governor; Frank J. Ryan, secretary of State; George Robb, auditor; Walter E. Wilson, treasurer; Jay S. Parker, attorney-general; George L. McClelleny, superintendent of public instruction; Charles F. Hobbs, commissioner of insurance. At its regular session of 1939 the legislature enacted laws for the amendment and development of statutes relating to drainage districts, the conservation of oil and gas, grain warehouses, standards for dairy products, workmen's compensation and social welfare. More far-reaching in character was the adoption of a new corporation code and a probate code. This process of modernizing the State Government was to be carried further, the research department of the legislative council being instructed to study administrative and tax-collecting agencies, and the council was instructed to study the tax code for the purpose of revising and codifying the tax laws that have accumulated since 1861. One Republican campaign pledge, the exemption of food from the sales tax, proved impracticable; another, the abandonment of sales tax tokens, was carried out. A nine-member commission was authorized to stimulate the industrial development of the State, but the governor emphasized that the objective should not be a "trade at home" campaign but rather a promotion of all its assets, including its recreational attractions, as well as its products, industrial and agricultural.

Education.—The State has over 200 public libraries, of which over half are tax supported. There are 15 public and six private junior colleges, 15 private four-year colleges, one municipal, and five State-supported institutions of collegiate grade. Other State educational institutions include a vocational school and institutions for the blind and deaf. For the school year 1936-37, the last for which data are available, there were 6,636 one-teacher district schools in operation with an enrolment in the eight elementary grades of 83,100. There were 985 two or more teacher districts (excluding cities of first and second class) with enrolments in the elementary grades of 83,769. The 88 cities of first and second classes had elementary enrolments of 119,980. All classes of elementary schools showed declines in the number of children, a continuation of the depression trend.

Agriculture, Manufactures, Mineral Production.—According to the U.S. census of 1930, the four leading money crops of 1929 were wheat (50% of total crop value), corn (24.1%), hay (8%) and oats (3.2%). Winter wheat production for 1939 (U.S. Dept. of Agriculture estimates) was 111,657,000bu. as against 152,184,000 in 1938 and a 10-yr. average (1928-37) of 138,072,000. Corn production was 37,220,000bu. as against 45,200,000 in 1938 and a 10-yr. average of 80,736,000. Production of other crops was similarly low, except barley and commercial apples. Livestock inventories were relatively small. Winter wheat planting of 1939 was 12,913,000ac. as against 13,885,000 for 1938, which was reported by the U.S. Dept. of Agriculture as of December 1 at 35% of normal condition as against 61% at the same time in 1938. The leading manufactures, according to the U.S. census of 1935, were meat packing, flour, petroleum refining, railroad cars and equipment built in shops, butter, foundry and machine-shop products, bakery products, cement, feeds and printing with 1,508 establishments producing goods valued at \$468,690,290. The annual average of bituminous coal mined for 1926-30 was 3,215,000 tons. This represents a decline from 5,204,380 for 1919. The low point was reached in 1932 with 1,953,000 tons, with the 1937 figure standing at 2,892,560 tons and the preliminary figure for 1938 at 2,560,000 tons. The major portion of the State's mineral output was made up of petroleum and natural gas. (J. C. Mx.)

Kazakh S. S. R.: see UNION OF SOVIET SOCIALIST REPUBLICS.

Keitel, Wilhelm (1882—), German soldier, born September 22, was a commander of artillery during the World War. On April 1, 1934, he was promoted to major-general and the following year, when Germany introduced conscription, he took charge of the personal section (*Weftr-machtsamt*) in the war ministry, and was thus connected to a certain extent with the re-occupation of the Rhineland in 1936, and with the dispatch of German reinforcements to Nationalist Spain. In Feb. 1938, during Hitler's "army purge" of Gen. von Blomberg and other conservative members of the high command, Gen. Keitel, who was believed to be more complaisant to the Nazi Party's plans for an aggressive foreign policy, was appointed chief of the supreme command of the German armed forces. At the same time he was made a cabinet minister. In his new capacity he commanded the troops which invaded Austria in March 1938, conducted the military preparations which coincided with the Sudeten crisis six months later and directed the occupation of Czechoslovakia and Memel in March 1939. A firm believer in the merits of *blitzkrieg*, he threw the weight of the German Army and air force against Poland in September while conducting a more or less passive resistance against the Allies in the west and harassing their shipping.

Kelly, Walter C. (1873-1939), U.S. actor internationally known as "the Virginia Judge," a character he created in vaudeville, was born on October 29 in Mineville, New York. In his youth he was a machinist. He alternated his appearances as "the judge" with bit parts in legitimate-stage productions. His first major role was in the Theatre Guild's production of Maxwell Anderson's *Both Your Houses* in 1933. He retired in 1936 and died in Philadelphia on January 6.

Kennelly, Arthur Edwin (1861-1939), American electrical engineer, was born in Bombay, India, on December 17. He was educated in private schools of France and England and at University College school, London. Beginning as a telegraph operator in 1876 in England, he later became chief electrician of a cable-repairing vessel and senior ship's

electrician of the Eastern Telegraph Cable Company. From 1887 to 1894 he was the chief assistant to Thomas A. Edison and in the latter year he became associated with a firm of electrical engineers in Philadelphia. In 1902 he joined the faculty of Harvard university as professor of electrical engineering and continued teaching until 1930. He held the same academic post at Massachusetts Institute of Technology from 1913 to 1924. He was co-discoverer with the English physicist Oliver Heaviside of the Kennelly-Heaviside layer, a conducting layer of ionized gas in the upper atmosphere which has a peculiar effect upon electromagnetic waves. He invented a hot-wire ammeter and other devices which brought him a score or more of academic and scientific recognitions, including the Edison gold medal in 1933. He died in Boston on June 18.

Kentucky, an east south central State of the United States, admitted June 1, 1792, popularly known as the "Blue Grass State," area 40,598 sq.mi.; population (U.S. census, 1930) 2,614,589; estimated (July 1, 1937) 2,920,000. Capital, Frankfort, 11,620; the largest city, Louisville, had 307,745 inhabitants (1930). Of the State's population, 799,026 were urban, or 30.6%, 2,366,524 were white, 236,040 coloured, and only 21,840 foreign born. Death rate low: 9.9 per 1,000 in 1938.

History.—On Oct. 9, 1939 Governor A. B. Chandler resigned his office to fill the unexpired term of Senator W. M. Logan, deceased. Lieut. Gov. Keen Johnson, who succeeded him was nominated in the August primary, and elected in November by 460,834 to 354,704 votes over his opponent, King Swope (Rep.). Other State officers, also Democratic, were R. K. Myers, lieutenant governor; H. Meredith, attorney general; J. W. Brooker, education; W. H. May, agriculture. Only one Republican was elected to any State board. The General Assembly also is strongly Democratic: 28 of 38 votes in the Senate and 72 of 100 votes in the House. There was no meeting of the Assembly in 1939, but the Legislative Council prepared a number of measures pertaining to increased payments for the aged poor, unemployed, the Teachers' Retirement fund, and budgetary problems in general.

Efforts of the United Mine Workers to secure a new contract in the Appalachian field in April assumed national importance. The Operators' Association of Harlan county resisted extreme demands by John L. Lewis, who denounced Governor Chandler as an enemy of Labour. In reply, the Governor sent troops, May 10, to maintain order, increasing the force as union agitators became active. The U.S. courts indicted 52 coal companies for conspiracy. In August peace was imperilled by a clash in Bell county, but only one death could be directly attributed to some five months of military occupation. The operators finally signed varying contracts, and on October 3 the courts dismissed the cases against the companies. An unusual combination of firmness and tact characterized this protracted struggle.

Education.—The per capita distribution of the Common School fund, designed to assist the poorer districts, was the largest ever made—\$12.19. The school census figures, however, were in need of correction by the Federal Census of 1940, in the opinion of the new State superintendent. In Nov. 1939, Frank L. McVey, President of the University of Kentucky, reached the retirement age without definite indication of his successor.

Charities and Correction.—The governor appointed Miss Margaret Woll as Commissioner of Public Welfare, replacing Frederick Wallis, resigned. At Lyndon the State purchased the Children's Home Society's property and now supervises the care and placing out of orphans. When the new prison at La Grange was finished, convicts were transferred from the old prison at Frankfort.

Finance.—In the fiscal year 1938-39 the receipts in the general

fund were \$41,395,406. Outstanding bonds on nine toll bridges and eight interstate bridges now stand at \$8,936,000. The floating debt of Kentucky has increased slightly. Reduction of revenue from the liquor trade, invalidation of the chain store tax, and increased payments for social welfare combined to increase the floating debt to \$6,953,703 as against \$5,500,000 in 1938. The main increase in expense under the Chandler administration, as compared with his predecessors, was for public buildings and public relief. Partial unemployment insurance started in Jan. 1940. There has been a steady but striking decline in receipts from the alcoholic beverage tax. This tax yielded (in millions) 9.2 in the fiscal year 1936-37; 7.1 in 1937-38, and only 5.6 in 1939. The corporation income tax totalled \$1,500,000; personal income tax, \$1,959,000; inheritance tax, \$1,866,000. Forty-nine

counties were "dry" and 27 counties were in default on their local bonds on June 30.

Agriculture and Manufactures.—Tobacco, the chief crop, was estimated in 1939 at 313,646,000lb. of all types, compared with 342,238,000lb. in 1938. Both in production and manufacture of tobacco, however, Kentucky now is second to North Carolina. Sales on the Kentucky open markets in the season of 1938-39 amounted to 251,000,000lb. at an average price of 19.48

KEEN JOHNSON succeeded A. B. Chandler as governor of Kentucky in 1939

cents. In a referendum in November the tobacco planters endorsed a national restrictions plan for 1940. The corn crop of 1939 was estimated at 70,400,000bu. compared with a ten-year average of 62,688,000 bushels. Irish potatoes yielded 3,864,000bu. compared with 4,635,000bu. in 1938. The apple crop was disappointing—only 300,000 bushels. There was some increase in the production of wheat and sorghum. Of the varied mineral resources, which include rock asphalt and fluorspar especially, the chief commercial output is coal. In 1938 this industry employed 55,418 men who produced 39,689,449 tons. The loss of life was only 98 as compared with 141 in 1937. Petroleum lifted increased to 5,777,058bbl., due in part to new wells in Davies county. The natural gas yield was estimated at 38,000,000,000 cubic feet.

Kidnapping. The number of kidnappings in the United States during 1939 was the lowest since 1934 and represented a marked decline from the number recorded in 1938. The annual total of kidnappings jointly investigated by the Federal Bureau of Investigation and by State and local police, under the terms of the Federal Kidnapping Act of June 22, 1932, appears in the table on p. 389. Since the purpose of kidnapping may be the extortion of ransom, or may be motivated by some quite different crime, such as rape or robbery, the table shows the total number of kidnappings, and also the number wherein ransom was demanded for the release of the victim.

All but two of the foregoing cases have been solved. Prosecu-

tions in Federal and State courts have resulted in the conviction of 328 defendants. The sentences imposed included nine death sentences, 45 sentences for life, and others for varying terms totalling 3,790 years. During this same eight-year period, two kidnappers were lynched, five committed suicide, and seven were murdered. Eight others were killed under varying circumstances.

On Dec. 19, 1939, eighteen persons were under indictment for

Year	Total Number of Kidnappings	Number Wherein Ransom Demanded
1932	5	5
1933	14	10
1934	18	5
1935	26	1
1936	31	1
1937	20	4
1938	37	5
1939 (to Dec. 19)	19	0
Total	170	31

violations of Federal kidnapping statutes. Some of these persons were already serving sentences for other crimes. Active participation by the Federal Bureau of Investigation continues to be the most important factor in the suppression of kidnapping in the United States. Official reports of kidnapping in England and Wales are confined to stealing children under 14 years of age. The record since 1900, summarized from available official sources, is as follows:

Five Year Averages	Annual Totals
1900-1904	15
1905-1909	10
1910-1914	7
1915-1919	8
1920-1924	4
1925-1929	4
1930-1934	5

Unusual kidnappings of the year included the seizure of the Rev. J. H. Goldner, and his son, the Rev. G. R. Goldner, American missionaries, by Arab bandits in Palestine on July 20, 1939. Upon release of the elder Goldner, he offered to pay the ransom demanded and his son was subsequently released.

Frank Poletti, Italian postal commissioner, was kidnapped in Peiping on Jan. 10, 1939. Ransom was paid through the Italian Embassy.

H. F. Dyott, Chairman of the British Chamber of Commerce, was seized by bandits at Tientsin, March 18, 1939 and held for ransom.

O. Lampe was kidnapped by bandits April 29, 1939, at Guana-juato, Mexico; his family received a demand for ransom on the following day.

With the arrest of five Japanese and one Mexican in Los Angeles on July 30, it was announced that an international kidnapping ring had thereby been broken. (See also FEDERAL BUREAU OF INVESTIGATION.)

Knights of Columbus. At the 57th annual meeting of the Supreme Council, held in Seattle, Wash., August 15-17, Francis P. Matthews, of Omaha, Neb., was elected Supreme Knight, in succession to Martin H. Carmody, who had held that office since 1927. John E. Swift, of Milford, Mass., was chosen Deputy Supreme Knight. Joseph F. Lamb, of New York, N.Y., was named Supreme Secretary, replacing William McGinley who had served since 1909. Rev. Leo M. Finn, of

Bridgeport, Conn., is Supreme Chaplain. The national offices are located at New Haven, Conn.

Success attended the efforts made during 1939 to develop study clubs, forums and other activities of a cultural and intellectual nature. Particular emphasis was laid upon the crusade against atheistic Communism and other subversive movements in the United States. A positive crusade was undertaken to promote a better understanding of the remedies offered by the recent popes, in their encyclicals, for the social and economic reform of society. Catholic Action was advanced through the lectures of Paul McGuire of Australia, and others who toured the country, and through the wide distribution of Catholic literature dealing with Christian social reconstruction. Notable advances were also made in the Boy Life Bureau. The total membership for the current year is 417,150. The insurance membership numbers 218,491. Of the 39,618 members initiated during 1939, 14,391 were insurance members. The amount of life insurance applied for during 1939 was \$18,902,000, an increase over the 1938 figure of \$13,612,000. Insurance benefits totalled \$2,998,221, as against \$2,874,368 in the preceding year. There are now, in active condition, 2,470 Councils, located in every State of the Union, in the Dependencies, and in Canada.

Organized in 1882, this fraternal and benevolent order is dedicated to strengthening and defending Catholic principles. Membership is limited to Catholics in good standing. The official publications include *Columbia*, a monthly, and a *News Weekly*.

Krupskaya, Nadezhda Konstantinovna (1869 - 1939), Soviet educationalist and widow of Lenin, was born in St. Petersburg on February 26, the daughter of an impoverished army officer who died when she was a young girl. With the money she had earned as a tutor she studied for five years at the new Woman's college in St. Petersburg and graduated with distinction. From 1891 to 1896 she taught geography in Sunday schools, during which period she became a fervent convert to Marxism. She met Lenin in 1893 and with him was exiled to Shushinsk, Siberia, after she had participated in a workers' strike in 1896. They were allowed to marry in 1898, and after their release from Siberia the next year they went to Munich, where Krupskaya helped her husband organize secret revolutionary units in Russia. They were permitted to return to Russia in 1905 but were ejected again in 1908, whereupon they continued their underground activities in Prague, Paris and Cracow—Krupskaya in the meantime studying pedagogy. When Kerensky was overthrown and Lenin installed in power, Krupskaya became a member of the people's commissariat of education and drafted the party's plan for popular education. In Jan. 1938 she was elected to membership in the Presidium of the U.S.S.R.; she was also a member of the central committee of the communist party and vice commissar of education. As Lenin's widow she was revered throughout Russia despite several well-known disputes with Stalin; and her 70th birthday, the day before her death, was the occasion for a popular celebration in Moscow. She died in her apartment inside the Kremlin wall on February 27.

Kyanite. Its adaptability for the production of special high temperature refractories has led to a gradual increase in the demand for kyanite, which has been supplied by produc-

tion from North Carolina, Georgia, Virginia and California, and by imports from India, where production amounted to 29,231 long tons in 1937. Imports into the United States were 3,964 short tons in 1937, all from India. The related minerals, sillimanite and andalusite, which have the same chemical composition as kyanite, but a different crystal structure, are also used for the same purpose.

Labour Party. The 38th annual conference of the British Labour Party was held at Southport at Whitsuntide, 1939. The issues before it related to the international situation and to the movement for a "Popular Front" headed by Sir Stafford Cripps, who, with certain of his leading followers, had been expelled from the party for defiance of "party discipline" in collaborating with members of the Liberal and Communist parties in a campaign against the official policy. Sir Stafford Cripps was allowed to appear and state his case; but a proposal to endorse the "Popular Front" was overwhelmingly defeated by 2,360,000 votes to 248,000. The expulsions therefore stood; but except for Sir Stafford Cripps most of the expelled members have since been re-instated.

On the international situation, the conference carried almost unanimously a resolution in favour of a pact of mutual aid against aggression, to be based on a triple pact between Great Britain, France, and the Soviet Union. It also protested strongly against the betrayal of Czechoslovakia and the failure of the British Government to check Fascist intervention in Spain and Japanese aggression in China. On the outbreak of war the party, in conjunction with the Trades Union Congress General Council, strongly supported the policy of resistance to Nazi aggression, but refused to join a coalition government. It agreed, however, for the time being to an electoral truce, and also to legislation dispensing with elections to local authorities, for the war period.

The leader of the parliamentary Labour Party, C. R. Attlee, was away ill through the early months of the war, and his place was taken by Arthur Greenwood. Late in 1939, however, Mr. Attlee returned to his leadership; and he was duly re-elected leader for 1940.

At the end of 1938 the Labour Party had a national affiliated membership of 2,642,618, as against 2,527,672 a year previously. Individual membership of the constituency parties, which numbered 614, reached 250,705 men and 178,121 women—a reduction on the totals for the previous year (258,060 and 189,090). The affiliated trade union membership was 2,170,408, as compared with 4,669,000 represented at the 1939 Trades Union Congress. The proportion of "contracted-in" trade union members (*i.e.*, members paying the political levy) thus averages under one-half; but there are wide differences between trade unions in this respect, the unions of less skilled workers having on the whole considerably higher percentages of Labour Party members than the craft unions.

Over most of Britain, the Labour Party's policy of support for the war has been endorsed by the local parties. There is, however, evidence of fairly strong pacifist opposition in parts of Scot-

land. During 1939 the Communist Party ordered its "secret" members who had been occupying official positions in the Labour Party to withdraw from it, presumably as a preparation for the impending change in communist international policy. This caused a few local resignations of some importance; but neither this factor nor the troubles arising out of the Cripps "Popular Front" campaign seriously affected the internal organization of the party.

(G. D. H. C.)

Labour Unions. Labour developments in 1939 reflected the marked improvement in business which began the year before and the political influence on organized labour of the approaching presidential election of 1940. Labour relations were much more disturbed than in 1938 and the number of employees engaged in strikes substantially increased. No successful contribution to peace within the labour movement resulted from efforts of the President of the United States to compose the differences which continued to divide the C.I.O. and the A.F. of L. The National Labor Relations Board and the law which it administers were vigorously attacked by the A.F. of L. and the employers, and were made the subject of a far-reaching investigation by a special committee of the House of Representatives. Because of this investigation, charges brought against a number of unions for violation of the anti-trust laws, and local reactions against organized labour, there were indications during the year of the possibility of material revision of the National Labor Relations Act and, perhaps, of the whole labour policy of the Federal Government.

The leading strikes—the industry-wide shut-down of the bituminous coal industry and the prolonged strikes in the plants of the General Motors and Chrysler corporation—were aimed primarily toward strengthening the positions of the United Mine Workers and the United Automobile Workers. The miners' union, the dominating organization in the C.I.O., sought to protect itself against the Progressive Miners, the union of coal miners affiliated with the American Federation of Labor. In several important regions of the coal industry, notably Harlan county, Kentucky, as well as Kansas and Oklahoma, the Progressive Miners were making considerable headway among the miners, were chartering new locals, and, in some cases, taking over local unions affiliated with the United Mine Workers. These tactics and the fears they engendered forced the United Mine Workers to modify their traditional policy and demand arrangements tantamount to a closed-shop. In the negotiations for the renewal of contracts, held in the spring of 1939, this demand precipitated a general shut-down of the coal mines and a prolonged strike, which was settled only after presidential intervention on May 11. The United Mine Workers won their principal demand, protected themselves effectively against the Progressive Miners, and in the process obtained union contracts in hitherto unorganized parts of the industry.

Similar considerations accounted for the General Motors strike of July and the Chrysler strike of Oct. 1939. In this industry the union of automobile employees, though claiming a large membership, had won only limited recognition from the Chrysler and General Motors companies, and was not at all recognized by the Ford Company. As a result, further, of dissension within the union an important faction had broken away and become affiliated with the A.F. of L. To protect itself against this rival union as well as to strengthen its ties with its members, the United Automobile Workers, affiliated with the C.I.O., made extensive demands upon General Motors. When these were denied by the company, a strike was called. Several months later restrictions of output (slow-downs) practiced by members of the union, caused the shut-down of the Chrysler plants and initiated a strike of nearly two-months' duration. In the negotiations for the settlement of this, as of the General Motors strike, the basic union

demands were concerned with establishing the union as the sole and permanent labour organization in the industry. Although the union received minor concessions in both settlements, on the main issues of the closed-shop and the union's control over the shops its demands remained unsatisfied.

On a minor scale, the C.I.O. union of seamen attempted to win the same concessions by demanding from shipping companies on the East coast control of hiring-halls. When these demands were denied, the union struck against a number of the companies, including the Standard Oil Companies of New Jersey and New York and the Texas Company. The strike was lost and the union, for the time being, eliminated from the ships of these companies. These efforts to turn the better business of 1939 to union account greatly increased the time lost through strikes. It is clear that the number of man-days lost was more than double that of 1938, substantially exceeded the number in 1936, but fell appreciably short of 1937—the most disturbed year in the recent period of union organizing activity and labour unrest.

How much progress organized labour made during the year it is becoming increasingly difficult to determine from the reports published by the two leading federations of labour. The C.I.O., for reasons of strategy, failed to submit the usual financial statement to its annual convention and, therefore, to make available the only satisfactory data for checking its claims of membership. The A.F. of L., whose financial statement was issued as in the past, claimed a further substantial increase in the membership of affiliated organizations. In their struggle for members, the A.F. of L. appears on the whole to have made the most progress. The United Textile Workers, one of the original group of Federation unions to join the C.I.O., abandoned that organization and was readmitted into the A.F. of L. The Ladies Garment Workers, another union of the same class and one of the largest unions in the country, has quite definitely withdrawn from the C.I.O. and is reported to be considering reaffiliation with the Federation. In the automobile industry, the A.F. of L. now has a union of its own, which, though small, is in a position to make trouble for the C.I.O. union and to grow at its expense. Both federations are doubtless suffering from the rise of a considerable number of plant and local unions, unaffiliated with either the A.F. of L. or the C.I.O., whose number and importance is increasing throughout the U.S.

The growing tension between the C.I.O. and the A.F. of L., which characterized their relations during 1939, rendered unlikely an early peace and amalgamation of the two factions. The promising negotiations of the spring, initiated by the President, were adjourned for the duration of the miners' strike and were never resumed. The messages sent by the President to the two annual conventions of these organizations, held in the fall of the year, were aimed to force a resumption of these conversations. But, although the messages were acknowledged, there was apparently no agreement to hold a new conference and it is the general opinion that the two organizations are further apart than at any time since their initial rupture in 1935. In fact, the latest step taken by the C.I.O. in organizing rival unions in the building industry seems calculated to make a settlement all but impossible.

The chief sufferers from this dispute were the Labor Relations Board and the Wagner Act. Opposition by the A.F. of L. to the board's policies and personnel prevented the confirmation by Congress of a member of the board, nominated for reappointment by the President. In his place the President appointed W. M. Leiserson, chairman of the railroad National Mediation Board, who shortly became a severe critic of the board's procedures and staff. The scope and vigour of the complaints made by the A.F. of L. were a powerful factor in promoting the latest Congressional investigation of this whole matter. This inquiry, begun in December by a House committee of which Congressman Howard W.

Smith is chairman, was preceded by thorough examinations of the board's records. The minutes of the committee's first sessions indicate that it has undertaken a searching review of the board's methods of operation and of the consequences of the Wagner Act.

The board meanwhile has made little change in policy. But it met many reversals, particularly in the lower courts. Two decisions late in the year rejected the board's findings that the company unions in question were employer dominated. A decision of fundamental importance by the Circuit Court of Appeals in the Inland Steel case not only reversed the Board by holding that the Wagner Act did not require an employer to make a written contract with the union but also severely criticized the board's handling of the whole proceedings. The United States Supreme Court has continued to uphold the decisions of the board. But this court, too, in the well-known *Fansteel* case, involving the rights of sit-down strikers, completely reversed the board's decision and refused to sanction an order requiring the reinstatement of sit-down strikers. (See also LAW [CASE]: *Labour*.)

The acts of trade unions were attacked also from another direction. In proceedings under the Sherman Anti-Trust Act, the Federal District Court of Philadelphia, in a decision issued April 3, awarded the Apex Hosiery Company damages of \$700,000 against the hosiery workers' union. The decision was reversed by the Circuit Court of Appeals on the grounds that the acts of the union were not obstructions to interstate commerce and has been appealed to the Supreme Court. No litigation since the famous *Danhury Hatters'* case has so aroused organized labour as has this threat to bring unions under the provisions of the anti-trust law. But not long thereafter the United States Department of Justice instituted proceedings under the same statute against unions in the building and trucking industries. These latest moves brought a strong protest from William Green, president of the A.F. of L. Attorney-General Murphy, however, asserted the department's intention to proceed with the indictments. (See also AMERICAN FEDERATION OF LABOR; CONGRESS OF INDUSTRIAL ORGANIZATIONS; STRIKES AND LOCK-OUTS.) (L. Wo.)

Great Britain.—Trade unionism in 1938 and 1939 continued its recovery from the effects of the world slump. In 1938 total trade union membership rose by 3.6% to 6,054,000. This was a much slower rate of advance than in 1937, when membership rose by over 10%, the fall in the rate of increase being due to the recession in industry. Complete figures are not available for 1939; but the Trades Union Congress which met in Sept. 1939 represented 4,669,000 members, as against 4,461,000 in 1938. Owing to war conditions, the congress met for only two days instead of the customary week, and most of the time was taken up with emergency questions, including a report on the international situation, in which the Congress declared its strong support of resistance to Nazi aggression. The General Council of Congress also received larger powers to deal with inter-union disputes and to undertake campaigns for increasing trade union membership. Owing to the scarcity of trade disputes, trade union funds increased during 1938, the accumulated balances of 426 registered unions amounting to over £20,000,000 at the end of that year, or twice as much as in 1928, when funds had been hadly depleted in consequence of the general strike.

France.—The trade unions entered in 1938–39 on a period of increasing difficulty. In Nov. 1938 the unsuccessful attempt at a general strike against M. Reynaud's new decrees was followed by Government action against the strikers. A discretionary amnesty, subject to numerous exceptions, was approved by the Chamber in Feb. 1939; but a serious blow had been dealt to the power of the *Confédération Générale du Travail*. During 1939 there was increasing tension inside the unions between the communist and non-communist elements; and this tension became much more

acute when the Communist Party, on the outbreak of war, took up an anti-war attitude, and was outlawed by the Government. The leaders of the C.G.T., in common with the Socialist Party, took up a strong line against the communists, and at the beginning of October M. Léon Jouhaux, the C.G.T. secretary, demanded the elimination of all communists from positions of influence in the trade unions. By agreement with the Government, the election of delegates in the workshops was suspended for the period of the war, the delegates being nominated instead by the trade unions concerned. No recent figures of C.G.T. membership are available.

International Federation of Trade Unions.—The eighth Triennial Congress was held in July 1939, with Sir Walter Citrine as president. It announced a rise in membership from 13,000,000 to nearly 19,000,000 since the 1936 Congress, despite the loss of the affiliated movements in Czechoslovakia, Spain and Austria. The trade union movements of the United States (A.F. of L.), Mexico and New Zealand had meanwhile joined the I.F.T.U. The congress had before it a British motion recommending that the Russian trade union movement should be invited to affiliate to the I.F.T.U. This was supported by France, Mexico and Norway, but was defeated by 46 votes to 37, the American and Swedish delegates taking up an attitude of especially strong opposition. The congress, however, carried a resolution in favour of an Anglo-French-Russian pact against aggression, and adopted strong resolutions against racial persecution, and the suppression of industrial liberties in the Fascist countries, and in favour of a renewed agitation for a shorter working week. In October the Bureau of the I.F.T.U., meeting in Paris, unanimously supported the action of the British and French unions in helping to "defend liberty, democracy and civilization against the aggression of the totalitarian States."

The resolution went on to declare that peace could be restored only on a basis of respect for the rights of man and of the peoples to self-government. (G. D. H. C.)

Labrador: *see* NEWFOUNDLAND AND LABRADOR.

Laemmle, Carl (1867–1939), U.S. motion picture producer and executive, was born January 17 at Laupheim, Germany, and moved to the United States in 1884. After clerking in various stores in New York city and Chicago he managed a clothing house in Oshkosh, Wis., until 1906, when he opened a motion picture theatre in Chicago.

In the same year he founded the Laemmle Film Service. Moving to Hollywood, he began production of motion pictures, and in 1912 he merged the leading independent producers into Universal Pictures Corporation, of which he was president until 1936. He died at Beverly Hills, Calif., September 24.

La Guardia Field: *see* AIRPORTS.

Lambert, Alexander (1861–1939), U.S. physician and former president of the American Medical Association (1919) was born in New York city on December 15 and was educated at Yale and Columbia universities. In 1894 he became attending physician at Bellevue hospital, New York city, and a bacteriologist on the staff of the New York Health department. Four years later he was appointed professor of clinical medicine at Cornell university. Dr. Lambert was a leading authority on the treatment of alcoholism and drug addiction.

He died in New York city on May 9.

Land Banks: *see* FEDERAL LAND BANKS.

Langsdorff, Hans (1894–1939), German naval officer, was born March 20 at Bergen, on the Isle of Ruegen. He joined the imperial navy as an ensign in April 1912 and was advanced to lieutenant three years later. During the battle of Jutland May 31, 1916, he saw action aboard the battleship "Grosser Kurfuerst" of the High Seas fleet. Later he commanded flotillas of minesweepers and torpedo boats. In 1935 he became chief of staff officers of the German Admiralty and in 1938 he was appointed commander of the pocket battleship "Admiral Graf Spee." After the European war began the ship shuttled between South America and Africa, raiding commerce and sinking nine British merchantmen. After an all-day battle with three British cruisers December 13 the "Graf Spee," badly damaged, put into the harbour of Montevideo, and four days later Langsdorff, upon orders from Hitler, blew up the ship (*see* EUROPEAN WAR). He then took his crew to Buenos Aires where, after internment, he shot himself to death December 20.

Laos: *see* FRENCH COLONIAL EMPIRE.

Latin America, also called Hispanic America, is the portion of the American continent deriving its culture and institutions largely from Spain and Portugal. Latin America includes 20 republics and the United States dependency of Puerto Rico. Spanish is spoken throughout, except in Brazil (Portuguese) and in Haiti (French). English is legally on a parity with Spanish in Puerto Rico. Indigenous languages and dialects are used by large numbers in some regions, particularly in Mexico, Central America, Ecuador, Peru and Bolivia. The area is approximately 8,050,000 square miles. The people are white, mestizo and Indian, with negroid elements predominant in the Dominican Republic and Haiti, and prominent in Brazil, Cuba and on the Caribbean coast. The population (1939 estimate) is about 114,000,000. The chief cities are: Buenos Aires, 2,345,221; Rio de Janeiro, 1,871,830; São Paulo, 1,167,862; Mexico City, 1,229,576; Santiago de Chile, 859,830. During 1939 no political changes were effected by force, although serious, abortive revolutions occurred in Peru and Bolivia. Impending presidential elections in Costa Rica, Cuba, Ecuador and Mexico, scheduled for 1940, gave rise to some political unrest, especially in the last two.

Outbreak of the European war in Sept. 1939 brought serious economic dislocation throughout Latin America, disrupting communications with European markets and preventing delivery of goods already ordered and paid for. An inter-American congress met at Panamá in September to discuss and plan joint action of all the American republics. Similar consultations on special problems were subsequently held. (*See* HISPANIC AMERICA AND THE EUROPEAN WAR.) The Latin American members of the League of Nations assumed leadership in forcing the expulsion of Russia from the League after her attack on Finland in December.

Every country except Bolivia has important agricultural resources, with wheat in Argentina, coffee in Brazil and the Caribbean States, and sugar in Cuba, the economic mainstays. The pastoral industry is outstanding in Argentina and Uruguay. Venezuela, Mexico, Colombia, Argentina, Peru and Ecuador are important for petroleum. Mexico and the Andean republics of South America are leading metal producers. Manufacturing is developing rapidly, but is inadequate for domestic needs, and manufactured goods and foodstuffs comprise the chief imports, with exports the respective leading products of each country. In 1937 the imports of the 20 republics aggregated approximately \$1,630,829,000, the exports \$2,396,054,000. The United States led in total trade, Great Britain was second, with Germany a close third. The Roman Catholic faith is predominant in all countries, with, however, a varying degree of relationship with the Church itself.

Latter Day Saints: see MORMONS.

Latvia, area 25,016 sq.mi.; pop. (est. Dec. 31, 1938) 1,994,500. Chief towns (pop. 1935): Riga (capital, 385,063), Liepaja (57,098). President, Karlis Ulmanis; language, Latvian; religion, Christian (Protestant 55%, Roman Catholic 24.5%, Greek Catholic 9%, Greek Orthodox 5.5%).

History.—The whole of Latvia's national effort during 1939 was devoted to the preservation of her neutrality both before and after the outbreak of war in Europe. She already had a non-aggression pact with Russia, and on June 7 she balanced this by signing a similar pact with Germany. While negotiations between Russia and the Western democracies were still in progress, Latvia made no secret of her dislike of the Soviet proposals for guaranteeing her neutrality; but after the conclusion of the Russo-German pact and the collapse of Poland, Latvia fell into line with the other Baltic States by acceding to Russia's demand for naval bases at Liepaja and Ventspils and for aerodromes and artillery bases on Latvian territory. The Soviet-Latvian pact was signed on October 5 (see also UNION OF SOVIET SOCIALIST REPUBLICS). The Government had called up some reservists on September 8, and on September 28 a state of emergency had been proclaimed and the setting up of a council of defence decided upon; but on November 8 the reservists were ordered to be disbanded.

On October 30 an agreement was reached with Germany regarding the repatriation to the Reich of German Balts and the disposal of their property. The affected German minority in Latvia amounted to some 62,000.

Education.—In 1938-39: elementary schools, 1,895; scholars, 229,825; secondary schools 114; scholars 25,225.

Banking and Finance.—Revenue (est. 1939-40) 198,852,000 lats; expenditure (est. 1939-40) 198,696,000 lats; public debt (June 1, 1939) 146,491,000 lats; notes in circulation (July 31, 1939) 81,001,000 lats; gold reserve (July 31, 1939) 97,869,000 lats; exchange rate (up to Sept. 12, 1939) 25-22½ lats=£1 sterling.

Trade and Communication.—Foreign trade (merchandise): imports, total (1938) 227,336,000 lats; (Jan.-June 1939) 118,340,000 lats; exports, total (1938) 227,204,000 lats; (Jan.-June 1939) 117,830,000 lats. Communications 1939: roads, suitable for motor traffic 1,715mi.; railways, open to traffic 2,081mi.; inland waterways 2,776mi.; motor vehicles licensed (Jan. 1, 1939): cars 3,399; trucks and buses 3,188; cycles 3,357; wireless receiving set licences (April 1, 1939) 140,099; telephone subscribers (April 1, 1939) 76,436.

Agriculture and Industry.—Production 1938 (in metric tons): oats 446,600; (1939) 450,300; rye 378,700; (1939) 429,700; barley 220,600; (1939) 209,000; wheat 191,000; (1939) 198,700; potatoes 1,751,400; flax and hemp (fibre) 21,500; beet sugar 33,300; wood pulp 41,200. Industry and labour: factories (1938) 5,977; employees (average 1938) 110,546; industrial production (1929=100) (average 1938) 174.5; (June 1939) 175.5; index of employment (1929=100) (average 1938) 144; applicants for work (average 1938) 2,164; (Aug. 31, 1939) 446.

Lavelle, Michael J. (1856-1939), American priest, rector of St. Patrick's cathedral in New York city for 52 years, was born in New York city on May 30 and was educated at Manhattan college and St. Joseph's seminary, Troy, New York. He was ordained to the priesthood in 1879 and named

rector of the cathedral in 1886. In 1902 he was appointed vicar general of New York and the next year domestic prelate to Pope Pius X. He died at New York city on October 17.

Law (Case). The following cases, decided during 1939, have been selected to represent the crystallization of the more important rules of American law.

Agriculture.—Emphasizing the trend toward governmental regulation, upheld by the Supreme Court, several tribunals have sustained agricultural legislation which, heretofore, would have been deemed illegal because of its price-fixing features. This phase of control is applicable to intrastate handlers of milk on the theory that the distribution of a substantial amount of milk in an area outside of the regulation would seriously interfere with and adversely affect the regulation of the interstate handling of milk undertaken by the Secretary of Agriculture (*U.S. v. Andrews*, U.S.D.C., D. Mass., January 18). Similarly validated were the Marketing Agreement Act of 1937 (*U.S. v. Krechting*, U.S.D.C., S. Ohio, February 17), and a California statute providing for such regulation (*In re Willing*, January 18). But Florida's so-called Grower's Cost Guarantee Law of 1935 providing for the regulation of marketing of citrus fruit produced in the State is unconstitutional insofar as it provides for the establishment of the cost of production as the minimum price at which the fruit may be sold: such regulation being arbitrary and in violation of the due process clause of the constitution (*Lakeland Highlands Canning Co., Inc. v. Mayo*, U.S.D.C., S. Florida—three judge court—May 3).

Aliens.—The influx of refugees into the country has given rise to a number of problems pertaining to the rights of aliens. Outstanding are the right to come in under the Immigration Act of 1937 and liability to deportation.

Although under normal circumstances willful false swearing would involve moral turpitude, in the opinion of the attorney-general (Dec. 31, 1938, released Jan. 9, 1939) such offence did not bar a German refugee who was convicted by a German court of knowingly making a false statement in a report required by the German Real Property Law (*Opinion No. 59*—vol. 39 of Attorney-General). A native born citizen of the United States did not lose her citizenship because of her removal during minority to Sweden where her parents resumed their citizenship in that country. Such native, having returned to the United States within a reasonable time after attaining her majority with intention to remain and maintain her citizenship here, continues to enjoy that citizenship unless she was deprived of it through operation of a treaty, or congressional enactment, or by voluntary action (*Perkins v. Elg*; *Elg v. Perkins*, nos. 454-5, May 29). The Circuit Court of Appeals decided in a novel case that the revocation of a visa after the embarkation of an alien is unauthorized although it is based on fraud in obtaining the visa. The Consul who issued the passport relied on a misrepresentation that the alien was not accountable. The alien denied such facts on his arrival. The court held that he could not be excluded solely on the ground that the visa had been revoked but is entitled to a hearing on the merits before a board of special inquiry on the question whether he obtained the visa by fraud (*Strachey, U.S. ex rel v. Reimer*, January 23).

Anti-Trust.—Under the anti-trust law, treble damages are allowed the injured plaintiff in a civil suit. Simultaneously with the Government's numerous anti-trust suits, many of these treble damage actions have been brought by private suitors. A novel aspect of this method of enforcement of the Sherman Act was involved in a case decided by the Circuit Court of Appeals for the second circuit. A distributor of a certain product, who had been selling it at a price lower than that fixed in a price maintenance agreement, and as a result had been deprived of his supply of the

product, was permitted to sue the producer and other distributors for treble damages even though he originally was a party to the combination to restrain trade in violation of an anti-trust act by a price agreement (*Connecticut Importing Co. v. Frankfort Distilleries, Inc.*, January 9). The major anti-trust activities, however, have been suits by the Department of Justice and the attorney-general's office to curb such practices by compelling industries to enter consent decrees under which they were enjoined from the continuance of such practices. This so-called method of "potential" anti-trust actions has been deemed more effective and far-reaching than actual indictments. Wherever a governmental investigation is undertaken, illegal practices, it is noted by the assistant attorney-general, have become less, and profiteering eliminated. The turn in anti-trust suits has been away from injunctions and more towards the criminal action. The oil companies indicted in *U.S. v. Socony Oil Co., Inc.* (C.C.A. 7, July 27), General Motors Corp. (*U.S. v. General Motors Corp.*, U.S.D.C., N.D. Indiana, November 15), and *U.S. v. Aluminum Co. of America* (U.S.D.C., S. N.Y., November 1) have brought to a close a series of actions in which the Government has been highly successful. In the General Motors case the corporation (as in oil and aluminium) was convicted of conspiring to violate the anti-trust laws, but all the individuals in that case were acquitted of that charge.

Constitutional Law.—A statute providing for flag salute by pupils of public schools is constitutional and does not violate the due process clause of the 14th Amendment as to pupils who sincerely and honestly believe, in accordance with the doctrines of their religious sect, that such salute is a form of idolatry (*Johnson v. Town of Deerfield*, U.S.D.C., D. Mass.—three judge court—January 4). A New York statute making the presence in an automobile of any weapon presumptive evidence that all persons in the automobile at the time the weapon was found therein are guilty of illegal possession of the weapon is constitutional. Such statute is not unlike placing a similar burden on others discovered in the possession of stolen goods, burglar's tools, proceeds of larceny, intoxicating liquors, etc. (*N.Y. v. Burt*, N.Y.C. Ct., Queens County, March 18). The New Jersey Gangster Act provides that "any person not engaged in lawful occupation, known to be a member of any gang consisting of two or more persons who has been convicted at least three times of being a disorderly person, or who has been convicted of any crime in this or any other State is declared to be a gangster." This act was declared unconstitutional because the terms of the statute "are so vague, indefinite, and uncertain as to deny the due process of law guaranteed by the 14th Amendment of the Constitution" (*Lanzetta, etc., et al. v. State of New Jersey*, No. 30, March 27). A statute subjecting all income of domestic corporations doing business within and without a State to a tax is unconstitutional in view of the fact that domestic corporations doing business in other States are exempt (*Mc Carroll v. Gregory-Robinson-Speas, Inc.*, Ark. Sup. Ct., April 11).

Domestic Relations.—The attitude toward the migratory divorce, particularly of Mexican origin, is reflected in the recent decision of the U.S. Court of Appeals, District of Columbia, which refused to recognize a Mexican divorce despite the fact that both husband and wife joined in procuring it (apparently by mail order). Since neither party was domiciled in Mexico nor personally present there, there was no basis for the Mexican court to exercise any jurisdiction (*Garman v. Garman*, January 30). The Ohio Court of Appeals has ruled that a husband whose wife was employed in a gainful occupation although he was able to provide her with a suitable home, was not entitled to divorce on the ground of gross neglect of duty. Nor was the court impressed by his claim that business worries incident to her work made her irritable, unpleasant, and quarrelsome (*Winnard v. Winnard*, November 8). The Oregon Supreme Court takes a more liberal position, allowing

"A SLIGHT DIFFERENCE OF OPINION" concerning the performance of the National Labor Relations Board existed in 1939, notes Sykes of *The Boston Transcript*

divorce where the wife's frequent statements to her husband that she had ceased to care for him and did not wish to live with him were deemed "personal indignities" rendering the husband's life "burdensome" within the meaning of the Oregon statutes (*Neely v. Neely*, October 3). A novel guardianship statute, providing that sexually irresponsible persons are to be held subject to commitment and treatment in guardianship proceedings has been upheld by the Minnesota Supreme Court. Persons having a "psychopathic personality" are proper subjects for guardianship (*Pearson, State ex rel.*, Probate Court, June 30). Under the common law, husband and wife could not sue each other on the theory of union of personalities. With the coming of women suffrage and the recognition of equality, modern statutes have been granting them the same rights enjoyed by males. Accordingly, the U.S. Court of Appeals for the District of Columbia has allowed a wife to maintain an action for defamation against her husband and other persons who had conspired with him falsely to charge her with adultery (*Ewald v. Lane*, March 13).

Housing.—Indiana and California have upheld State housing legislation designed to make available to local housing authorities Federal aid provided for by the U.S. Housing Act. The unanimity with which State courts have upheld such legislation is significant in view of the constitutional objections which have been invoked in attacking such statutes. It is now clearly established, at least under State constitutions, that slum clearance and low-rent housing projects are in furtherance of a public purpose although the immediate benefit is limited to a particular group—persons of low income (*Edwards v. Housing Authority of City of Muncie, Indiana*, Sup. Court of Indiana, March 13; *Housing Authority of County of Los Angeles v. Dockweiler*, California Sup. Ct., October 11).

Insurance.—A commercial aeroplane passenger killed in a plane crash did not die as a result of participation in aviation or aeronautics within the meaning of an excepting clause in a life insur-

ance policy (*Massachusetts Protective Assn., Inc. v. Bayersdorfer*, C.C.A. 6, June 28). The Supreme Court of Minnesota holds that a person suffering from diabetes is entitled to disability benefits under a life policy even if he refuse to submit to medical treatment which would improve his health to the extent that he would be able to work (*Miller v. Mutual Life Insurance Co. of N.Y.*, November 3). The lay-off of a factory worker because of lack of work does not in the opinion of the Wisconsin Supreme Court, affect the continuity of his employment within the meaning of a group insurance policy even though the lay-off continues for six months (*Garusky v. Metropolitan Life Insurance Co.*, October 10). The double indemnity clause of a life insurance policy insuring against injury and death "hy the collapse of the outer walls or burning of a building if the insured is therein at the time of the collapse or commencement of the fire," was applicable to the death of the insured as a result of burning of an automobile trailer, the trailer being a "building" within the meaning of the policy (*Aird v. Aetna Life Insurance Co.*, U.S.D.C., W. Texas, March 6).

Labour.—Labour has profited and lost by the divergent tendencies expressed in legislative, executive and judicial circles. An outstanding development in this heavily litigated field has been the official pronouncement by the attorney-general's office that labour unions are subject to criminal prosecutions under the anti-trust laws whenever the objective of a strike, boycott, or other concerted activity has no reasonable connection with a legitimate labour purpose such as wages, hours, safety, or collective bargaining. In the significant case of *Leader v. Apex Hosiery Co.* (C.C.A. 3, November 29) the Third Circuit Court of Appeals held that a sit-down strike in the manufacturing plant of the company did not restrain interstate commerce within the meaning of the statute although the company buys all of its raw materials and ships 80% of its completed merchandise in interstate commerce, and though manufacturing operations were disrupted for a period of six weeks. On the other hand, the court for the Seventh Circuit, held that picketing of retail milk stores in the city of Chicago constituted restraint of interstate commerce in view of the fact that the flow of interstate commerce in milk was retarded (*Lake Valley Farm Products, Inc. v. Milk Wagon Drivers' Union*, C.C.A. 7, November 29).

The widening application of the Labor Act has radically altered former concepts of interstate commerce. Although for the first time in its history of almost five years the Labor Board formally dismissed a proceeding for lack of jurisdiction. It found that commerce is not affected by (1) Interstate shipment of \$15,000 worth of goods which is three-tenths of 1% of the company's total sales (*In re San Diego Ice & Cold Storage Co.*, NLRB nos. C-436, R-499, November 9); (2) Operations of a taxicab company which receives two-tenths of 1% of its revenues from interstate business (*In re Yellow Cab & Baggage Co.*, NLRB no. C-1098, November 19).

In determining whether labour has been permitted to bargain collectively without molestation from employers, the Board has continued its policy of scrutinizing every arrangement and concession by the employer to detect domination, coercion, or persuasion. Where the bargaining was originated by the employer's chief officers, the Circuit Court held the Board justified in finding domination (*Virginia Ferry Co. v. NLRB*, C.C.A. 4, January 9). Courts have been willing to uphold the board even though there was small substantial interference with the employee organization (*Cudahy Packing Co. v. NLRB*, C.C.A. 8, March 27). Where, however, evidence did not show "wilful refusal" to negotiate with a representative as to wages, hours, and conditions of employment, the board's order was set aside (*Globe Cotton Mills v. NLRB*, C.C.A. 5, March 30). But an employer's refusal to co-operate in establishing a union's majority status was held by the board to consti-

tute a refusal to bargain collectively (*In re Stehli & Co., Inc.*, NLRB no. C-463, March 30). Even though a strike be clearly premature, an employer's refusal to bargain collectively is held to prolong it and his failure to reinstate strikers was a discrimination in violation of the Wagner Act (*In re Bennett-Hubbard Candy Co.*, NLRB no. C-609, March 13).

The Wagner Act does not prevent an employer from discriminating in hiring (*NLRB v. National Casket Corp.*, C.C.A. 2, December 11). But the fear that union employees will engage in a sit-down strike justified an employer in replacing the employees, where under the circumstances the employer's suspicion was well founded (*In re Calmer Steamship Corp.*, NLRB no. C-417-26, C-428, December 1).

The reaction to labour's growing power, its insubordination and the immunities it enjoys by virtue of the anti-injunction statutes stemming from the Norris-La Guardia Act back in 1932 have given rise to a flood of anti-picketing ordinances and statutes which have, in the main, been upheld (*Swing v. A.F. of L.*, Ill. Sup. Ct., June 19). Where, however, anti-picketing ordinances conflict with the State anti-injunction act obviously the latter will prevail. Under such a statute in the State of Washington an injunction restraining the doing of certain acts which involve a labour dispute may not be granted (*City of Yakima v. Gorham*, September 27).

In determining whether to order reinstatement, the board is governed by the *Fansteel* case (see SUPREME COURT OF THE UNITED STATES), i.e. the employee must not have been guilty of illegal acts (*Republic Steel Corp. v. NLRB*, C.C.A. 3, November 8).

In the matter of judicial review, the board has been censured by many courts for its findings and recourse to "background evidence" when in lack of more convincing proof that an employer has been guilty of unfair labour practices. Yet judicial review of the board's decisions, ruled the Circuit Court of Appeals and affirmed by the U.S. Supreme Court (see SUPREME COURT OF THE UNITED STATES), will only be allowed from a final order. The effect of this ruling is to grant absolute power over an important segment of labour board decisions, namely, over matters of certification of representatives and the conduct of elections in determining the appropriate unit of bargaining (*A.F. of L. v. NLRB*, U.S. Ct. Appeals, D.C., February 27).

Securities.—A buyer of securities who was not furnished a prospectus may bring a civil action under the Securities Act of 1933 only if the particular sale was made through the mails or in interstate commerce (*Farrel v. Reynolds*, N.Y. Sup. Ct., February 24). The United States Court of Appeals for the District of Columbia held that a registration statement filed under the Securities Act of 1933 could not be withdrawn without the consent of the Commission after the statement had become effective and the Commission had instituted stop-order proceedings (*Resources Corp. International v. Securities & Exchange Commission*, February 27). Reports of National bank examiners to the comptroller of the currency may be furnished by the secretary of the Treasury to the SEC, for its use in connection with its inquiry into the financial condition of a bank whose stock is owned by a holding company being investigated by the Commission on charges of fraudulent statements in securities registration. Such reports, however, the court held, may not be introduced in evidence by the Commission at its hearings or otherwise made public (*Bank of America National Trust and Savings Association v. Douglas*, U.S.D.C., D.C., January 31).

Social Security.—A foundation created by a will has been held exempt from payment of social security taxes although it has granted donations of trust funds to employees and invested trust funds in a housing project (*Linderman v. Discoll*, U.S.D.C., W.Pa., February 15). An employer-employee relationship exists for social

security purposes in the case of contracts between a manufacturing company and truck drivers (*Jack & Jill, Inc. v. Tone*, Conn. Sup. Ct. of Errors, December 6); physicians devoting full time in clinic (S.S.T. 363, May 8); sales clerks trained by employee service company (S.S.T. 377, October 16); and students of high school placed in vocational training (S.S.T. 356, March 20). Soliciting life insurance agents are not employees within the meaning of Connecticut Unemployment Compensation Act (*Northwestern Mutual Life Insurance Co. v. Tone*, Conn. Sup. Ct. of Errors, March 1, in which holding 29 States concur). A contrary view is maintained by the Colorado Supreme Court (*Equitable Life Insurance Co. of Iowa v. Industrial Commission*, October 16).

Torts.—Formerly the ultimate consumer had no recourse against a manufacturer for negligence in the production of a commodity because there was no privity of contract between the parties. Recent trends in the field of tort law point in the direction of allowing recovery. Accordingly, a cigarette manufacturer was held liable under California law for personal injuries suffered in smoking a cigarette in an action based on negligence in the fabrication of the cigarette (*Lape v. Liggett & Myers Tobacco Co.*, Cal. Sup. Ct., January 17). An automobile driver whose negligence caused a collision was held liable for injuries suffered by a bystander from a flying spare tire even though the driver could not have anticipated such injury. It is sufficient to hold him liable, said the court, if he should have anticipated an injury (*Sullivan v. Flores*, Texas Sup. Ct., October 18). An automobile passenger was held guilty of contributory negligence in asking the driver a question, thereby distracting his attention while the car was approaching a curve (*Brandau, State to use of, etc. v. Brandau*, Md. Ct. of App., May 17). Although the conventional distinction in the law of torts between mental and physical harm still plays a significant rôle (recovery being allowed for physical harm and generally denied for mental) the tendency of the law to ignore "mental" harm is diminishing. The law has long given redress in some circumstances for intended mental harm without attendant physical consequences. A collection agency which has been employed to collect an alleged debt may be held liable to the debtor for injuries suffered as a result of statements in letters causing him mental anguish and impairing his health (*Clark v. Associated Retail Credit Men of Washington, D.C., Inc.*, D.C., April 10, 1939). The Ohio Supreme Court denied recovery to a bus passenger who became ill as the result of fright when detained for a period of 30 seconds to two minutes between electrically operated folding doors, where the fright was not accompanied by contemporaneous physical injuries (*Davis v. The Cleveland Railway Co.*, Ohio Sup. Ct., May 17).

Trade Regulation.—The most essential issue in this field of control has been the acrimonious battle between independents and chains and independents and price-cutters. The battle against the chains was on the whole unsuccessful in 1939. Pennsylvania (*American Stores Co. v. Boardman*, Pa. Sup. Ct., June 19), Kentucky (*Great Atlantic & Pacific Tea Co. v. Kentucky Tax Commission*, Kentucky Court of Appeals, March 21), Georgia (*Southern Groceries & Co., Inc. v. City Council of Augusta, Ga.*, Superior Court, October 21; *Great Atlantic & Pacific Tea Co. v. City of Columbia*, Georgia Supreme Court, November 16), declared their chain taxes unconstitutional, insisting generally that the principle of equality and uniformity in taxation "is one of the cornerstones of our Constitution" and that the classification singling out chain stores for a heavy tax was arbitrary, unreasonable, and confiscatory. Colorado Supreme Court, on the other hand, extended to "agency" stores the chain store characteristic and held them subject to the multiple store licence fee (*Bedford v. Gamble Skogmo Inc.*, May 29).

The brokerage provision of the Robinson-Patman Act prohibit-

ing payment where no such service was genuinely rendered (*Oliver Brothers v. F.T.C.*, 102 F [2d] 263, March 25; *Great Atlantic & Pacific Tea Co. v. F.T.C.*, 106 F [2d] 667, September 22), is upheld, since the Supreme Court has refused to review the Circuit Courts' decisions.

The Fair Trade laws, enacted to prohibit predatory price-cutting on trade-marked commodities in free and open competition by permitting the manufacturer to determine his minimum resale price, has received wide judicial approval. North Carolina upheld the constitutionality of its act (*Lilly & Co. v. Saunders*, N.C. Sup. Ct., September 27). The New York Court of Appeals has held that a non-signatory to a Fair Trade contract was bound by the contract as though he were a party to it, if he had knowledge of its existence (*Porchester Wine & Liquor Co. v. Miller*, July 11). Florida, on the other hand, has declared its Fair Trade Act unconstitutional insofar as it was held to be binding on dealers who have not signed such contract although they had notice thereof. Such provision, the court held, was not within the scope of the title of the Act as required by the State constitution (*Bristol-Myers, Inc. v. Webb's Cnt Rate Drug Co., Inc.*, Sup. Ct., April 14).

Loss leader laws prohibiting sales below cost have not been as successful in courts as have been Fair Trade laws. The former, savouring too much of price fixing, have been declared unconstitutional and unworkable (Michigan, Maryland, New Jersey).

Under the Wheeler-Lea Amendment, the Federal Trade Commission has intensified its campaign to eliminate unfair competition (*In re Laing, Harr and Chamberlain, Inc.*, F.T.C. No. 3725, November 5), receiving added encouragement by declaration of the act's constitutionality (*Ostler Candy Co. v. F.T.C.*, C.C.A. 10, August 30).

The Bituminous Coal Act of 1937, insofar as it provides for price fixing, was held a constitutional exercise of the commerce power of Congress (*City of Atlanta v. National Bituminous Coal Comm.*, U.S.D.C., Dist. Col., February 15). Furthermore, the National Bituminous Coal Commission in a proceeding under this law, to establish minimum prices and marketing rules and regulations, has the power (sect. 10 [a]) to make available for inspection and introduction in evidence the reports concerning costs which have been made by coal producers who are members of the Bituminous Coal Code (*Utah Fuel Co. et al v. National Bituminous Coal Commission et al*, No. 528, January 30). (See also BANKRUPTCY.)

Lead. The nine chief lead-producing countries, with outputs in excess of 50,000 tons, supply nearly 90% of the world total, the remaining 10% being scattered among a large number of minor producers, only five of which, France, Italy, Poland, the United Kingdom, and Japan, produce amounts in excess of 10,000 tons. World production declined 33% from 1929 to 1932, and in 1937 had recovered to 97% of the former high; the 1938

World Production of Lead
(In thousands of metric tons)

	1929	1932	1936	1937	1938
Australia	177.3	189.2	200.6	234.4	235.7
Belgium	62.2	61.5	65.1	88.0	90.5
Canada	148.0	116.1	173.8	186.4	185.7
Germany	97.9	95.2	139.0	162.4	171.7
Burma	81.5	72.3	74.3	78.9	81.4
Mexico	248.8	130.3	218.3	231.2	242.7
Spain	133.3	109.8	46.6	30.0	36.0
U.S.S.R.	6.2	18.7	50.8	55.0	69.0
United States	624.2	251.7	362.9	426.3	344.4
World Total	1,756.8	1,179.7	1,493.6	1,719.6	1,705.0
Ex. U.S.	1,132.6	928.0	1,130.7	1,293.3	1,360.6

total declined by 1%, to 1,705,000 tons, while preliminary estimates for 1939 indicate some increase.

United States production dropped 19% in 1938, to 344,400 metric tons, but rose again in 1939 to 430,000 tons, an increase of 18%, which brought the output back to the 1937 level. Canada and Burma had little change in 1938, but dropped slightly in 1939. Germany had a small increase in 1938 and apparently again in 1939. Mexico had a small increase in 1938, but dropped sharply in 1939. All of the figures quoted for 1939 are estimates based on figures for from seven to ten months' operation, and therefore are only approximate. Since the outbreak of war on September 1, practically no information is available on European operations.

Consumption of lead in the United States is practically independent of both imports and exports, each of which amounts to less than 1% of the total. The Australian, Belgian, Canadian, Indian, Mexican and Spanish outputs are largely exported, there being a large surplus over local consumption demands; German production, although large, must be supplemented by imports, which amount to 40-50% of the production, which is itself partly from imported ores. The United Kingdom has only a small home output, and depends on imports, largely from Empire sources. (See also METALLURGY: *Lead*.) (G. A. Ro.)

League of Nations. Politically, in 1939, the League's role was that of uneasy spectator until December. Czecho-Slovakia and Memel were annexed by Germany and Albania by Italy. But the cases of the victims were not laid before the League. Nor was the League able to give China anything like the effective help which she repeatedly asked for against the aggression of Japan. The causes for this political weakness and inactivity lay in the past. Not a little was due to deliberate pressing and propaganda on the part of the axis States, who had been living openly in defiance of the League.

When the war broke out the principle that the League was concerned was recognized to the extent that belligerents notified the League of their declarations of war and the reasons therefor, while the neutrals notified their neutrality. No member of the League, not even Poland, requested intervention.

For some time the League had recognized the possibility of the outbreak of war. After the Czecho-Slovak crisis of Sept. 1938 plans were devised for constitutional adjustments within the League. An emergency committee with plenary powers was formed out of the supervisory commission, the keeper of the League's purse, together with the secretary general, M. Avenol, the director of the International Labour Organization, Mr. Winant (United States), former premier Colijn of Holland and M. Carton de Wiart of Belgium. A similar emergency committee was formed for the International Labour Organization. When war came, these committees at the request of some 40 states including non-members of the League, *i.e.* the United States and Brazil, determined that the League should carry on above all in neutral, non-controversial, technical matters, and should ensure that its organizations should be fully prepared for handling, as they had done successfully after the World War (1914-18), any of the special activities which war allows or demands. The League deputy-secretary-general, Sean Lester, summed up the League's position, in a broadcast to New York on Oct. 21, 1939, thus: "Three fields of activity lie before the League today; they are readaptation of its work to meet the needs of the present crisis, preparation of material for assisting the settlement which will eventually come out of the war, and examination of the economic conditions to be faced in the problem of reconstruction."

Preoccupation with technical problems was, however, interrupted by Finland's appeal to the League under Articles 11 and 15 of the Covenant, against Soviet Russia's aggression on December

2. Hitherto it had been deemed politically inadvisable for a Council or Assembly to be summoned—not least out of regard for neutrals with powerful neighbours who were hostile to the League. Now Council and Assembly met to deal with Finland's appeal. Action taken by the League took a mere four days. The Council first considered the appeal, and passed it on to the new 20th Assembly, who appointed a special "Finn" committee to deal with the dispute. The Soviet Government was invited to submit the dispute for settlement, a formality met by refusal. The Assembly thereupon adopted a report setting forth the facts and containing a resolution which urgently appealed to every member of the League to give Finland all the material and humanitarian help possible, the technical services of the League to be used in its organization; it stated that Soviet Russia had "by its own action placed itself outside the Covenant," and asked the Council to consider "what consequences should follow from this situation." The Council on the same day, December 14, repeated the Assembly's condemnation of Russia's actions. "It follows," concluded the Council's resolution, "that the Union of Soviet Socialist Republics is no longer a member of the League." The League's action, whatever the final consequences, was of great importance. Forty-three nations turned to the only existing machinery for the peaceful settlement of disputes and for action against a state which refused to use the processes prescribed for such settlement. The League pronounced a severe moral verdict against the aggressor state, expelled it from membership, and organized help for the victim.

The International Labour Organization showed that its tripartite character, uniting Governments, employers and workers for a common aim, is capable of facing social problems in a time of crisis as well as in normal times. Owing to the condition of "near war," the annual conference in June abandoned attempts to realize the 40-hour week immediately. But draft conventions and recommendations were adopted on road transport, contracts of employment to indigenous workers, and protection of migrant workers.

In November, a second conference dealing with South American labour problems was held at Havana. A message from President Roosevelt strongly urged that the war should not be allowed to lessen the work of the International Labour Organization. At Geneva the Organization concentrated on collection of information to enable it to answer questions on social problems arising out of the war. (See also INTERNATIONAL LABOUR ORGANIZATION.)

Determination to adapt its technical machinery to changing conditions led the League to set up an expert committee under Mr. Bruce. Its report in August proposed to set up a central committee of 24 to co-ordinate all the League's technical work, *i.e.* social and economic questions, which really concern the whole world.

Many League organizations worked steadily throughout 1939. The routine work of the Health Organization persisted with little change. At a full session in November the Health Committee prepared for concerted action with the Balkan states for prevention of diseases caused by war. The Mandates Commission held two sessions. It declared that the British Government's *White Paper* of May on the future of Palestine was not in accord with the accepted interpretation of the mandate. The League Council has still to pronounce on this view. The Opium Central Board and Supervisory Committee laid down the world's legitimate need of drugs (162 countries out of 177 sent information); this work was officially described by the U.S.A. as of the highest importance, notably in time of war.

The League budget—Russia's expulsion involved a serious loss—was pared to the bone, less than £1,000,000, which was over 34% less than that for 1939, and the equivalent of some four days of Switzerland's mobilization costs. (See also PACIFISM; REFUGEES.) (M. Fe.)

Leather. Stretchable leather, controlled by an elastic backing, which was introduced in 1938, has been further developed and is meeting with an increased demand. Among the newer developments are processes for making shoe lining and other leathers sanitary and antiseptic to prevent the growth of bacteria and thus promote cleanliness and elimination of offensive effects from foot perspiration.

Methods by which leather affected by poison gases may be decontaminated, have been devised in England. Nearly all types of leather may be freed from effects of mustard gas by immersion for six hours in water at 120° to 130°F. Alum tanned leather, however, will not stand this treatment.

In seeking factors that might cause failure of white shoe leathers, studies have been continued to include the effect of various constituents of shoe finishes, polishes and cleaners upon the tensile strength and stretch of the leather. Sulphonated oils, certain gums, and glycerine tend to maintain a higher moisture content in the leather and, consequently, increase its strength and stretch. Materials such as ethyl alcohol and carbon tetrachloride that tend to dry out the leather and remove fats, cause an especially serious lowering of the strength and stretch of the leather. Shellac cut with borax decreases both strength and stretch. Turpentine, ethyl acetate and petroleum naphtha increase tensile strength and decrease stretch.

A study of currying leather has shown that the gummy spew which sometimes forms on vegetable tanned leather is due to oxidation and gelation of the cod oil present. This formation is

accelerated by the presence of catalytically active metals, a high content of oil, and exposure to light and heat. It is prevented by water solubles in the leather and by free fatty acids either in the currying oils and greases, or formed afterwards. Spewing also can be prevented by the addition of anti-oxygens to the cod oil.

In continuation of studies to develop physical tests for measuring the properties of leather, a comparison has been made of five machines of different design proposed for determining the resistance of sole leather to abrasion. Eighteen leathers were used and all machines showed a general tendency to rate them in a similar order. Choice of abrasive had a greater effect on the results than the construction of the machine, and a machine measuring abrasion only appears to give as good an indication of the wear of the leather as one that attempts to emulate action of the foot.

The measure of the stretching of calfskin leather through an adaptation of the Mullen tester, long used for determining the bursting strength of paper, has been proposed as an index of quality that might be particularly significant in predicting the behaviour of leather in lasting and other operations in the shoe factory. Splitting a leather lowers resistance to stretch far more than can be accounted for by the decrease in thickness. Grain cracks occur either because of low resistance to stretching or a low extensibility of the grain. An inelastic grain can result from overloading with tanning, dyeing, or finishing materials.

As a result of the continual search for raw materials by those countries facing a shortage of staple hides and skins, Japan is reported to have developed a simple method for tanning chicken skins. The area of each skin approximates 0.7 of a square foot. The leather is said to be suitable for handbags and women's shoes. The commercial feasibility of using these skins is doubtful, however, since they command in Japan for the preparation of several popular dishes as high a price as the meat. Whale hides are also being tanned. Their appeal lies in the large supply from a single hide. It is claimed that the hide of a small whale yields as much leather as ten cattlehides, whereas that of a large whale is equivalent to 100 cattlehides. Italy, like Germany and Japan, has also turned its attention to the tanning of fishskins, with the newly established industry located at Milan. Skins of the dentex, carp, grayling, ray and eel, and even of the imported dried codfish, are used.

A new process and product has been developed in Australia for making carpets of sheepskins. The skins are tanned and dyed with the wool on and cut when necessary to provide patterns in various colours. The skin side is provided with a special covering and bound so that no pad is required.

The finished product is said to resemble a deep pile Chinese carpet.

Among the novelties in leather are ash trays, humidors and serving trays made from chrome leather thoroughly impregnated with a wax and then pressed into shape and finished.

The leading export countries in 1938 according to dollar value at the average annual exchange rate for the year were: United Kingdom \$16,113,000; United States \$12,061,000; Germany \$10,510,000; and France \$9,951,000. (R. W. F.; J. G. Sc.)

Lederer, Emil (1882-1939), German economist, was born in Pilsen, Bohemia, on August 22. He received his doctorate in law at the University of Vienna and his doctorate in political science at the University of Munich. In 1912, after two years of co-editorship with Werner Sombart of a sociological journal he became a lecturer at the University of Heidelberg. His *White Collar Workers in the Modern Economy* (1912) was one of the first books to call attention to the peculiar economic problems of middle-class office workers. His chief work was *Principles of Economic Theory*, published in 1922. He remained as full professor of economics at Heidelberg until 1923, when he went to the University of Tokyo as visiting professor for two years. His advocacy of a modified Marxism gained him the enmity of the Nazis, who expelled him from Germany in 1933. He went to the United States, where he helped his friend, Dr. Alvin Johnson, organize the Graduate Faculty of the New School for Social Research at Yale university. Lederer became first dean of this "university in exile," and served for two years. In the United States he published *Japan in Transition*, written in collaboration with his wife. He died at New York city on May 29.

Legislation, Federal. From the customary output of abundant Congressional legislation, the following statutes have been selected for review because of their social significance.

Administrative Officers Act.—The Administrative Officers Act incorporated in the Court Reorganization Plan of 1937 substantially proposes to effect two broad beneficial objectives advocated by the Bench and Bar. Specifically they are: (1) to place the business management of Federal courts under the judicial rather than the executive branch of the Government; (2) to expedite the administration of justice by providing for a full time officer to compile statistics relative to Federal court dockets and make recommendations based thereon to the end that the courts may keep abreast of their business. Formerly, the fiscal management of the entire Federal judicial system lay within the jurisdiction of the Department of Justice. Requests for salary increases for clerks and other court employees, for added appropriations, for library and office equipment, and other financial details, had to be submitted to the Attorney General. The budget for the courts was prepared by the Administrative Assistant to the Attorney General, the budget officer of the Department of Justice, and included in the general budget for the Department of Justice. The entire judicial system as a result becomes an integrated whole, responsible only to itself and implemented with the means to achieve an effective administration. Under the Act, provision is made for expert reports on the condition of all Federal courts and the means given to the courts to eliminate conditions causing delay in the over-burdened courts. Operating through the judicial councils of each circuit, the needs of the courts will be demonstrated by the statistics and findings of the Director in a quarterly report which will be submitted for their scrutiny and for such action as they see fit to take thereon. An essential part of the new provision requires the senior circuit judge in each circuit to convene a judicial council composed of the circuit judges at least bi-annually. To this council is submitted the quarterly reports of the administrative officer predicated upon his examination of the dockets of the courts in their circuit together with information as to the needs of the various courts, as required in the Act. On the basis of this report, the council is empowered to make recommendations to the district court judges. In the past, no authority was vested in any body to make recommendations to the district court judges and because of this autonomy, in certain instances, unfavourable conditions had to be tolerated. Under the new act they must now heed the admonition of the circuit council.

Neutrality Act of 1939.—In an effort to preserve its neutrality in wars between foreign states and to avoid involvement therein, Congress by this new act, voluntarily imposes upon its nationals by domestic legislation certain restrictions by which, however, the United States waives none of its own rights or privileges, or those of any of its nationals, under international law, and expressly reserves all the rights and privileges to which it and its nationals are entitled under the law of nations. Whenever the President, or the Congress by concurrent resolution, finds that there exists a state of war between foreign states, and that it is necessary to promote the security or preserve the peace of the United States or to protect the lives of citizens of the United States, the President shall issue a proclamation naming the states involved; and he shall, from time to time, by proclamation, name other states as and when they may become involved in the war and revoke such proclamation on the cessation of hostilities. Upon the issuance of such proclamation by the President, no American vessel may carry any passengers, articles, or materials to any state named in such proclamation. Violation is punishable by fine of not more than \$50,000, imprisonment for not more than five years, or both. Such proclamation shall bar any export or trans-

port, or attempted export or transport of any articles or materials (except copyrighted articles or materials) until all right, title and interest therein shall have been transferred to some foreign Government. The Act authorizes the President to define combat areas which, as defined, may be made to apply to surface vessels or aircraft or both. Here, too, violation is subject to a fine of not more than \$50,000 or imprisonment for not more than five years, or both.

After such Presidential proclamation, it shall be unlawful for any person within the United States to purchase, sell, or exchange bonds, securities, or other obligations of the Government of any state named in such proclamation, or of any political subdivision of any such state, or of any person acting for or on behalf of the Government of any such state or political subdivision thereof, issued after the date of such proclamation, or to make any loan or extend any credit (other than necessary credits accruing in connection with the transmission of telegraph, cable, wireless and telephone services) to any such Government, political subdivision, or person. These provisions shall also apply to the sale by any person within the United States to any person in a state named in any such proclamation of any articles or materials listed in a proclamation referred to in or issued under the authority of the law. For the conviction of any violation, the offender will be fined not more than \$50,000 or imprisoned for not more than five years, or both.

Following such Presidential proclamation, solicitation or receipt of any contribution for or on behalf of the Government of any state named is unlawful. Medical aid, food and clothing may, however, be solicited. If, in the President's judgment, forbidding a vessel's departure will serve to maintain peace between the United States and foreign states, or to protect the commercial interests of the United States and its citizens, or to promote the security or neutrality of the United States, he may require the owner, master, or person in command thereof, before departing from a port or from the jurisdiction of the United States, to give a bond to the United States with sufficient sureties, in such amount as he shall deem proper, conditioned that the vessel will not deliver the men, or any fuel, supplies, dispatches, information, or any part of the cargo, to any warship, tender, or supply ship of a state named in a proclamation issued under the authority of section 1 (a). Should the President find that special restrictions placed on the use of the ports and territorial waters of the United States by the submarines or armed merchant vessels of a foreign state will serve to maintain peace between the United States and foreign states, or to protect the commercial interests of the United States and its citizens, or to promote the security of the United States, he may ban such vessels, limit their navigation or revoke such instructions when the conditions which have caused him to issue his proclamation have ceased to exist.

The National Munitions Control Board.—The Neutrality Act of 1939 repealed the arms embargo clauses of the joint resolution of Aug. 31, 1935, as amended. It continued, however, the National Munitions Control Board by re-enacting it with only minor changes. The Neutrality Act of 1939 provides that reports are to be made to Congress by the Board on January 3 and July 3 of each year in lieu of the annual report which had been in effect. The registration fee which formerly was \$500 with provisions for refund in case business aggregate was smaller than \$50,000 annually is now fixed at \$100. The period of registration is five years and the fee for renewal is \$100 for each subsequent five-year period.

Every person who engages in the business of manufacturing, exporting, or importing any arms, ammunition, or implements of war must register with the Secretary of State. It is unlawful for any person to export, or attempt to export from the United States, or

to import, or attempt to import into the United States any arms, ammunition, or implements of war without first having submitted to the Secretary of State (through the Office of the Board) the name of the purchaser and the terms of sale and having obtained a licence therefor.

The President is hereby authorized to proclaim upon recommendation of the Board from time to time a list of articles which shall be considered arms, ammunition and implements of war for the purposes, but the proclamation numbered 2237, of May 1, 1937 (50 Stat. 1834), defining the term "arms, ammunition and implements of war" shall, until it is revoked, have full force and effect as if issued under the authority of this subsection. In addition to its supervision over the articles proclaimed "arms, ammunition and implements of war" the National Munitions Control Board has been charged with regulation and protection of the U.S. resources of tinplate scrap and helium. (See also NEUTRALITY.)

The Revenue Act of 1939.—The new legislation was designed to remove hindrances to business and some inequities in the Federal tax system. It replaces the undistributed profits tax with a flat 18% income tax levy on corporations; permits carryover to 1940 and 1941 of operating losses; provides that the capital stock valuation may be increased; permits corporations in unsound financial condition to buy in bonds without paying income tax on the excess of face value over the price paid; and eliminates the limitations on deduction of corporate capital losses. It also extends the period for filing claims for refund of AAA taxes; prohibits sale of information obtained from tax returns; and requires tax collectors to file notice of lien for it to be valid. The enactment of the Internal Revenue Code, on Feb. 10, 1939, did not change the law as it existed on that date. Consequently, the law applicable to 1939 returns is the same as the Revenue Act of 1938, applicable to 1938 returns, except for the changes made by the Revenue Act of 1939 and the Public Salary Tax Act of 1939. The most important changes effected by the Revenue Act of 1939 were undoubtedly the amendments made to the Internal Revenue Code. Practically every taxpayer will be affected by one or more of the amendments, some of which will apply to returns for the calendar year 1939 and fiscal years beginning in 1939 and ending in 1940, others will apply only for taxable years beginning after Dec. 31, 1939. The assumption of a transferor's liabilities by a transferee in certain non-taxable exchanges is no longer treated as money received by the transferor at the time of the exchange. That is, the gain on the exchange is not, as heretofore, recognized up to the amount of the liabilities so assumed. Any advantage to the transferor, over the prior rule, at the time of the exchange, is offset, however, by a requirement that the basis of the stock or securities received in the exchange must be decreased by the amount of the indebtedness assumed by the transferee. The Act further provides generally that if compensation for personal service rendered over a period of five or more years is received only in the year such services are completed, the income tax attributable to the compensation shall not be more than the aggregate of taxes which would have been paid had the compensation been received in equal portions in each of the years involved. Taxpayers, if they so elect, may treat as income amounts received as loans from the Commodity Credit Corporation. Where the loans are so treated the Act provides for proper adjustments of basis for computation of gain or loss on a subsequent sale of the commodities. It allows corporations a credit against the 19% tentative tax for amounts used to pay, not only an original indebtedness as was the case prior to amendment, but also a renewed indebtedness. In either case, however, the original indebtedness must have been in existence on Dec. 31, 1937 and evidenced by a bond, note, etc., which also must have been in existence on that date. A new exception

"SPEAKING OF HARMONY." Elderman's wry commentary in *The Washington Post* on co-operation between Democratic congressmen and the New Deal in 1939

is added to the general rule that a discharge or satisfaction of indebtedness for less than face amount results in income to the debtor. The exception relates to situations where a corporation in an unsound financial condition discharges its indebtedness, evidenced by a "security" for less than the amount received when the "security" was issued. "Security" means any bond, debenture, note or certificate, or other evidence of indebtedness, in existence on June 1, 1939. The commissioner has authority to require that an amount excluded from income shall be applied in reduction to the basis of any property held by the taxpayer. The limitation on deductions by insurance companies other than life or mutual companies, previously in force has been removed. The amendment extends to all taxpayers the privilege of valuing their inventories by the so-called last in, first out method, which was previously allowed only to tanners and producers and processors of non-ferrous metals.

Social Security Act Amendments.—The Social Security Act enacted in 1935 which established a Federal old-age insurance program offering the States Federal co-operation and financial assistance in nine Federal-State programs (unemployment insurance, aid to the needy aged, aid to the needy blind, aid to dependent children, services for maternal and child health, child welfare, treatment of crippled children, public health and vocational rehabilitation) has been amended following an intensive study of some three years by the Social Security Board.

The original Social Security Act did not take into account monthly benefits for survivors of insured individuals. Benefits to survivors were limited to lump-sum death payments. The amendments set up a system, however, whereby monthly insurance benefits with respect to qualified individuals who die after Dec. 31, 1939, are paid to widows, dependent children, or dependent parents who meet the stated requirements.

Death benefits in a lump sum equal to 3½% of the total accumu-

lated wages credited subsequent to Dec. 31, 1936, to an individual who dies before Jan. 1, 1940, will be paid, as heretofore, to his relatives or to his estate. The new law provides that after Jan. 1, 1940, lump-sum death benefits shall be paid only when the insured individual leaves no survivor entitled to survivor's benefits and, in that event, in an amount equal to six times the monthly primary insurance benefit. The payment is made to surviving relatives named in the statute or, if no such relatives survive, then to any person or persons "to the extent and in proportion that he or they shall be paid the expenses of burial of the deceased." Claim must be made for lump-sum death benefits by those entitled thereto within two years after the death of the insured individual.

The new law imposes the duty upon the board to make deductions from payments under Title II up to the full amount of the individual's monthly benefit or benefits for any month after retirement in which he rendered services for wages totalling \$15 or more. In like manner, violation of the retirement provision by an individual with respect to whose wages a benefit or benefits are payable also renders a wife's or child's insurance benefit subject to deduction.

Similarly deductions must be made (1) if a child under 18 and over 16 years of age failed for any month to attend school regularly and the board finds that attendance was feasible, or (2) if for any month "a widow entitled to a widow's current insurance benefit did not have in her care a child of her deceased husband entitled to receive a child's insurance benefit."

The amendments required that the board must be satisfied with the following provisions of the State law: (1) there must be a provision which limits the expenditure of Federal funds for the administration of the State law to only such purposes and in only such amounts as the board deems necessary for proper and efficient administration: (2) in addition to the provision formerly required, for the immediate payment to the Secretary of the Treasury of all money received in the State's unemployment fund, there must be a provision for the deduction from this payment to

the Secretary of the Treasury of refunds paid by the State both on account of erroneous payments into the fund, and in accordance with the provisions of Section 1606(b) of the Federal Unemployment Tax Act; (3) the requirement in the State law that all money which the State withdraws from its unemployment fund must be expended in the payment of unemployment compensation, exclusive of administration expenses, has been modified by excluding from such necessary expenditure all refunds made of sums erroneously paid and all refunds paid to instrumentalities of the United States or its employees in accordance with Section 1606(b) of the Federal Unemployment Tax Act; (4) should the State lose any of the money granted for the administration, or spend more than the board finds necessary in the proper administration of the State law, provision must be made in the State law for replacement of such funds by the State within a reasonable time; and (5) after Jan. 1, 1940, the State law must provide for the establishment and maintenance of personnel standards (other than selection, tenure of office, and compensation) on a merit basis, which are reasonably calculated to insure "full payment of unemployment compensation when due."

The amendments also increase the amount of Federal money available to match State expenditures for aid to the needy aged, the needy blind and dependent children. More Federal money is also appropriated for grants to the States to aid them in strengthening and extending their public health, vocational rehabilitation, material, and child welfare programs.

The Federal old-age insurance tax, based upon the wages of every individual engaged in covered employment, is levied, collected, and paid in addition to all other taxes upon his income. An important amendment changes the rate of the tax, which is imposed alike upon employer and employee, by continuing the 1% rate through the calendar years 1940, 1941 and 1942 on wages received by the worker after Dec. 31, 1936, thus repealing the former 1½% rate for those years. The 2% tax rate for the calendar years 1943, 1944 and 1945, and the 2½% rate for the years 1946, 1947 and 1948 remain unchanged. As under the former law, a rate of 3% is imposed after Dec. 31, 1948.

The amending act, recognizing the uncertainty of continued employment, simply provides that adjustments shall be made "with respect to any payment of remuneration" in accordance with authorized regulations. Special refund to employees and receipts for employees having more than one employer during the particular calendar year are provided for. Each employer must pay both the employer's and employee's tax on wages up to \$3,000 paid to and received by the employee in a particular year, irrespective of the number of employers involved.

Although the tax base remains the same, i.e., the first \$3,000 of wages received by an employee from an employer, the amendments have specifically excluded certain payments from the definition of wages. The exclusions are: (1) payment to or on behalf of an employee under any employer plan or system providing for (a) retirement benefits, or (b) sickness or accident disability benefits, or (c) medical and hospitalization expenses in connection with sickness or accident disability, or (d) payments on account of death. These exclusions comprehend premium payments made by an employer for insurance or annuities, or payments into a fund to provide for any such insurance payments, or to establish such a fund; (2) payment by an employer (without deduction from the employee's wages) of an employee's old-age insurance tax; (3) employee's contributions under a State unemployment insurance law; and (4) dismissal payments by an employer which are not required by law.

A new duty has been imposed upon the employer to furnish each employee with a written form or statement showing the wages paid by him to the employee during specified periods. The statement

"WHOA—COME BACK! FOUL BALL!" Cartoonist Herblock's estimation of the work accomplished by the first session of the 76th U. S. Congress in 1939

must also show the names of the employer and employee, the period covered by the statement, and the amount of the tax imposed with respect to wages paid.

Credits extended to taxpayers against Federal unemployment compensation taxes have been liberalized. Certification for credit (up to the 90% limitation) for contributions actually paid under a State law are no longer limited to cases in which the State provisions comply with the Federal law with respect to covered services performed in employment. The amendments also take cognizance of those instances in which the taxpayer makes payment of contributions to the wrong State. Upon payment to the State entitled to contributions, the date of the erroneous payment is controlling for the purpose of allowing credit against the tax for the amount of contributions actually paid. The amendments have extended and clarified the conditions under which additional credit allowances shall be made.

Beginning with the tax returns to be filed for the taxable year 1939, the maximum extension of time for the filing of such returns under such rules and regulations as the Commissioner for Internal Revenue with the approval of the Secretary of the Treasury may prescribe, has been extended from 60 to 90 days.

Specific provision is made that the full amount of the Federal tax may be collected from a bankrupt estate which has not complied with the conditions prescribed by the law for obtaining 90% credit against the tax.

Under the new law extensive changes are effected in coverage of employment. The definition of employment applicable to services rendered on and after Jan. 1, 1940, continues unchanged; the exemptions accorded to casual labour and to services per-

formed for religious, charitable, scientific, and educational organizations (with a slight clerical change in the text). The domestic service exemption is extended to include employees performing such service in local college clubs or local chapters of college fraternities or sororities. A new definition of "agricultural labour" is included which considerably broadens the scope of the exemption for such service by excluding numerous types of activities considered to be intimately related to farming operations, but which have heretofore constituted covered employment. A new exception, similar to that already contained in the Federal Unemployment Tax Act, exempts family employment. The coverage of employees of certain non-profit organizations exempt from income tax is narrowed. Services of certain students, of student nurses and internes, and of newsboys under 18 are also specifically excepted.

Several large groups of employees, formerly excluded from coverage will, effective Jan. 1, 1940, be included under the Federal Insurance Contribution Act (the new amendment) and will be eligible for benefits under Title II of the Social Security Act. A great portion of the group performing maritime services, formerly excepted, will be covered. Also covered will be employees performing services for Federal instrumentalities which are not wholly owned by the United States nor exempt from employment taxes by virtue of any other provision of law. This will mean the inclusion of national banks, member banks of the Federal Reserve System, Federal Savings and Loan Associations, and other similar organizations and their employees. With respect to instrumentalities of States, all such instrumentalities were formerly excluded without distinction between those exercising functions of a governmental nature and those exercising functions of a proprietary nature. Under the amendments, the exemption accorded to instrumentalities of States is more restricted and such instrumentalities are now exempt only if they are wholly owned by the State or, irrespective of ownership, they are constitutionally immune from tax.

Trust Indenture Act.—Losses to investors during the early years of the last decade have focused the attention of the entire nation upon the United States' financial structure and methods of operation. To reconstruct a system which would more fully be enabled to withstand cyclical depressions, the New Deal called into existence the Securities and Exchange Commission in 1933. By the Securities Act of that year, The Securities and Exchange Act of 1934, the Public Utility Holding Company Act of 1935 and the Chandler Bankruptcy Act of 1938 the SEC has been vested with power to compel full and fair disclosure to investors of all material facts pertaining to securities publicly offered for sale to prevent fraud and unfair practices in the securities markets, and to regulate the financial practices of holding company systems controlling gas and electric utilities. In investigating the work, activities, personnel and functions of protective and reorganization committees as part of its report recommending a revised bankruptcy act, the commission sponsored the Trust Indenture Act in an effort to remedy the alleged defects in this branch of securities. The act requires extensive changes in trust indentures with respect to qualification and disqualification of trustees, duties of trustees before and after default, covenants of obligors, provisions with respect to taking down of additional bonds, release of property, satisfaction and discharge of the indenture, reports to indenture security holders and ordinary creditor relationships between trustees and indenture obligors.

On and after Feb. 3, 1940 it will be unlawful (Sec. 306) to use the facilities of interstate commerce or the mails: (a) to sell or

PLEAS FOR AND AGAINST repeal of the arms embargo poured into the U.S. Senate's mail room as Congress prepared to debate the Neutrality bill; on Sept. 19, 1939, congressional mail reached an all-time record of 490,000 letters in a single day

offer to sell a note, bond, debenture or evidence of indebtedness, whether or not secured, a certificate or interest or participation in such note, bond, debenture or evidence of indebtedness or a guarantee thereof unless (i) issued under an indenture, (ii) one of the trustees under the indenture is an institutional trustee meeting the requirements of the Act, and unless the indenture security is either (r) exempt from registration under the Securities Act of 1933 (sec. 304), (2) registered under the Securities Act of 1933, or (3) issued under an indenture which has been qualified as provided in the new Act.

Civil liability for damages caused by reliance on mis-statements or omissions is imposed unless the person sued shall prove he acted in good faith and had no knowledge of the alleged mis-statement or omission. The information with respect to the person designated to act as trustee must be contained in a separate part of the registration statement or application and must be signed by such person (Secs. 305 and 307). Its provisions are applicable to the issuance on or after Feb. 3, 1940 of securities under existing indentures, but the commission is on application authorized to grant exemptions. The terms of the new Act are not applicable to securities issued in private placements and assuming the persons purchasing securities in private placements can prove the limited number to whom the securities were offered, the bona fide intention of the purchasers to buy for investment and not with a view to distribution, and that the initial transaction was not a public offering, the securities originally issued in private placement may be subsequently sold without registration even though the indenture does not comply with the new Act. Although indenture securities of a public utility company subject to the provisions of Section 6 and 7 of the Public Utility Act of 1935 are issued in a private placement the commission requires that the indenture conform to the provisions of the Trust Indenture Act of 1939. The Act materially limits the financial institutions eligible to act as indenture trustees and may require a trustee to share with indenture security holders certain payments made on obligations owing to the trustee in its individual capacity within a period of four months before and after the default under the indenture.

The provisions defining conflicting interests of trustees and the provisions setting forth the eligibility and qualification of trustees are to be exclusive and the commission is not authorized to set up additional qualifications under the Public Utility Holding Company Act of 1935.

An indenture trustee is deemed to have a conflicting interest in the following cases: (r) If he is trustee under another indenture under which any other securities, or certificates of interest or participation in any other securities, of an obligor upon the indenture securities are outstanding unless (a) the indenture securities in question are collateral trust notes under which the only collateral consists of securities issued under such other indenture, or (b) such other indenture is a collateral trust indenture under which the only collateral consists of the indenture securities in question, or (c) such obligor has not substantial unmortgaged assets and is engaged primarily in the business of owning, or of owning and developing and/or operating real estate, and the indenture to be qualified and such other indenture are secured by wholly separate and distinct parcels of real estate.

The Act also considers the preferential collection of claims against an obligor, indentures of public utilities which must be qualified under the Public Utility Holding Company Act of 1935, duty to furnish bondholders list, reports, etc. It requires evidence of compliance with conditions precedent, prescribes the duties, responsibilities and special powers and claims of the trustee, notice of defaults, directions and waivers by bondholders. Procedurally, the commission is empowered to subpoena witnesses, and other departments of the Government are authorized to fur-

nish the commission such reports.

Miscellaneous.—Other significant measures have been enacted: to tax public salaries; to prevent pernicious political activities; amend National Stolen Property Act; aid in Federal reclamation; continue functions of Reconstruction Finance Corporation; postpone Federal Food, Drug and Cosmetics Act until Jan. 1, 1940; amend Civil Service Retirement Act; Merchant Marine Act of 1936, Agricultural Adjustment Act of 1938, Tennessee Valley Authority Act of 1933, Act authorizing the establishment of a Postal Savings Bank, and the Federal Seed Act. Lemons and Limes. Exports of lemons from the United States in the 1938-39 season (Nov. 1, 1938, to Oct. 31, 1939) were the highest on record, 830,855 boxes, a 15% increase over the 719,891 boxes exported in the preceding season and more than double the five-year (1931-35) average of 359,689 boxes. Up to 1930-31 the United States was a net-importer of lemons. Expansion of citrus groves in the United States and the League of Nations' sanctions on Italian lemons in 1935 and 1936, relating to the invasion of Ethiopia by Italy, were foremost factors in the increased foreign trade in United States lemons. Exports of lemons from Italy for the nine months ending July 31, were 6,227,330 boxes in 1939 and 5,585,332 boxes in 1938. Italian boxes approximate 70lb. each; United States boxes, about 76 pounds. Principal exports of lemons by the United States in 1939 and 1938 were to the following countries:

	1939	1938
	boxes	boxes
Canada	433,145	348,574
United Kingdom	278,422	268,595
France	55,679	14,509
Netherlands	14,932	29,136
Philippines	6,317	6,067
New Zealand	4,500	7,517

Production of lemons in the United States was 10,650,000 boxes in 1939 and 11,097,000 boxes in 1938, the ten-year average (1928-37) being 7,881,000 boxes, all in California. Production of limes in the United States (Florida) was 95,000 boxes in 1939 and 95,000 boxes in 1938, against a ten-year (1928-37) average of 20,000 boxes. (S. O. R.)

Leprosy. The investigations in leprosy during the year 1939 followed the principles and general pattern of the methods formerly evolved. Surveys of its prevalence have been extended to uncharted areas and in those previously registered. Thus, the currently estimated number of cases within the French colonies, possessions and mandates is 150,000. Among 15,000 forest-dwelling natives of the delta of the Niger river 500 cases were found, a rate of over 3%, and as a result of this and other pertinent surveys the conclusion is reached that there are more than 500,000 leprosy persons in Nigeria. Reports from other parts of Africa point to an average incidence of approximately one-tenth per cent of the populations in widely separated districts. In Portugal, whose population is cited as 6,500,000 people, 3,000 cases are reported to be scattered throughout the country, and as many as 200 live at large in one village. The disease is regarded as endemic in areas of the northern part of Western Australia and in the Northern Territory, but the number of leprosy and rate of incidence is smaller than that which formerly prevailed. Among the indigenous of New Caledonia the incidence is stationary, while among the immigrants and the European inhabitants it is declining. On the other hand, an examination of 10,245 of the 40,000

natives of Malaita, British Solomon islands, revealed 138 leprous individuals, a rate of 13.4 per 1,000 population.

The remarkable variations in the type of leprosy occurring over large areas and in different races occupying the same area are likewise again brought to attention by a survey of the Rangoon Leper asylum in which 75% of the Burmese patients are suffering with the cutaneous form and but 39% of the Indians. This disparity exists also, but in less degree, in the clinics of Burma. Contrariwise, it has been noted that most natives affected in Basutoland develop a light degree of the neural type.

Search for the explanation of these differences of clinical forms and incidence has been carried on, particularly through epidemiologic studies. An evaluation of the role of hereditary factors has been attempted by comparisons and contrasts in the evolution of the disease within families and especially in seven sets of twins among the leprous patients of Surinam. Leprosy developed in two sets of twin partners of like sex; in one partner of each of two sets; in both partners of one set of unlike sex; and it has not developed in two sets of like sex though they were intimately exposed to leprous relatives. In the leprous pair of unlike sex the age at which the disease appeared and its subsequent development were highly concordant. The relation between exposure to infection and development of the disease was analyzed by application of the methods of life tables to data collected in the examination of 8,007 persons constituting 1,051 household families in the Philippine islands. With the adoption of a period of one month as a unit of exposure, and the computation of the attack rate per 1,000 person-years (1,000 persons observed for one year), it was decided that the annual risk of contracting leprosy is about five times as high (5.1 to 0.9) with as without household exposure. Further, the highest rate occurred in those between 10 and 14 years of age. The effects of meteorological fluctuations upon leprous processes were sought in the records of 2,779 new cases admitted at the Calcutta clinic during the two-year period of 1936-38, and it was concluded that the greatest clinical activity, and the largest bacterial content of the neuro-macular lesions (spots or wheals in which sensation is abnormal) appear to coincide with the hot and relatively dry season of March to May, and to decline abruptly with the onset of the rains. A similar quest was conducted in Madras Presidency through whose 400 clinics there were 200,000 admissions during the nine years 1931-39. In this instance the high rate of incidence is attributed to the hot humid climate of the lowlands, and it is remarked that the higher rates occur among the poor depressed classes, and in those under 12 years of age among school-children. The caste and marriage customs are considered also to contribute to the incidence. The dietary of people among whom leprosy was of high incidence was studied in a group of 83 persons comprising 14 families which resided in a suburb of Madras, and within each of which leprosy existed. It was learned that the chief food was milled parboiled rice; the total intake of food was insufficient in calories; and the calcium and vitamin B₁ content were below an amount considered adequate.

Contributions to the detection of the first dermatologic manifestations of leprosy, and to the knowledge of its period of incubation within the patient are in progress in the Philippine islands. Six hundred and twenty-nine children, born of leprous parents between Sept. 1934 and April 1938, have been repeatedly examined since birth, and 35 have thus far exhibited skin lesions which are pronounced as leprous. The first lesions in 14 of these children were papules or wheals which were similar to lesions of less significance, but in which the specific bacteria were demonstrated. All the children have been under observation for a year, but the great majority are less than three years old. Serological tests of established cases have been continued with

modifications of technique and reagents (antigens) made from chemical extracts of tubercle bacilli, and from the bacillus of Stefansky (rat-leprosy). Strong reactions were obtained in cutaneous leprosy; weak or negative reactions in neural leprosy; and indefinite reactions in those cases whose classification is indefinite. However, positive reactions occurred also in tests of some non-leprous individuals who had malaria, syphilis, or tuberculosis. One investigator claims to have made the differentiation between syphilis and leprosy by serological examinations of the blood of 24 leprous patients with the use of an extract of *Spirochaeta pallida* (the micro-organism causing syphilis). The lesions of syphilis may resemble those of leprosy and an individual may be the subject of both diseases simultaneously, hence confirmation of this test will be of great importance to diagnosis and treatment.

The analogies between rat-leprosy, a disease of rats, and leprosy of man continue to stimulate investigations of this disease. It has been discovered experimentally that the bacillus of rat-leprosy will gain entrance to the underlying tissues through hair follicles of the skin which have been emptied of hairs by artificial depilation, and are carried from these follicles to remote locations in the body by phagocytic cells of the blood. The processes of the disease in the rat are being studied also by chemical and physical (ultra-violet light) examinations of the tissue cells and the bacilli, which are separated from the cells by procedures of centrifugation and washing. Also, the cells of these leprous tissues have been transferred to the culture tube and are reported to have been grown under artificial conditions. Rat-leprosy is distributed among rats in many parts of the world, and other rodents will contract it under experimental conditions, but it has been discovered recently in the bandicoot (a large Indian rat) under natural conditions in India.

Summaries of the results of treatment afford additional evidence of the tendency of the neural form of leprosy to become arrested naturally as well as with treatment. In Basutoland apparently 60% of the light neural cases registered during the past ten years have become arrested spontaneously; and at Magokai, Fiji islands, there were 161 patients in whom the disease became quiescent or arrested for from six months to two years among 560 who were under treatment, and 70% of the former were neural cases. The onset, symptoms and course of this form of leprosy have led to the hypothesis that a vitamin deficiency may be a factor in its development, and in several localities treatments by hypodermic injections of vitamin B₁ have been instituted. It is reported that neuritic pains are promptly relieved by this therapy, and the general physical condition of the patient is improved. Another treatment of neuritic pain and persistent ulcers has been that of resection of a portion of the involved autonomic nervous system, and recently it has been proposed after several trials that the same purpose can be accomplished by the injection of novocaine around the large plexuses of this nervous system in the region of the kidney. Hygiene*, 42:1-13 (1938). (N. E. W.)

Lettuce. Production of lettuce in the United States in 1939 was reported by the Department of Agriculture as 24,066,000 crates compared to 19,676,000 crates in 1938 and a ten-year (1928-37) average of 19,433,000 crates. The acreage was 171,370 in 1939. In 1938 it was 150,220 acres. The ten-year average was 154,280 acres.

Prices ranged from 77¢ to \$1.68 in 1939. Average prices were \$1.40 a crate in 1939, and \$1.50 in 1938, with a ten-year average of \$1.51 per crate. Production in the United States, by seasonal varieties, was as follows in 1939, in 1938, and for the ten-year (1928-37) average:

	1939	1938	1928-37
Early	6,670,000 crates	4,776,000 crates	5,259,000 crates
Second early	7,481,000 "	5,804,000 "	5,382,000 "
Intermediate	801,000 "	809,000 "	939,000 "
Late (1)	4,210,000 "	3,689,000 "	3,576,000 "
Late (2)	4,994,000 "	4,598,000 "	4,277,000 "

(S. O. R.)

Lewis, James Hamilton (1866?-1939), U.S. senator, was born at Danville, Virginia. The date of his birth is believed to be May 18, 1866, though he concealed his exact age. Both his parents died when he was an infant. As a child he was taken to Georgia, where he attended Houghton college. Later he studied at the University of Virginia and took courses in law at Savannah, Georgia. He went to the Pacific coast in 1886 and worked for a while as a stevedore on the Seattle waterfront. After being admitted to the bar in Seattle he entered politics and was elected representative at large in the U.S. Congress from Washington in 1896. He served as a colonel and inspector general in Cuba during the Spanish-American war, was later transferred to military duty in Puerto Rico, and from 1898 to 1900 was in the Philippines. Lewis moved to Chicago in 1903 and was city attorney and corporation counsel from 1905 to 1907. Elected U.S. senator from Illinois in 1912, he was appointed by President Wilson as representative of the Senate in London to prepare international laws for safety at sea. He was elected to the senate again in 1930 and re-elected in 1936. His colleagues honoured him by making him the first whip of the upper house and re-electing him unanimously to that position annually. His dress, tact and courtesy made him one of the most picturesque of American legislators. He died at Washington, D.C., on April 9.

Liberia, area c. 46,000 sq.mi.; pop. (est. Dec. 31, 1937) 2,500,000. Chief town (capital) Monrovia (pop. 9,700). President: Edwin Barclay; language, official, English; religion, Christian (Protestant).

History.—This independent African State enjoys a constitution modelled on that of the United States. There has been considerable improvement in the administration in recent years in consequence of which the United States has granted recognition to the Government, previously withheld. A program of expansion in the fields of health and education was continued during 1939 but the lack of modern communications—there are no railways—retards progress in the more remote districts. It is proposed to send students from Liberia college, the principal educational centre, to Achimota college in the Gold Coast. Rubber is exploited by an American company, Firestone Plantations. Liberia took an early opportunity of notifying the belligerent powers of her neu-

trality in the present war.

(J. L. K.)

Banking and Finance.—In 1937: revenue \$1,009,433; expenditure \$969,921; public debt (Dec. 31, 1937), external \$1,737,000; internal \$291,942. Currency: Liberian dollar, exchangeable at a fixed rate of \$4.80=£1 sterling.

Trade and Communication.—Overseas trade 1938: imports \$2,241,792; exports \$1,990,255. Communications 1938: roads suitable for motor traffic c. 150mi.; shipping cleared, 1,761,715 tons.

Agriculture and Mineral Production.—In 1938 (export figures) (in metric tons): rubber, latex 1,457; rubber, crepe 1,456; piassava 5,008; coffee 892; cocoa 549; palm kernels 462,682 bushels; gold 1,902 troy oz.; ivory 9,147lb; palm oil 162,757 imperial gallons.

Libraries. The use of libraries continued to increase without a corresponding increase of income. Although slightly larger expenditures were reported in many libraries, in general the situation in tax-supported libraries in the United States showed no great improvement as compared with 1938. Salaries of the majority of the professional staff are still distressingly low. It is estimated that 4% of the active librarians (12,124) are unemployed. Because of diminishing returns from invested funds libraries supported in whole or in part by income from endowments are facing a period of retrenchment and curtailment of services.

According to a report of the Library Extension Board more than 42,000,000 people in the United States, of whom 91.8% live in rural areas, were still without library service. The problem of library extension is primarily one for the appropriate agencies of the various States. The United States Office of Education has in preparation a study of the organization and functions of such agencies. State aid was initiated or continued in Arkansas, New Hampshire, Ohio, Pennsylvania and Vermont; in Canada, in British Columbia and Nova Scotia.

Michigan's \$500,000 fund was repealed and Illinois' \$415,000 program was vetoed. The Harrison-Thomas education bill, which includes provision for Federal aid for libraries, did not come up for action by Congress in the 1939 session; it is hoped that it will be introduced early in 1940.

Library Training and Personnel.—The 1938-39 report of the Board of Education for Librarianship (American Library Association) lists 31 schools of various types accredited by the board as meeting its standards; all are connected with teaching institutions. On March 1, 1939, the total enrolment was 1,750, including 211 for advanced study. The University of Wisconsin and Pratt Institute now require a bachelor's degree for admission to the library schools. The Hampton Institute Library school (for Negroes), organized in 1925, closed in June 1939. Temporary provision for the training of Negro librarians under the guidance of Miss Florence Curtis has been made by the Carnegie corporation.

In addition to scholarship funds provided by individual schools, the Carnegie corporation made a final appropriation of \$20,000 for the United States, and \$5,500 for Canada to be used over a three-year period for grants-in-aid for advanced study and research. The corporation also made endowment grants of \$50,000 each to the library schools of Pratt Institute and the University of Denver. The summer institute, as a means of assisting librarians in service to continue their professional preparation, met with a gratifying response from accredited schools. There has been further discussion of library "internships" as a method of training.

The Board on Salaries, Staff and Tenure (American Library Association) has in preparation classification plans for libraries in institutions of higher education (*i.e.*, university, college, junior

college and teacher training) similar to the *Classification and Pay Plans for Municipal Public Libraries* issued in 1938. Attention has also been given to the question of civil service in libraries.

Bibliography.—The second convention of the Inter-American Bibliographical and Library Association, held in Washington in Feb. 1939, and the conference on Inter-American relations in the field of publications and libraries, held in November, also in Washington, under the sponsorship of the State Department, are evidence of a desire to strengthen cultural relations with Latin-America. To provide for more effective co-operation, a grant of \$30,000 was made by the Rockefeller Foundation for the development of a Latin-American program by the American Library Association. Another event of importance was the appointment of Lewis Hanke as chief of the Hispanic division of the Library of Congress (July 1). The Rockefeller Foundation has also made a grant of \$60,000 to the American Library Association to be used over a three-year period for the purchase of American books of general interest, to be sent to selected popular libraries in northern and western European countries, to give European readers "freer access to the thought of American men of letters and of science." The Carnegie corporation, in addition to many other grants for library interests, appropriated \$198,000 for the development of teachers college libraries through purchase of books over a three-year period. The Association of College and Reference Libraries, organized in 1937 as the successor of the College and Reference section of the American Library Association, issued the first number (December) of its new journal, *College and Research Libraries*, under the editorship of A. F. Kuhlman.

Shortly after the outbreak of war in Europe a joint committee was formed to represent the American Library Association and other library organizations in the matter of the importation, particularly from Germany, of books and periodicals needed for research. Delay and irregularity in shipment, and the possibility of loss in transit, are inevitable under conditions of war. The Librarian of Congress agreed to act on behalf of American libraries in presenting to the State department statements sent to him through the committee.

Microphotography.—Interest and experimentation in the application of microphotography to library and research problems continue unabated. At present there is great need for simple, inexpensive reading machines, and several new models adapted for use with any microfilm have been introduced. New microphotographic laboratories were opened at Brown university and the Library of Congress. Possibility of destruction of books and manuscripts by aerial bombardment has quickened interest in microphotography in various European countries. Courses in microphotography for libraries were offered in the 1939 summer sessions of the Chicago and Columbia university library schools.

Eighteen libraries contain more than 1,000,000 volumes each, according to the latest available statistics: the Library of Congress, 5,591,710 volumes (June 30, 1938); the New York Public Library, 4,090,379 volumes (comprising reference department, 2,687,377 volumes and circulation department, 1,403,002 volumes) (Dec. 31, 1939); Harvard university, 4,079,718 volumes (July 1, 1939); Yale university, over 2,850,000 volumes (June 30, 1939); Cleveland (Ohio) Public Library, 2,161,390 volumes (Dec. 31, 1938); Chicago (Ill.) Public Library, 1,718,867 volumes (Dec. 31, 1938); Boston (Mass.) Public Library, 1,701,166 volumes (1939); Columbia university (New York city), 1,615,051 volumes (1939); Los Angeles (Calif.) Public Library, 1,601,447 volumes (June 30, 1939); University of California, approximately 1,314,000 volumes (comprising nearly 1,000,000 volumes at Berkeley and more than 314,000 volumes at Los Angeles) (1939); University of Chicago, 1,232,745 volumes (June 30, 1938); Cincinnati (Ohio) Public Library, 1,224,007 volumes (Dec. 31, 1938); Brooklyn (New

York) Public Library, 1,153,136 volumes (Dec. 31, 1938); University of Illinois, 1,130,584 volumes (July 1, 1938); University of Michigan, 1,025,815 volumes (June 30, 1938); Carnegie Library of Pittsburgh (Pa.), 1,017,856 volumes (Dec. 31, 1938); University of Minnesota, 1,017,690 volumes (June 30, 1938); Cornell university (Ithaca, N.Y.), 1,010,170 volumes (1939).

Such figures are very uncertain standards of comparison, because of differences in methods of counting and because public libraries with many branches contain many copies of new and standard books.

Library Buildings.—The Library of Congress Annex, occupied in 1939, adds 249mi. of shelving and 20ac. of floor space to the national library, over-crowded for many years. The administrative offices, cataloguing, book order and binding departments of the Brooklyn (N.Y.) Public Library have been moved to the new central building. Transfer of the public departments awaits further appropriations needed to provide for additional staff, and for the increased cost of maintenance. On April 1, the remodelled building (cost \$1,600,000) of the New York Historical Society (New York city) was opened after having been closed for two years. The cornerstone of the Franklin D. Roosevelt Library at Hyde Park, N.Y., was laid by the President on November 19. It is expected that the building (cost \$350,000) will be opened in the spring of 1941. Other buildings completed or dedicated during the year were: Babson Institute, Babson Park, Wellesley, Mass. (cost \$200,000); Bennett college, Greensboro, N.C. (Thomas F. Holgate Library; cost \$100,000; capacity 60,000 volumes); Drew university, Madison, N.J. (Rose Memorial Library); Fort Worth (Texas) Public Library (cost \$400,000; capacity 180,000 volumes); Littauer Center of Public Administration, Harvard university (contains library); Illinois State Archives building, Springfield (archives a division of State library; cost \$820,000); University of New Mexico, Albuquerque (cost \$341,416); College of New Rochelle, New Rochelle, N.Y. (Mother Irene Gill Memorial Library; cost \$400,000; capacity 108,000 volumes); Oregon State Library, Salem (cost \$850,000; capacity 525,000 volumes); Talladega college (Negro), Talladega, Ala. (Savery Library; cost \$150,000); Washington, D.C., Public Library, Petworth Branch.

Librarians.—Herbert Putnam, librarian of Congress for 40 years, retired August 1, becoming librarian emeritus. On June 21, at the Conference of the American Library Association held in San Francisco, he was chosen to receive the Joseph W. Lippincott award for the "most outstanding contribution to librarianship." The presentation was made in New York on October 18 at a luncheon in Dr. Putnam's honour.

On June 6 President Roosevelt nominated Archibald MacLeish to be librarian of Congress, and on June 29 the appointment was confirmed by the Senate. Mr. MacLeish, born in 1892, trained in the law, is best known as a poet and the winner of the 1932 Pulitzer Prize for Poetry. He assumed office October 1. At the time of his appointment he was curator of the Nieman Collection of Contemporary Journalism at Harvard university. Late in the year Robert W. G. Vail, librarian of the American Antiquarian Society at Worcester, Mass., since 1930, was appointed director of the New York State Library at Albany, in succession to James I. Wyer who retired in 1938. He begins his new duties Jan. 15, 1940. Carl M. White, librarian of the University of North Carolina, will succeed Phineas L. Windsor who retires Sept. 1, 1940, after 30 years as librarian of the University of Illinois and director of its library school. Julian P. Boyd, librarian of the Pennsylvania Historical Society, was appointed librarian of Princeton university.

Louis M. Nourse became librarian of the Kansas City (Mo.) Public Library on March 1, 1939.

Ernest Cushing Richardson, for many years librarian of Prince-

ton university, and since his retirement in 1925 honorary consultant in bibliography and research in the Library of Congress, died on June 3 at the age of 79. Scholar and bibliographer, Dr. Richardson will be long remembered for his efforts to promote national and international co-operation in the organization and development of the materials for scholarly research. George Watson Cole, librarian-emeritus of the Henry E. Huntington Library (San Marino, Calif.) died on October 10, aged 89. The catalogues of the library of E. D. Church (now in the Huntington Library) which he prepared will long stand as models of scientific description and bibliographical scholarship. Mary E. Robbins, first director of the school of library science at Simmons college, Boston, died in June at Lakeville, Connecticut. The deaths of two younger librarians should also be recorded: on August 4, Donald B. Gilchrist, librarian of the University of Rochester since 1919; on December 19, J. Howard Dice, librarian of the University of Pittsburgh since 1920.

Herbert, *Personnel Administration in Public Libraries* (1939); Edna Ruth Hanley, *College and University Library Buildings* (1939); James Westfall Thompson, *The Medieval Library* (1939); A. E. Bostwick, *A Life with Men and Books* (1939). (C. F. McC.)

Great Britain.—Up to Aug. 1939 there was steady development of the library service in Great Britain, much evidence being shown of an increased interest by the general public in reading, cultural and recreational. Slum clearance and the migration of the population from cities to one-time country districts has been followed by the establishment of still more attractively designed public libraries which have immediately become a social asset, appreciated by a large percentage of the people. Owing to the war, the arrangements for the opening of the new Huddersfield Central Library were altered, but the fine new central library in the Civic Centre at Southampton was completed earlier in the year and opened by the duke of Gloucester.

The war naturally had a considerable effect on libraries, and the upheaval experienced in the first months seemed to presage severe restrictions of the service everywhere. Fortunately this did not happen and although some public libraries had to curtail hours, or had rooms commandeered or lost staff owing to military and civil defence calls, greater use of them than ever before resulted. Deprived of many other forms of entertainment, a great number of people found in the library a new source of enjoyment and this is reflected throughout Great Britain in the rising issues of books.

The national and the university libraries also had their service interrupted owing to the transfer of valuable material to safe places and the evacuation of some of the universities. Consequently research work suffered toward the close of 1939, but it was indicated that gradually the normal service of these institutions was being resumed.

In France, the great libraries such as the Bibliothèque National and the Mazarine closed down on the outbreak of war, but within two months opened again with a restricted service.

In Australia the publication of the New South Wales Libraries Advisory Committee Report, with its far-reaching proposals, focused attention on the library service of that State and progress is bound to be made.

In New Zealand, an important development was the appointment of a library liaison officer, attached to the Government Country Library Service, to co-ordinate the services, arrange for professional instruction and to develop propaganda. This was made possible by a Carnegie Corporation of New York grant to the New Zealand Library Association.

Lightning War. The term "Lightning War" (Blitzkrieg) can be used to indicate any kind of quickly waged war. However, it has come to mean a definite technique in quickly waging war. It means a war waged quickly by taking the fullest advantage of the powers of aviation, mechanization, and motorization to make good the limitations of infantry, horsed cavalry, horse-drawn artillery, and transport and pack artillery and transport. This while using their powers to make good the limitations of aviation, mechanization and motorization. By doing this, quicker and more continuous blows against an enemy can be struck than was true when the older type of arms alone were used. At the same time harder blows and more effective ones can be dealt than if aviation, mechanization and motorization alone were used.

Experimentation by the German and Italian armies and air forces in Spain during the Spanish Civil War proved and disproved various theories held in these armies and air forces with respect to the technique of Lightning War. As the result of these experiences both countries made changes in their organization, armament, and tactics.

Albania was a dress rehearsal on a small scale for the Italians. The conquest of Poland in less than three weeks by the Germans was effective proof that the technique was correct.

Admitting that the weather favoured the Germans and that the Polish initial concentration was bad from a strategical point of view, the fact remains that it was not either of these factors but the German preparation to wage, and skill in waging, blitzkrieg which brought about the decisive defeat of the Polish Army and air force in such a short period of time.

The Polish Army and air force were not poor ones. From the point of view of organization, equipment, and armament of those countries as yet unprepared to either meet or wage this type of war, the Polish forces were both first class. However, the Polish air force was greatly inferior in strength to that of Germany.

The Polish infantry division, as is true of most divisions of infantry throughout the world today, did not have the considerable proportion of anti-tank and anti-aircraft weapons which make up the armament of the present German divisions. The Poles lacked the mechanized force essential to a cavalry corps. Without a mechanized force horsed cavalry cannot meet modern conditions. The Polish Army as a whole lacked the artillery of various types, the tanks, and the aviation necessary under modern conditions to either successfully resist or wage blitzkrieg.

In general, the method of waging blitzkrieg is as follows:

- (1) An attack from the air on all enemy aviation fields and centres.
- (2) At the same time, if the attacker has enough aviation, if not immediately after (1), an attack on everything necessary for the mobilization and concentration of the enemy's army, such as barracks, depots, supply centres, bridges, railway stations and junctions, railways and motor convoys.
- (3) If the border is fortified or already defended by troops in position, a standard assault is made consisting of a heavy bombardment of artillery of all calibres followed by a heavy aviation bombardment and then, as the infantry and tanks move to the assault, light bombers dive and bomb the enemy's position.
- (4) The way having been opened by this successful assault the pursuit of the enemy's beaten forces is taken up by the light divisions supported by aviation. The organization of these divisions varies in different countries, but in general includes motorcycle infantry and machine guns, armoured cars, horsed cavalry, and sometimes horse-artillery, light tanks carried in trucks, motorized infantry and artillery, anti-tank guns, engineers and signal troops.
- (5) Following come the armoured divisions of various organization in different countries. In general, each division consists of a reconnaissance echelon, a tank echelon, and a ground-holding echelon. The first is made up of motorcycle infantry, armoured car companies and a company of heavy infantry weapons. The second consists of approximately 400 tanks organized in two regiments. The third is made up of a motorcycle infantry battalion, a motorized infantry regiment, a motorized artillery regiment, anti-tank and anti-aircraft artillery, signal and engineer troops.
- (6) Back of all come the standard type of infantry divisions with their accompanying artillery of all types, ready to give and take the hardest kind of blows. Frequently, the leading divisions are motorized.

The light and armoured divisions are not expected to do heavy fighting. They are for the purpose of surprise, to turn flanks, to break through wherever the resistance is not heavy and to pursue beaten troops. In all this the aviation lends the closest support through reconnaissance by attacking troops on the road and by the closest tactical support in action.

Where well armed enemy infantry ready to fight and in a good position to do so is encountered, the light and armoured troops go around a flank and leave the heavy combat for the regular divisions following in rear. In this way the enemy after his initial defeat is never allowed the opportunity to reform and reorganize.

If the border can be crossed before the enemy has completed his concentration, or better yet, his mobilization, then the chance exists to disorganize him thoroughly before he has completed his preparation to fight. Even in the countries which have universal service coupled with all preparation in the shape of equipment, armament and reserve officers and non-commissioned officers for a mobilization of their army to its war strength, time is necessary before this mobilization can be completed.

After mobilization more time is necessary to transport the troops mobilized to their concentration points near the threatened border. If the invader is already mobilized and concentrated, this time element gives him the chance to initiate Lightning War and get it well under way. Thus blitzkrieg even if not a surprise as to the place where the border is crossed can be called a surprise in time.

There are two other elements which increase the chance for a fully prepared country like Germany or Italy to wage blitzkrieg successfully. The first is to have not only strategic railways but also strategic autostrades. Even though Germany's railways have not been maintained in the best condition, they have been built for strategic purposes; that is, to insure mobilization and concentration of the German Army on the frontiers of possible enemies. In addition to this, the Germans have constructed or have under construction to meet all strategic needs broad motor roads with every modern improvement to insure safe and quick passage of columns of motorized and mechanized troops. Some of these roads will permit four columns of mechanized or motorized troops to advance in the same direction at the same time. The other important preparation is the mobilization of all industry, either promptly when war comes or before the outbreak of war. This not only insures the army and air force being amply supplied with all equipment and armament when war comes, but also the maintenance and replacement of this equipment and armament, as the war progresses. Maintenance and re-

placement in modern war is a burden which only a large, efficient modern industry can meet. Such industrial mobilization also insures the possibility of re-equipping and rearming with new types developed during war. These two factors, strategic communications and industrial mobilization, are absolutely essential if blitzkrieg is to be successfully waged. The army of the United States, including both the regulars and National Guard, is not equipped and armed either to resist or wage blitzkrieg successfully. The strategic railways and autostrades necessary to quickly concentrate U.S. troops do not exist on large sections of the frontiers and seacoasts. The industry of the United States would need at least a year and perhaps longer before it could be mobilized for war purposes. The only sure means of preventing blitzkrieg is, for a sea power, the possession of a fleet so strong that no possible combination of enemy sea powers could defeat it, and for a land power, the fortification of its frontiers with a Maginot or Siegfried Line constantly garrisoned with sufficient troops to prevent surprise attack.

Modern industry gives the industrial nations today the same chance for dominance on land which they have had at sea since the industrial revolution gave them the opportunity to build modern navies, while denying it to the non-industrial nations. This because only nations with a first class modern industry can prepare for and successfully wage blitzkrieg. (See also AIR FORCES; ARMIES OF THE WORLD; EUROPEAN WAR; STRATEGY OF THE EUROPEAN WAR; TACTICS IN THE EUROPEAN WAR.)

Lime. The popular conception of lime is primarily as a building material, but this is not the case; of the 3,347,000 short tons produced in the United States in 1938, only 26% was used in the building industry, and even in pre-depression days, when building was much more extensive, the proportion was well under one-half. Agriculture used 11%, and of the remainder 38% went to chemical, 15% to metallurgical and 10% to refractory uses. Of the total sales, about one-third is as hydrated lime and two-thirds quicklime. In Canada production dropped from 674,100 short tons in 1929 to 320,700 tons in 1932, increasing to 473,300 tons in 1936 and 549,350 tons in 1937, followed by declines in 1938 and 1939. (G. A. RO.)

Limes: see LEMONS AND LIMES.

Limestone: see STONE.

Lindemann, Ferdinand von (1852-1939), German mathematician, was born in Hanover on April 12, the son of a teacher. He studied at the universities of Goettingen, Erlangen, Munich, London and Paris. He taught first at Erlangen, Wuerzburg and Freiburg, then at Koenigsberg, where he was rector in 1892-93. He was rector of the University of Munich in 1904-05 and full professor of mathematics there from 1893 until his retirement. Lindemann, who first proved the mathematical impossibility of squaring a circle, received the Steiner prize of the Prussian academy in 1900. He died at Munich March 7.

Lindgren, Waldemar (1860-1939), U.S. geologist and authority on mineralogy, was born February 14 at Kalmar, Sweden, and was educated there and at the mining academy at Freiberg, Germany. After moving to the United States he became assistant geologist of the U.S. Geological Survey in 1884 and later (1911-12) he was chief geologist. From 1912 until his retirement in 1933 he was professor of economic

geology and head of the department of geology at Massachusetts Institute of Technology. In 1924 he was president of the Geological Society of America, and in 1937 the Geological Society of London awarded him the Wollaston medal, premier international award for research in mineralogy. He died November 3 at Brookline, Massachusetts.

Linebarger, Paul Myron Wentworth (1871–1939), U.S. jurist and author, was born in Warren, Ill., on June 15. After attending Naperville college and Lake Forest university, he studied law in Paris from 1889 to 1892. He was admitted to the bar in Chicago in 1893 but returned to Europe shortly thereafter to continue his studies at the University of Heidelberg. During the Spanish-American War he was a lieutenant in the First Illinois cavalry. From 1901 to 1907 he was U.S. Judge in the Philippines. He resigned from the bench to become legal adviser to Dr. Sun Yat Sen, a position he held until the death of the founder of the Chinese republic in 1925. Later, from 1930 to 1937, he was legal adviser to the Chinese Nationalist Gov't. As "Paul Myron" he was author of books in several languages, notably the authoritative biography, *Sun Yat Sen and the Chinese Republic* (1924). Other works were *This Side of France* (1918), *The World Gone Mad* (1922), and *The Ocean Men* (1934). Mr. Linebarger also was founder and editor of the *Chinese Nationalist*. He died February 20 at Washington, D.C.

Linen and Flax. The fear of international hostilities, which had a depressing effect on the linen and flax industry in 1938, was realized in 1939. The result, however, was that at the close of 1939, there was serious shortage of supplies and a strong price trend. The cutting off of Russia and Germany from Irish manufacturing consumers because of the outbreak of hostilities plus the difficulties of maintaining any reasonable flow of trade with Estonia, Latvia and Poland, the other chief sources of flax supply, made the filling of orders a problem.

The year started with a continuation of the 1938 conditions. Demand was very light and the only activity in the Irish linen industry was that of supplying tent duck to the Government. Fine weave linens were piling up in warehouses due to restricted Far East shipments and United States buyers were not active. By May 1939, however, the Chinese shipments not only resumed on their usual scale but increased radically; 122.7% above the nine year average (1930–38) and 386.3% higher than in May 1938. China took 13.6% of the May 1939 exports from Ireland. Following that period, the failure of the Anglo-Japanese talks again left shippers uncertain. An encouraging note in 1939 was the putting into effect on Jan. 1, 1939, of the reciprocal trade agreement between Great Britain and the United States. Under the agreement, generous reductions in tariffs were made ranging up to 20% difference, especially in the finer weaves. Handkerchiefs were given a 15% difference, the duty being reduced to 35% instead of 50% on hemmed handkerchiefs. Table damask in the finer weave was reduced from 45% to 25%. Linen towels not exceeding 120 threads per square inch were reduced to 50% from 55% and under 120 threads per square inch from 40% to 20%.

This was hailed as a hope of more business from the United States and the publicity of the Irish Linen Guild at the New York World's Fair was also taken as a helpful indication by the Belfast market. The market was ready for any demands with large stocks in warehouses and plentiful supply in the looms. The only cause for apprehension was the securing of yarns. The Russia-German pact did not add any new problem as Soviet Russia had been withholding exports since 1938 and, it was expected, would not permit

any exports during the 1939–40 season.

The declaration of war in September brought a period of confusion when London wholesalers asked for deferred deliveries until they knew whether it would be necessary to remove their businesses out of potential air-raid areas; American buyers hurried home and Denmark, number one European customer, ceased buying. War-time regulation of the industry through the Flax Control Board limited supplies of yarn to filling contracts for private business placed prior to September 1, or for Government contracts. Prices of yarns increased 50% above 1938.

By October, these conditions had righted themselves and while prices were high, the warehouse stocks accumulated during the early part of the year found a ready market. Buyers from both North and South America apparently decided that it would be advisable to secure supplies while they were available. Chinese trade opened up and Denmark resumed ordering in November. The Neutrality Law of the United States also had its effect. It was expected that the Board of Trade would encourage linen shipments to the United States and Canada to provide the dollar exchange needed for purchase of armaments. Whether this hope was expressed by linen merchants to encourage more generous releases of yarns by the British Government agencies or was based on actual business indications still remained a question by December. However, the market was in a much better situation at the end of 1939 with a larger turnover of business than the previous year and the strong position of low stocks and restricted supplies. Higher costs were the chief concern; wages for workers in the handkerchief and other manufacturing sections increased 7½% and the prices of yarns, as previously noted, 50%. This shortage of yarns and high prices aroused a fear that the demand might revert to cotton and rayon during 1940.

(I. L. BL.)

Linn, James Weber (1876–1939), U.S. educator and author, was born at Winnebago, Ill., on May 11 and was graduated from the University of Chicago in 1897. He worked for a brief period as a reporter on the old *Chicago Record*, then returned to the university for graduate study. He was appointed assistant professor of English and remained on the faculty until his death. For 16 years he was a columnist for various Chicago newspapers, and he was the author of three novels, *The Second Generation* (1902), *This Was Life* (1936), and *Winds over the Campus* (1936). He also wrote *The Chameleon* (1903), *James Keeley, Newspaperman* (1937) and a biography of Jane Addams, who was his mother's sister. In 1938 Linn was elected an Illinois State representative on the Democratic ticket. He died at Lakeside, Mich., on July 16.

Linton, Edwin (1855–1939), American scientist, was born at East Bethlehem, Pa., on March 14. Educated at Washington and Jefferson college and at Yale, he became an instructor of mathematics at the latter institution in 1879. From 1882 to 1920 he was professor of geology and biology at Washington and Jefferson college. Dr. Linton, who was one of the world's leading authorities on the study of worms and parasitology, died at Philadelphia on June 4.

Lipman, Jacob Goodale (1874–1939), U.S. agricultural scientist, was born in Friedrichstadt, Russia (now a part of Latvia) on November 18; he was educated there by private tutors and later studied at Moscow. His family moved to the United States in 1888, and after several years of farming he entered Rutgers university, where he graduated in 1898. After receiving his master's and doctor's degrees at Cornell university he returned to Rutgers and was dean of the college of agriculture there from 1915 until his death. In 1911 he was also

appointed director of the New Jersey agricultural experiment station. Lipman was a pre-eminent authority on the chemistry of agriculture. He conducted pioneer research in soil nutrients which made possible more efficient and productive cultivation of crops. He made many significant investigations into the soil chemistry of nitrogen, sulphur, phosphorus, and other chemicals. In 1934 he received the Chandler medal for chemical research. He died at New Brunswick, N.J., on April 19.

Liquors, Alcoholic. The United States is the country of greatest production and consumption of potable spirits. Whisky is the predominant beverage. In the fiscal year ending June 30, 1939, the apparent consumption of all whiskies was 101,452,000 proof gallons. Of these there were 91,795,000 of domestic origin, and the balance largely Scotch and Canadian. Corresponding figures for gin, brandy and rum were 13,392,000 gallons; 2,229,000 gallons; and 1,775,000 gallons. By far, the majority of these spirits is produced in the United States.

The distillation of whisky (the word derives from the Celtic *uisquebaugh*=water of life) originated in Ireland in the 12th century, appeared in Scotland in the 15th century and assumed importance in England during the reign of Elizabeth. The first excise tax on distilled spirits dates from that period. Most of the whisky of today is produced in the United States, next are Scotland, Canada and Ireland. Considerable quantities are turned out in Australia and a few other countries.

Gin or geneva had its origin in Holland. English gin which was at first a copy of the Dutch product is known to the trade generally as London dry gin. It dominates not only the British but also the general world market. However, the production of gin in the United States is far greater than in England.

Brandy, or more specifically "grape" brandy was recognized for a long time as almost an exclusive product of France. In particular, the product originating from the Charente district and which alone is entitled to the designation "cognac" has been considered as a standard for this type of beverage. Lately, however, a quite fine quality of grape brandy has been produced in the State of California in the United States.

Rum, the distillate from fermented juice of sugar cane or molasses, was at one time a distinctive product of the West Indies, especially Jamaica. In the 18th century, the American Colonies took up the distillation of rum, adopting a somewhat different method which resulted in the New England type of rum. Up to the beginning of the 19th century, it was the predominating alcoholic beverage in America.

Other potable spirits are other fruit brandies, especially apple brandy or "apple jack," and a great variety of liqueurs or cordials. Many of these spirits are made almost exclusively in certain localities and then mostly from locally grown products, such as vodka (in Russia and Poland), kirschwasser (cherry brandy), slivovitz (prune brandy), and such specialties as benedictine, chartreuse and many others.

Until a few years ago, the world supply of whisky and gin was predominantly in the hands of English exporters, with Canada furnishing some whisky and Holland some gin. France shipped most of the brandy.

Literacy: see ILLITERACY.

Literary Prizes. Following is a partial list of the awards made in 1939.

International.—NOBEL PRIZE FOR LITERATURE (c. \$40,000): Frans Eemil Sillanpää, Finnish novelist. (See also NOBEL PRIZES.) ALL-NATIONS PRIZE NOVEL COMPETITION (\$15,000): Robert D. Q. Henriques, *No Arms, No Armour*.

United States.—ALL-NATIONS PRIZE NOVEL COMPETITION, AMERICAN SECTION (\$1,000): John Selby, *Sam*. ATLANTIC NON-FICTION PRIZE (\$5,000): Agnes Keith, *The Land Below the Wind*. COMMONWEALTH CLUB OF CALIFORNIA AWARDS TO CALIFORNIA AUTHORS, Gold medals: George R. Stewart, *East of the Giants* and Herbert Ingram Priestley, *France Overseas*. Silver medals: Oscar Lewis, *Big Four*, Edward Alexander Powell, *Gone Are the Days* and Dana Lamb (joint author with June Cleveland), *Enchanted Vagabonds*. DUKE UNIVERSITY PRESS PRIZE (\$1,500): Clement Eaton, *Freedom of Thought in the Old South*. JULIA ELLSWORTH FORD FOUNDATION CHILDREN'S BOOK CONTEST (\$2,000): Elinore Blaisdell, *Falcon*, *Fly Back*. FRIENDS OF AMERICAN WRITERS' PRIZE TO A MIDWESTERN AUTHOR (\$1,000): Herbert Krause, *Wind Without Rain*. GUGGENHEIM FELLOWSHIPS (c. \$2,500 each): Oscar Fritiof Ander, Herschel Brickell, Oscar Brynes, William S. Clark, Robert Donaldson Darrell, John Dos Passos, Elmer Ellis, Kenneth Fearing, Wallace K. Ferguson, Ernest C. Mossner, Herbert J. Muller, Charles John Olson, Gaines Post, Fannie Elizabeth Ratchford, Harold A. Sinclair, Robert Penn Warren, Arthur M. Wilson, Edmund Wilson, Howard Wolf, Richard Wright, Carl Zigrosser. HARPER NOVEL PRIZE (\$7,500): Vardis Fisher, *Children of God*. HOUGHTON MIFFLIN LITERARY FELLOWSHIPS (\$1,000 in addition to royalties and advances): Mary King, Helen Todd. NATIONAL BOOK AWARDS FOR 1938 (American Booksellers Association): David Fairchild, *The World Was My Garden*; Margaret Halsey, *With Malice Toward Some*; Daphne du Maurier, *Rebecca*; Anne Morrow Lindbergh, *Listen! the Wind*. JOHN NEWBERY MEDAL (most distinguished children's book, American Library Association): Elizabeth Enright, *Thimble Summer*. NEW YORK HERALD TRIBUNE CHILDREN'S SPRING BOOK FESTIVAL CONTEST (\$250 each): Alice M. Coats, *The Story of Horace* and Phil Stong, *The Hired Man's Elephant*. O. HENRY MEMORIAL AWARDS (best short stories): first prize (\$300), William Faulkner, *Barn Burning*; second prize (\$200), James Still, *Bat Flight*; third prize (\$100), David Cornel De Jong, *Calves*. POETRY (magazine) PRIZES (\$100 each): Maxwell Bodenheim, John Malcolm Brinnin, Malcolm Cowley, E. E. Cummings, H. B. Mallalieu, Stephen Spender. PULITZER PRIZES (\$1,000 in each class): fiction, Marjorie Kinnan Rawlings, *The Yearling*; drama, Robert Sherwood, *Abe Lincoln in Illinois*; history, Frank Luther Mott, *A History of American Magazines*; biography, Carl Van Doren, *Benjamin Franklin*; poetry, John Gould Fletcher, *Collected Poems*. MARY ROBERTS RINEHART MYSTERY NOVEL PRIZE CONTEST (\$1,000): Clarissa Fairchild Cushman, *I Wanted to Murder*. JAMES TERRY WHITE MEDAL (American Library Association): Louis Round Wilson, *A Geography of Reading*. JOHN ANISFIELD AWARD (\$1,000): Charles S. Johnson, *The Negro College Graduate*. DODD, MEAD DETECTIVE STORY (\$10,000): Hugh Pentecost, *Cancelled in Red*. HOPWOOD PRIZES (University of Michigan): poetry, John Anthony Ciardi, *Homeward to America*; fiction, Iola Fuller, *The Loon Feather*. SOUTHERN AUTHORS' AWARD: Ben Lucian Berman, *Blow For a Landing*.

Great Britain.—BENSON MEDAL (Royal Society of Literature): Christopher Hassall, John Gawsworth. JAMES TAIT BLACK MEMORIAL PRIZES (about £250 in each class): biography, Sir Edmund K. Chambers, *Samuel Taylor Coleridge*; fiction, C. S. Forester, *Flying Colours* and *A Ship of the Line*. CARNEGIE MEDAL (best juvenile book, Library Association of Great Britain): Noel Streatfield, *The Circus Is Coming*. SIR ISRAEL GOLLANCZ MEMORIAL PRIZE OF THE BRITISH ACADEMY (£100): John M. Manly, *The Text of the Canterbury Tales*. HAWTHORNDEN PRIZE (£100): Christopher Hassall, *Penthesperon*. HEINEMANN PRIZE (£40): Camille Mayran, *Dame en Noir*. IRISHWOMEN WRITER'S CLUB NONFICTION PRIZE: Mary Colum, *From These Roots*. STOCK PRIZE: Robert Graves, *Count Belisarius*.

Canada.—GOVERNOR-GENERAL'S AWARD: Kenneth Leslie, *By Stubborn Stars*.

France.—L'ACADEMIE FRANÇAISE. Le grand prix de littérature (20,000 fr.): Jacques Boulenger; Le grand prix du roman (10,000 fr.): Antoine de Saint Exupéry; Grand prix Gobert (18,000 fr.): Jean Leflon; Prix Louis-Barthou (22,500 fr.): Jacques Chevalier. PRIX PETITIDIER (15,000 fr. Maison de Poesie): Georges-Louis Garnier. RALPH B. STRASSBURGER PRIZE (\$1,000): Jean Pierre Le Mee, *Jeunesse d'Amérique*. GONCOURT PRIZE NOVEL (5,000 fr.): Philippe Hériat, *Les Enfants Gâtés*. FEMINA PRIZE NOVEL (5,000 fr.): Paul Vialar, *Rose de la Mer*.

Other European Prizes.—An extensive list is published in the winter number of *Books Abroad* (University of Oklahoma). (See also CHILDREN'S BOOKS.)

BIBLIOGRAPHY.—For historical information, see: Bessie Graham, *Famous Literary Prizes and Their Winners* (1939); Charlotte E. Murray, *Famous Literary Prizes* (1934). (M. A. WR.)

Lithium Minerals. Salts of lithium have long been used for medical purposes, and the metal has recently been used to some extent in the compounding of hearing metals. The latest addition to the use of lithium is the application of concentrated solutions of the chloride as a dehumidifying agent in modern air conditioning plants. The United States production of lithium minerals in 1937, amblygonite and spodumene from South Dakota, increased to 1,357 short tons. Ore production decreased heavily in 1938, but total output was increased by about 10 times in value, due to the recovery of lithium phosphate from the potash operations at Searles Lake, California. South-West Africa produced 764 long tons of amblygonite in 1938, and exported 315.5 tons. (See also METALLURGY.) (G. A. Ro.)

Lithuania, area 20,460 sq.mi. (excluding Memel area); pop. (est. Dec. 31, 1938, excluding Memel area) 2,575,000. Chief town: Kaunas (capital 130,000). President: Antanas Smetona; language: Lithuanian; religion: Christian (mainly Roman Catholic).

History.—Anticipating the eventual destiny of Memel, Lithuania decided in January to develop another overseas port at the fishing village of Shventai. Memel was ceded on March 22 in face

of a German ultimatum extending to about four days; and on the next day the state of emergency, proclaimed in Kaunas in December, was extended to the whole country. To compensate for loss of revenue resulting from this cession, a surtax of 25% was imposed on May 25 on the taxes on land, profits, income, etc., and the taxes on beer and cigarettes were increased. A trade agreement concluded with Germany on May 20 provided that Lithuania should receive a free zone south of the existing harbour at Memel, to be built by Germany; and on June 7 the compensation to be paid by Germany for Lithuanian property in Memel was fixed at 600,000,000 litas (about £22,000,000). In November all Lithuanian inhabitants of Memel were ordered to leave within 10 days, taking only personal luggage and 8 marks apiece. By the terms of the Soviet-Lithuanian pact of October 10 Russia gained the right to maintain limited land and air forces on Lithuanian territory, and the city and district of Vilnius (Wilno) was ceded to Lithuania. On October 27, the day of the official entry into Vilnius, a virtually compulsory internal loan of 60,000,000 litas was floated for the reconstruction of the city; and on October 29 Colonel Merkys, former governor of Memelland, was appointed governor of Vilnius. On March 27 the Government of Father Mironas resigned, and a new Government was formed by Gen. Chernius, with M. Urbsys as foreign minister. This was succeeded on Nov. 22 by a Government under Col. Merkys, with M. Urbsys foreign minister. (E. A. ASH.)

Education.—In 1937-38: elementary schools 2,601; scholars 307,173; secondary schools 273; scholars 31,647.

Banking and Finance.—Revenue (1938) 370,992,700 litas; expenditure (1938) 366,787,500 litas; budget estimate (1939) 367,900,000 litas; public debt (Dec. 31, 1938) 132,556,300 litas; notes in circulation (Aug. 15, 1939) 152,000,000 litas; gold reserve (Aug. 15, 1939) 62,000,000 litas; exchange rate (up to Sept. 1939) 27½-28½ litas=£1 sterling.

Trade and Communication.—Foreign trade (merchandise): imports (1938) 223,700,000 litas; (Jan.-Aug. 1939) 127,390,000 litas; exports (1938) 233,200,000 litas; (Jan.-Aug. 1939) 144,520,000 litas. Communications 1939: roads, suitable for motor traffic 20,948mi.; railways, open to traffic 1,173mi.; motor vehicles licensed (Aug. 31, 1938): cars 3,376; cycles 1,589; wireless receiving set licences (1938) 75,737; telephone subscribers (Dec. 31, 1938) 27,395.

Agriculture.—Production 1938 (in metric tons): rye 623,700, (1939) 653,400; oats 420,000, (1939) 401,700; barley 274,000, (1939) 246,700; wheat 251,300, (1939) 251,200; potatoes 2,118,300; flax and hemp (fibre) 25,800; butter 19,600. (W. H. WN.)

GERMAN SCHOOLGIRLS OF MEMEL organized their own celebration when Hitler seized the former Lithuanian port March 22, 1939

Little Entente. The Little Entente, a defensive alliance of Czechoslovakia, Rumania and Yugoslavia, against Hungarian aggression, found itself practically dissolved in 1939 by the extinction of one and perhaps the most active partner in the Entente. The dismemberment of Czechoslovakia in the fall of 1938 had not provided any opportunity for the *casus foederis*, as Hungary had refrained from any act of aggression and had received her share of Czechoslovak territory by negotiation. The Little Entente remained, however, in existence in 1939 as a defensive alliance between Rumania and Yugoslavia against Hungary and thus paralleled the defensive alliance of the two countries against Bulgaria as established by the Balkan Entente (*q.v.*). Hungary, while pressing her demands for the whole or part of Transylvania with renewed insistence against Rumania, expressed several times her readiness to arrive at an understanding with Yugoslavia and to drop all her claims against the latter country. In this endeavour Hungary found the active support of Italy. In case of success this Hungarian policy would mean the definite end of the Little Entente. (See also CZECHO-SLOVAKIA; HUNGARY; RUMANIA; YUGOSLAVIA.) (H. Ko.)

Livestock. Following the outbreak of war in Sept. 1939, belligerent governments adopted measures to encourage the production of meat animals and to further the imports of meat products. In the United Kingdom these various measures may be said to have culminated in absolute Government control when it was decreed that beginning with Jan. 15, 1940, all livestock (excepting hogs) marketed in the United Kingdom must be sold to the British Government. The Government set the prices and guaranteed a market consistent with farm costs. The Government also operated all slaughter houses and reduced the number from 16,000 to 750. Prices for cattle were announced as \$7.45 to \$11.58, according to grade; veal, \$11.74 to \$21.80; lambs and sheep, \$6.71 to \$28.50. In Canada a Government board took charge of ham and bacon production, under agreement with the British Government to take regular monthly quotas of pork products to Oct. 1940.

United States pork and lard producers in 1939 reported the largest pig crop on record and a huge export surplus. Exports of lard, however, were about 40% larger in the first 11 months of 1939 than in 1938, totalling 258,400,000lb. in 1939, while exports of pork for the first 11 months of 1939 were 112,200,000lb. or 24,600,000lb. more than in the same period of 1938. Germany negotiated pork product supplies with Hungary, Yugoslavia and Rumania, but apparently failed in negotiations with Bulgaria, which made arrangements to make shipments to Italy and Greece and also to Rumania. In the United States increased industrial activity maintained beef and mutton prices in the face of increased supplies. The trend in livestock in 1939 continued generally throughout the world to an increase in meat animals and a decrease in draft animals. Following are the numbers of livestock in various countries in 1939 and 1938 as reported by official sources and by the International Institute of Agriculture:

United States (as of Jan. 1)	1940	1939
Horses and colts	10,616,000	10,815,000
Mules and colts	4,321,000	4,384,000
Cattle and calves	68,769,000	66,789,000
Hogs and pigs	58,312,000	49,293,000
Sheep and lambs	54,473,000	53,783,000

Canada (as of June 1)	1939	1938
Horses and colts	2,824,340	2,820,700
Cattle and calves	8,474,600	8,511,300
Hogs	4,294,000	3,486,000
Sheep and lambs	3,365,800	3,415,000

United Kingdom (as of June)	1939	1938
Horses	1,075,700	1,093,500
Cattle	8,875,200	8,761,900
Hogs	4,390,100	4,383,100
Sheep	26,903,700	26,775,400

England and Wales	1939	1938
Horses	844,700	856,700
Cattle	6,762,200	6,714,300
Hogs	3,510,100	3,564,300
Sheep	17,976,100	17,912,500

Scotland	1939	1938
Horses	142,300	144,800
Cattle	1,360,000	1,315,700
Hogs	252,900	257,400
Sheep	8,042,000	7,969,000

Northern Ireland	1939	1938
Horses	88,700	92,000
Cattle	753,000	731,900
Hogs	627,100	561,500
Sheep	894,600	893,400

Germany (as of June 3)	1939	1938
Hogs	22,482,000	20,806,304
Sheep	5,712,423	5,679,125

New Zealand (as of April 30)	1939	1938
Horses	275,000	278,000
Cattle	4,505,000	4,506,000
Hogs	683,000	756,000
Sheep	31,858,000	32,379,000

Netherlands (as of May 15-17)	1939	1938
Horses	322,152	311,576
Cattle	2,817,314	2,763,453
Hogs	1,553,418	1,537,783
Sheep	689,501	654,251

Switzerland	1939	1938
Cattle	1,711,000	1,700,585
Hogs	880,000	922,821

Estonia	1939	1938
Horses	218,500	219,000
Cattle	705,000	660,900
Hogs	442,000	384,600
Sheep	694,700	649,700
Goats	3,500	2,200

Belgium (as of Dec. 31)	1939	1938
Horses	264,650	264,464
Cattle	1,689,680	1,710,037
Hogs	960,372	871,556

Bohemia-Moravia Protectorate	1939	1938
Horses	273,621	268,102
Cattle	2,260,735	2,311,037
Hogs	1,607,191	1,949,034
Sheep	21,992	25,220
Goats	591,669	612,880

Denmark (Hogs, Nov. 18; Cattle, July 15)	1939	1938
Cattle	3,258,000	3,186,000
Hogs	3,230,000	2,706,000

Latvia (as of June 26)	1939	1938
Horses	414,470	400,470
Cattle	2,102,500	2,102,380
Hogs	891,470	813,500
Sheep	1,409,570	1,360,460

Lithuania (as of June 30)	1939	1938
Horses	520,710	516,560
Cattle	1,103,550	1,097,340
Hogs	1,117,080	1,093,120
Sheep	1,223,600	1,208,420

Czecho-Slovakia (as of Jan. 1)	1939	1938
Horses	468,695	462,371
Cattle	3,407,040	3,393,248
Hogs	2,082,733	2,523,988
Sheep	460,943	485,374
Goats	708,111	733,641

Hungary	1939	1938
Horses	939,422	813,591
Cattle	2,379,532	1,889,931
Hogs	3,885,643	3,110,160
Sheep	1,868,122	1,628,730
Goats	65,972	41,445

Local Government: see MUNICIPAL GOVERNMENT.

Locusts: see ENTOMOLOGY: *Locusts* and *Grasshoppers*.

Logan, Marvel Mills (1874-1939), American senator, was born January 7 at Brownsville, Ky., where he practised law from 1896 to 1912. He was county attorney in 1902 and 1903, first assistant attorney general of Kentucky from 1912 to 1916, and attorney general from 1916

until he resigned on June 1, 1917 to accept appointment as chairman of the Kentucky State tax commission. The next year he resigned from this position to return to the private practice of law at Louisville. He became judge of the Kentucky Court of Appeals in 1926 and chief justice of that court in 1930, again resigning upon his election to the U.S. Senate for the term 1931-37. In 1936 he was re-elected for the term 1937-43. At the time of his death in Washington, D.C., on October 3 he was the ranking Democratic member of the Senate military committee and also served on the judiciary committee. In the Senate he supported much of the New Deal's legislation, including the Supreme Court bill.

London. Again there were no general elections in London's local Government during 1939, and before its close an act was passed postponing such for the duration of the war and allowing for casual vacancies to be filled by co-option. In the Jubilee year of the London County Council, an event celebrated with fitting ceremony in March, the chairman was for the first time a woman—Mrs. E. M. Lowe, J.P., a former chairman of the education committee, and E. C. H. Salmon, M.C., succeeded Sir George Gater as clerk.

The county rate remained unchanged at 7s 9½d; the rateable value increased by over £900,000 to £62,484,038; the net debt of the Council stood at £87,269,000 (over £52,000,000 being in respect of housing), and the value of its landed property at over £50,000,000. Its houses and flats numbered over 92,000 with a population of some 400,000; and, while the population of the administrative county has decreased to 4,062,800, an increase of 80,000 during 1937 brings that of Greater London in 1938 (the latest date for which statistics are available) to 8,655,000.

London's outward aspect continued to change rapidly even before wartime had made its vast contributions in sandbags, shelters, whitewashed kerbs and numerous defence works, not to mention the absence of street- and advertisement-lighting. The new Adelphi building, completed in 1938, was in 1939 housing the Ministry of Supply; in Mayfair the reconstruction of Saville row, where a new police station replacing the famous "Vine street" has been built, was finished, and much progress had been made with the extension and re-alignment of Curzon street, which now affords direct access between Berkeley square and Park lane. The bottle-neck in Kensington High street was removed; new Government offices were going up in Whitehall gardens, where the excavators uncovered most interesting remains of the old Whitehall palace; Wellington barracks and Regent's Park barracks were being rebuilt; and of the recommendation made in the Bressey report, progress was made with the Cromwell road extension, the duplication of Blackwall tunnel, the reconstruction of Wandsworth bridge and its southern approach (part of the South Circular road), and certain other outlying connections. All opposition to the development of the south bank of the Thames between Westminster and Waterloo bridges was withdrawn, and the Council had authority to proceed with it at an estimated cost of £1,629,000.

Helped by the Pilgrim Trust's grant of £50,000 towards the £400,000 necessary for the purpose, Parliament square was preserved as an open space, and the Westminster hospital that stood there for so long was replaced by a huge new building in Horseferry road, erected at a cost of £850,000 and opened by King George in April. In Old Palace Yard, Westminster, the erection of the revised design for the King George V memorial, prepared by Sir Wm. Reid Dick, R.A. and Sir Giles Gilbert Scott, R.A., had been assured. In Bloomsbury the destruction of the charm of the old squares continued, the growth of the new university being responsible for that in Russell and Torrington squares while the

LIE-DOWN STRIKE of unemployed men in Oxford street, London, Jan. 17, 1939. They demonstrated for an increase in winter relief funds

Tavistock square demolitions were occasioned by the extension of the British Medical Association's building. On the Strand-Fleet street line the internal reconstruction of "the king's chapel of the Savoy", which was to have been dedicated as the chapel of the Royal Victorian Order in the presence of the King and Queen and Queen Mary in October, was completed; both the Lyceum and the Gaiety theatres were closed and are to be removed; and Anderton's hotel in Fleet street, on whose site has stood an inn since the 14th century, made way for a huge office building. Much of the Lyceum theatre site, as well as that of Inveresk house in Aldwych, will probably be thrown into the extensive "roundabout" that it is proposed to construct as the northern outlet of Waterloo bridge, whose reopening is due in June 1940.

In the City, All Hallows church, Lombard street, built by Wren on the site of a Saxon church, had made room for a bank, and its tower is to be re-erected at Twickenham; new entrance gates were provided, and other improvements made, at the Tower; certain wharves were removed to allow of the extension of the Billingsgate fishmarket; and the final demolition of Doctor's Commons—well known to Dickensians—for the enlargement of telephone headquarters was assisted in early August by a disastrous explosion which caused much injury and damage.

London transport had an exceptionally busy year; the important extensions to East Finchley (N.E.) and Stanmore (N.W.) were completed, and good progress was made with that to Loughton (E.) and with others in the north and west; the refashioning of the High street Kensington, King's Cross and Piccadilly circus tube stations was finished and that of the King's Cross underground and the Euston terminus of the L.M.S. put in hand; while since Jan. 1 more newly electrified branches of the S.R. came into use. Passenger fares were increased in June. Before the outbreak of war much A.R.P. work had been done, but on its occurrence it became necessary temporarily to close 19 stations and the tunnels under the Thames for further protective work.

On the road an improved type of bus appeared during the year and another 37 miles of tramway were replaced by the trolleybus system. Large numbers of buses and nearly all the "Green Line" coaches were requisitioned for military or ambulance service, and by the close of the year all services were running to a restricted though adequate wartime schedule.

Any hope of the Thames being used as a passenger waterway was again frustrated, but before the war London bade fair to become a world air-centre. It was hoped that the city's £1,100,000 "super-standard" airport at Fairlop (Essex) would be ready before the end of 1941; and in addition to this the development of Heston (Middlesex) and Croydon (Surrey), and the negotiations for the new site at Lullingstone (Kent) were well advanced.

(L. H. D.)

London University. Up to the end of June 1939 the activities of the university were maintained to the full and the number of students in attendance was nearly 1,000 more than at the same time in 1938.

The international crisis in Sept. 1938, however, had led to serious consideration of the position of the university in the event of war and, at the instance of the Government, plans were prepared for transferring the work of the university to less vulnerable centres. These plans had been put into operation and most of the Colleges were being given hospitality in the provinces. Some departments have closed but most of the undergraduate work is continuing. The Imperial college, the London School of Economics (for some evening work), and Birkbeck college (for day and evening work) are in London. The total number of students has materially decreased but London, like other universities, is playing an important part by providing classes for as many students as possible between the ages of 18 and 20 and for students for whom it has been decided that the wise course is to continue training. The more important examinations of the university are being held although courses and examinations for many of the academic diplomas have been temporarily discontinued.

(S. J. W.)

Los Angeles, county seat of Los Angeles county, and largest American city west of Chicago, has an area of 442 sq.mi.; its present population is estimated at 1,600,000 (1,238,048 in 1930, 1,024,779 in 1900). During Sept. 1939, a record-breaking hot wave was ended by exceptionally heavy rainfall, followed by an unusually dry autumn. Under the reform administration of Mayor Fletcher D. Bowron complete reclassification of the entire civil service was effected, progress was made in applying scientific principles to the selection and management of personnel. Arthur C. Hohmann was appointed Police Chief and the entire department was reorganized. The councilmanic election resulted in the choice of a majority of members favourable to the new city administration. Tourist business in southern California for 1939-40 season was estimated at \$300,000,000.

During 1939 death removed Carl Laemmle, Sr., celebrated executive of the films; Addison Day, prominent civic leader; Zane Grey, distinguished author; and Douglas Fairbanks, famous in the films. Fatalities from automobile accidents for the county were again high despite all safety programs, though the ratio has been slightly reduced. A master Civic Centre plan for the location of important new structures was advanced. Los Angeles is second to New York in dollar volume of new construction. For the first 11 months of 1939 construction in the city amounted to \$69,416,994, a gain of nearly \$6,500,000 over 1938; while the total for southern California during the same period was \$192,503,976, a gain of \$18,415,784. In the Baldwin Hills area a large-scale rental housing project ("Thousand Gardens") is scheduled

for development. The National Association of Real Estate Boards held its largely attended 32nd annual convention in Los Angeles from Oct. 23 to Nov. 2, 1939.

Los Angeles harbour benefited from the lifting of the arms embargo; areas in the Pacific free for operation of American vessels include the Indian ocean, Malay area, Tasman sea, Arabian sea, Persian gulf and Chinese coast territory. The European war brought unprecedentedly heavy orders to aircraft manufacturers about Los Angeles, especially to Douglas, Lockheed and North American. Demand for petroleum and gasoline was very heavy.

Plans for developing its own municipal electric system by Los Angeles began to take shape in 1909; thirty years later (Aug. 1939) the city achieved this goal by purchasing remaining distribution properties of the Southern California Edison Company within its limits. June 30, 1939 the assets of the Bureau of Power and Light were \$226,649,987; gross revenue, \$27,051,567; earned surplus, \$647,788,849—the largest publicly owned electric utility in the United States. E. F. Scattergood is chief electrical engineer and general manager. The Colorado river project under the Metropolitan Water District neared completion. The main line, from the intake to Cajalco reservoir, 242mi., was completed and water was delivered by November 19. The distribution lines, which will serve 12 cities besides Los Angeles, are 70% constructed. The huge project was financed from the proceeds of a \$220,000,000 bond issue voted in 1931. Present indications are it will be completed at a cost \$20,000,000 less than original estimates.

(R. D. Hu.)

Lothian, Philip Henry Kerr, 11TH MARQUESS OF (1882–), British diplomat, was born April 18; he was educated at the Oratory school in Birmingham and at New college, Oxford. In 1908 and 1909 he edited *The State* of South Africa. Returning to England, he was editor of the scholarly *Round Table* from 1910 to 1916 and for five years thereafter he was secretary to Prime Minister Lloyd George. For a year (1921–22) he was director of United Newspapers, Ltd. In 1931 he entered the cabinet as Chancellor of the Duchy of Lancaster, and in 1931–32 he was parliamentary under-secretary in the India office, being also chairman of the Indian Franchise committee in 1932. On April 24, 1939, Lord Lothian, who had not previously held a diplomatic post, was appointed ambassador to the United States to succeed Sir Ronald Lindsay.

Louise, Princess, DUCHESS OF ARGYLL (1848–1939), sixth child and fourth daughter of Queen Victoria, was born at Buckingham palace March 18. She married the Marquess of Lorne, later the ninth duke of Argyll, in March 1871 and accompanied her husband to Canada when he became Governor General of the Dominion in 1878. The duke of Argyll died May 2, 1914. Princess Louise, who was the great-aunt of King George VI, devoted much of her life to sculpture and painting. She died at Kensington palace on December 3.

Louisiana, first State carved from the Louisiana Purchase, admitted to the Union in 1812, popularly known as the "Pelican State" or "Creole State"; area 48,506 sq.mi.; population according to U.S. census of 1930, 2,101,593; estimated Jan. 1, 1940, 2,210,000. Capital, Baton Rouge, 30,729. The only cities with larger populations are New Orleans: 458,762; Shreveport, 76,655. Of the State's population 833,532 are urban, or 39.7%; 1,318,160 whites; 776,326 coloured; 2,064,517 native born; 37,076 foreign born.

History.—The legislature did not meet, but there was intense preparation for the State Democratic primary election of Jan. 16, 1940. On June 26, 1939, Governor Richard W. Leche resigned and

was succeeded by Lieutenant-Governor Earl K. Long, brother of the late Huey P. Long; and shortly thereafter a series of public scandals were revealed, involving the president and certain business officers of the State university, several building contractors engaged in construction at that and other State-supported colleges, and numerous politicians high in the councils of the State administration. Several of the malefactors were sentenced to State or Federal prison terms, others stand indicted though not yet brought to trial, and the widespread investigations by State and Federal

authorities still continued as the year ended. The charges included diversion, misuse and embezzlement of public funds, forgery, use of the mails to defraud, and other violations of State and Federal laws. These scandals provided the chief issue in the Democratic primary campaign for nominations to State offices, nomination being tantamount to election. Twelve gubernatorial aspirants announced their candidacies, but subsequent withdrawals left only five in the race. Earl K. Long, governor, is (Jan. 1,

EARL K. LONG became governor of Louisiana June 26, 1939

1940) the administration candidate, the other aspirants being supported by various opposition factions.

Notable progressive movements of 1939 were: completion of the new \$14,000,000 Charity hospital in New Orleans, and smaller charity hospitals in other cities; continued expansion of the industrial program; construction of additional farm-to-market roads as part of the State highway system; pushing toward completion the combined highway and railway bridge over the Mississippi at Baton Rouge; extension of the rural electrification system; enlargement of the soil-conservation program; establishment of additional trade-schools; an extensive building program at the State-supported institutions of higher learning; opening up of new petroleum fields; and large expenditures on public improvements by the State and its municipalities.

Principal State officers: Richard W. Leche, governor (to June 26, 1939); Earl K. Long, lieutenant-governor (to June 26; governor after that date); E. A. Conway, secretary of State; A. P. Tugwell, treasurer; L. B. Baynard, auditor; G. L. Porterie, attorney-general (resigned early in year, and has had two successors since); T. H. Harris, superintendent of education.

Education.—Education is free and compulsory for all children. Separate schools are maintained for white and Negroes. Over 500,000 pupils are enrolled in elementary and high schools, 10% of whom are in private and parochial schools.

Charities and Correction.—The State maintains the following: charity hospitals at New Orleans, Shreveport, Lafayette, Pineville and Independence, under the new social security program; insane hospitals at Jackson and Pineville; schools for deaf and blind at Baton Rouge; training school for feeble-minded at Alexandria; Soldiers' home at New Orleans. There are also numerous private and endowed hospitals and orphanages. The State maintains three prison farms for adult offenders, and separate training institutes for male and female juvenile delinquents.

Banking and Finance.—There are about 120 State and 30 national banks, with total assets of \$500,000,000, deposits of \$450,-

000,000 and capital, surplus and reserves of \$50,000,000. The State's bonded debt is approximately \$150,000,000; assessed valuation of property \$1,500,000,000; annual State budget \$60,000,000.

Agriculture, Manufactures, Mineral Production.—Cotton, sugarcane, corn, rice, sweet and Irish potatoes, and hay are the chief staple crops, valued at nearly \$200,000,000 annually. Dairying, stock-raising, citrus fruit culture and truck and vegetable gardening are also important agricultural activities. Louisiana is a heavy producer of lumber. About 1,600 industrial establishments, with 70,000 employees, receiving \$50,000,000 annually in wages, produce commodities valued at \$500,000,000.

Principal manufactures are lumber and other wood products, oil and other cotton-seed derivatives, rice products, paper, refined sugar, petroleum products, carbon-black, chemicals, canned vegetables and sea-foods and tropical clothing. Petroleum, natural gas, salt and sulphur are the chief mineral products, with combined annual value of \$150,000,000. (W. Pr.)

Lumber production in the United States for 1939 is estimated at 25,500,000,000 board feet, or about 18% above that of 1938. The United States Census Bureau reported 21,646,000,000 for 1938. The estimated production for 1939 is somewhat above the midway point between the five-year average of 1925 to 1929, inclusive, and the low point of lumber production for several decades amounting to about 10,000,000,000 board feet in 1932. The leading species produced in order of importance are southern pine, Douglas fir, ponderosa pine, oak, white pine, hemlock, red gum, cypress and maple. Altogether about sixty species enter prominently into commercial lumber production. Southern pine is produced from 21 southeastern States, of which seven cut at least 500,000,000 board feet each. Douglas fir is cut in ten Pacific Coast and Rocky Mountain States, but two of these States, namely, Washington and Oregon, contributed about 95% of the total production of this species.

The outbreak of the European war early in September definitely affected both lumber production and the price structure. Generally prices advanced sharply during that month, and in some grades and sizes quotations advanced from 10% to 30%. Many mills, both in the South and on the West Coast, caught with low inventories were completely sold out, and refused further orders until Jan. 1, 1940. Lumber stocks in retail yards were generally low and this contributed materially to the advancing prices when the demand was felt at the mills.

Lumber exports were about 15% above 1938, although in the latter year they were the lowest for the past 40 years. Lumber exports advanced prominently during July and August 1939, but dropped off drastically during the following months. The signing of the Neutrality Act on November 4 definitely affected lumber shipments to Europe, which is the most important consuming market for export shipments from the United States. Railroad purchases of lumber, cross ties and structural timbers were a noteworthy feature during the summer months when railroad income began to show definite evidence of increase. Residential construction, which is the most important single item in lumber consumption in the U.S. was appreciably above the figure of 1938.

The two World's Fairs at New York city and San Francisco contributed to the increase of interest and use of lumber. About 27,000,000 board feet of lumber were used in covering more than 1,000,000 square feet of floor space at the Golden Gate Exposition. The use of timber connector construction played an important part at this Fair. More than 1,000,000 people visited the low cost five-room lumber exhibit house built by the National Lumber Manufacturers Association at the New York city fair.

In the foreign trade agreements which have been active for the past several years, the one with the United Kingdom and the sec-

and pact with Canada became effective Jan 1, 1939. Other negotiations are pending with Belgium, Argentina and Chile, as well as with some other important lumber importing countries.

Considerable attention has been given by lumber manufacturing concerns to a revision of American lumber standards, which have clarified definitions of grades and other matters important to architects, engineers, builders and others interested in lumber construction. One important basic improvement has been the inclusion of modern structural grading rules, which have been needed for many years. The Congressional Investigation Committee on Forestry held a number of hearings in the fall of 1939 to devise new legislation affecting forest policies on the part of the Federal Government. Hearings were held at Syracuse, New York; Mobile, Alabama; Portland, Oregon; San Francisco, California; and Madison, Wisconsin. Resulting legislation may have an important bearing on the lumber industry in the years to come.

BIBLIOGRAPHY.—R. C. Bryant, *Lumber*; Nelson C. Brown, *Logging—Transportation* (1934); Nelson C. Brown, *Logging—Principles and Practices* (1936); Nelson C. Brown, *Timber Products and Industries* (1937). (N. C. B.)

Other Countries.—The year 1939 will go down in lumber history as one of the most eventful periods ever known. Following a depression year from the lumber point of view, importers in leading European buying countries adopted a very cautious policy in the opening months of 1939. Softwood export quotas, fixed by the European Timber Exporters convention, were reduced from 3,164,000 standards in 1938 to 2,903,200 standards for 1939.

Purchases were very restricted until May, political uncertainties exercising a severe effect on the trade. Then the British Government introduced conscription and immediately a sharp impetus was given to the trade by the heavy demands for material for the building of hutment camps. In other European countries, too, demand quickened and prices went upward. The changed circumstances led the Exporters convention in August to increase the export quotas by 290,320 standards.

The European war revolutionized the trade. Under defence regulations, the British Government set up the Timber Control, and stringent regulations were imposed to ensure conservation of timber stocks in the country and to confine their use primarily to urgent work of national importance, such as defence work and air raid protection. All United Kingdom buying from overseas was concentrated in the hands of one buyer, the Timber Controller, and all stocks bought by him were to become national stocks. Toward the end of 1939 plans were being worked out for the rationing of these stocks and their allocation on a quota basis to importers and merchants for sale to consumers.

Germany's declaration of wood as contraband seriously hampered the export trade of the Scandinavian countries. Moreover, the over-running of Poland by Germany and the attack later on Finland by Russia put these two important timber exporting countries temporarily out of the picture. The result of the hostilities has been to change the directions of trade, and Britain has turned more and more to Canada and the United States for the satisfaction of her timber needs and to some of the smaller European countries that are not involved in the war. The loss of some important sources of supply has meant new and greater opportunities for other exporting countries that are rich in forest resources.

The value of timber exports into the United Kingdom in the eleven months, Jan. to Nov. 1939, was £34,708,162 compared with £39,413,401 in the corresponding period of 1938. (N. F.)

Lutherans. The Lutheran Church throughout the world, with a membership of nearly 70,000,000 faced the challenges of changing conditions with increasing gravity, during 1939. The situation, in Germany especially, made the serious considera-

tion of the old, unsolved problem of the relationship between the church and the State increasingly acute. The practical interests involved led to the restudy of fundamental principles, not for one country only but for the whole world. These changing conditions, challenging all of the claims of the Christian religion, influenced the executive committee of the Lutheran World Convention in the formulation of the program for its 1940 meeting in Philadelphia, Pa.

The year 1939 brought changed conditions which have required also a complete review of the work of the church in non-Christian lands, by all parts of the Lutheran Church engaged in foreign missions, placing upon Lutherans in America increased responsibility for missions heretofore maintained by European groups.

The movement for official union of the nearly 5,000,000 Lutherans in America according to reports on negotiations showed decided progress in 1939. A notable expression of the growing unity among Lutherans in America was given in a joint declaration, signed April 1939 by presidents of seven independent Lutheran bodies as the first such joint declaration on record. The title of that declaration was: "These Momentous Times," and it set forth "certain fundamental and controlling elements in the world's life," to be observed by Christians in times of confusion and chaos.

The possibility of war in Europe, as manifest at the time of the meeting of the Executive Committee of the Lutheran World Convention in Germany, May 1939, led that body of representatives of the Lutheran Church in all parts of the world to adopt a resolution that no matter what political or social issues or conditions might arise between nations, the bonds of Christian fellowship in the church should not be broken, but that the church would preserve its unity and continue its testimony against the evil of war, with continuous readiness to do its utmost for peace, while giving a full service of mercy to the suffering of all races and nationalities. (W. H. G.)

Luxemburg, an independent European State, south-east of Belgium, with which country an economic union was formed in 1922 and the customs frontier abolished. Area 999 sq.mi.; pop. (est. Dec. 31, 1937) 300,732. Chief town: Luxemburg (cap., 59,760). Ruler: Grand-Duchess Charlotte; language: Luxemburgian (idiomatic); official languages French and German; religion: Christian (mainly Roman Catholic).

History.—In April, the Grand Duchy celebrated the centenary of her independence, dating from the Treaty of London, April 19, 1839. On Aug. 3, 1939, the import quotas of a number of manufactured goods were suspended. Just before the outbreak of war in Europe, Luxemburg received assurances of respect of her neutrality from Germany (August 26) and France (August 29); but, though these assurances were observed during the remainder of the year, German preparations along the frontier were the object of an anxious watchfulness.

Finance.—Revenue (1938) 343,341,049 francs; (1939) 355,229,716 francs; expenditure (1938) 355,137,434 francs; (1939) 353,439,719 francs; floating debt (Nov. 15, 1938) 137,831,507 francs; consolidated debt (Nov. 15, 1938) 624,793,615 francs.

Lynchings. Five lynchings occurred, so far as could be learned, during 1939. Three of the victims were Negroes and two were white. Two of the lynchings occurred in Florida and one each in Louisiana, Arkansas and Mississippi.

Investigation, however, of the lynching of Joe Rodgers of Canton, Mississippi on May 8 disclosed a new technique in lynching which mobs in some States have adopted. Revelation of the sadistic details of lynchings during the debate on Federal anti-lynching legislation in the House of Representatives and the United States Senate had aroused public opinion, particularly in the South.

LYNCHINGS in the United States: number each year since 1900

Governors, chambers of commerce, and others who were working to induce textile and other mills to move their plants to the South found that lynching and mob violence was threatening the stability of labour supply as well as property and economically hurting States where lynchings occurred.

In the Joe Rodgers lynching, news of which appeared in no newspapers, the new technique was revealed of 30 or 40 mob members whose duty it was to take their victim to a secluded spot and there dispose of him. In one area of Mississippi it is alleged that at least four such lynchings occurred within a period of four months prior to the lynching of Rodgers who was put to death in the same fashion because he is said to have refused to pay rent for a company house belonging to the company for which he worked. It is alleged Rodgers refused because he had a home of his own.

Additional unpopularity of lynching was created by the jibes of Nazi and other newspapers when Americans criticized Nazi-Germany's mistreatment of Jewish, Catholic and other minorities. *Das Schwarze Korps*, organ of the Nazi storm-troopers, featured a photograph of President Franklin D. Roosevelt upon the occasion of his denunciation of the mistreatment of Jews in Germany when he declared that "It is difficult to believe that such things can happen in the 20th century."

Surrounding the President's photograph in *Das Schwarze Korps* were pictures of the lynching and burning at the stake of Negroes in the United States.

Efforts to secure enactment of the Wagner-Van Nuys-Capper-Gavagan-Fish Federal anti-lynching bill were continued during 1939. But neither house of Congress passed the bill. Refusal of the chairman of the House Judiciary Committee, Hatton W. Summers, of Texas, to permit that committee to report the bill out of the committee to the floor of the House for debate and vote caused action to bring the bill to the floor by means of a discharge petition which was successful when the necessary 218 members of the House signed the petition which brought the bill out on Jan. 8, 1940. (See also NEGROES, AMERICAN.) (W. WH.)

Lyons, Joseph Aloysius (1879-1939), prime minister of Australia from 1932 until his death, was born of a poor Irish immigrant family in Stanley, Tasmania, on September 15. His education was largely informal. After a period as a school teacher he was elected to the Tasmanian House of Assembly in 1909. He was premier of Tasmania from 1923 to 1928. He became Australian postmaster-general and minister of public works in 1929. Lyons broke with his fellow

ministers in Prime Minister Scullin's labour cabinet in 1931 and founded the United Australia party, a strong opposition group which swept Scullin from office. Lyons became prime minister in 1932. Probably the most noteworthy accomplishment of his three successive terms was his reorganization of Australian finances. Lyons visited the United States in 1935 and represented Australia at the coronation of King George VI in 1937. He died after a brief illness at Sydney on April 7.

McDonald Observatory: see ASTRONOMY.

Machado y Morales, Gerardo (1871-1939), Cuban politician, was born on September 29, in the province of Santa Clara, Cuba. He joined the island's separatist movement when he was a youth of 22 and was twice decorated for bravery in the outbreaks that preceded the declaration of independence from Spain. After several years in private life he became inspector general of the Cuban Army, and secretary of the interior in 1908. As leader of the Liberal party he was elected president in 1925 for a four-year term. By adroit manipulation of the congress and the constitution, he first secured extension of the presidential term to six years, then effected his own re-election in 1928. Economic distress and growing unrest of the army led to his overthrow in Aug. 1933. His enemies accused him of wholesale political assassinations, and a trail of indictments followed him into exile in the United States and Europe. He was arrested in New York city at the request of the Cuban Government in Nov. 1937, but the charges against him were dropped the next month. He died at Miami Beach, Fla., on March 29.

Machinery and Machine Tools. Semi-automatic and automatic metal-working machines, for many years selected only for work in mass production plants because of the time necessary to set up cutting tools and cams or other control elements, during 1939 found increasing application on short-run jobs. This trend toward simplified tooling and more easily adaptable machine tools has been gathering momentum during the past few years. It now is economical to assign jobs of less than 100 pieces to types of machines that only a few years ago would have been used only when requirements were numbered in thousands. Production managers whose plants are equipped only with standard general-purpose metal-working equipment are finding it more and more difficult to compete with plants that are taking advantage of the profit-making possibilities offered by up-to-the-minute machines.

Attention in machine design to refinements that make metal-working equipment easy to operate and accurately controllable was even more noticeable during 1939 than in 1938. Controls frequently are interconnected and interlocked to safeguard the machine, the work, and the operator—on many current machines the operator has only to press convenient pushbuttons to initiate a machining cycle once the work-piece has been loaded and clamped. Seeking to fill the long-existent gap between the plain precision bench lathe (long used for small work of accurate nature) and the precision toolroom engine lathe, a number of lathe manufacturers in 1939 placed on the market floor-type lathes of 9 to 11-in. diameter swing. Each features desk-high working position, with all controls within easy reach of the operator whether he be standing or seated. Such arrangements result in faster production, more accurate work and reduced operator fatigue.

Perhaps the most consistent trend in the design of machine tools was the increasing use of hydraulic operating units. Solenoid-operated valves, by means of which the electric drive and control system can be interlocked with the hydraulic system to provide

THE PATTERNS OF INTERNAL STRESS remain permanently in flywheels and other machine parts and can be photographed in colour by virtue of a new process in photoelasticity developed by Dr. M. Hetenyi in Pittsburgh

"fool-proof" operation and permit automatic control, had much to do with the continuation of this trend. Limit switches operated by moving machine elements frequently actuate these valves. In some machines, particularly grinders, even the lubricating circuit is interlocked with the electric drive so that the main drive motor cannot be started until oil pressure in the bearings is sufficient to provide adequate lubrication. Excessive pressure in this circuit, indicating clogged supply pipes, or a drop in pressure will actuate interlocks and stop the machine.

Grinding, honing, lapping and "superfinishing" methods continued throughout 1939 to hold the interest of metal workers. One of the principal developments in this group has been fostered primarily by manufacturers of aircraft engines, and is gradually finding acceptance with other manufacturers. This is the grinding of threads, frequently direct from the solid in a roughing and a finishing pass. The year 1939, in fact, saw the development of one of the first commercially successful machines for grinding internal threads to precision limits. The wheel spindle of this machine operates at up to 18,000 r.p.m. and is adjustable for helix angle. Wheel dressing is automatic. Lead accuracy is assured by using interchangeable master leadscrew and nut assemblies.

Another first for 1939, also in the grinding field, is a machine for finishing curved-tooth bevel and hypoid gears. Generated tooth profiles are ground in this machine by means of a relative rolling motion between the wheel and the work. This motion consists of rotation of the cradle on which the wheel is mounted and the rotation of the work on its axis. The relative motion is the same as though the gear being ground were rolling with a generating gear. Operation is automatic, once the work is chucked and the wheel dressed. More and more applications are being found for the "superfinishing" method of producing an extremely fine surface finish, which uses a combination of short motions, light abrasive pressures, slow cutting speeds, hard abrasive stones and

a carefully selected lubricant. Specially designed machines and special honing stones were required for each application when this method was introduced during 1938; the year 1939 saw the development of both a general purpose superfinishing machine and standard heads that can be used for developing superfinished surfaces in engine lathes. The general-purpose machine can be equipped for between-centre, collet or chucked work and has capacity for cylindrical parts up to 4in. in diameter and 18in. long. It already has been adopted for a wide variety of work.

Gear-tooth finishing with serrated cutters has found extensive application. Both rack-type and rotary cutters are used and the operation can be performed at high production rates. One machine, new in 1939, is capable of finishing either spur or helical external gears with a rotary cutter mounted in a head having angular adjustment so that either "crossed-axes" or "parallel-axes" finishing is possible. The slide which carries the cutter head is caused to reciprocate rapidly during the cutting operation, thus permitting the removal of considerable material while producing a fine finish on the work. It is claimed that the combination of rapid reciprocation with high-speed rotation results in highly accurate gears. The rotary tool can have either straight or helical teeth, depending upon the direction of the teeth on the gear relative to the gear axis and the necessary crossed-axis setting required for the best results. When employing the parallel-axis method, a straight-tooth tool is required for spur gears and a helical tool for helical gears. This method is necessary when finishing gears cut close to a shoulder, or grouped in a cluster. One tool can be used for finishing gears having a large range in pitch diameter, so long as the teeth have the same size.

Both a straight-line gear generator and a gear shaper using a disk-type cutter have recently been placed on the market for producing fine-pitch, small-diameter external spur and helical gears at high production rates. The gear generator differs from the shaper in that it employs a rack-type cutter carried in a clapper-type holder. Each of these machines is equipped with a magazine feed and operation is entirely automatic; cutter speeds can be as high as 2,000 strokes per minute. Another 1939 development is a medium capacity vertical gear hobber featuring automatic cycles and hydraulic control. The automatic cycle of this machine employs hydraulic pressure for actuating the hob carriage, clutches and clamping mechanism; mechanical drives to the hob spindle and screw feed; electrical drives to the hydraulic pump unit, coolant pump and work slide rapid traverse. Either conventional or "climb" cutting can be employed, merely by changing the setting of the controls.

Dies and moulds can be completed at one set-up in a rotary-head vertical milling machine recently announced. Layout, and all milling, drilling, boring and slotting operations can be performed without removing the die block from the table of the machine, thereby making possible major cost reductions because of the time saved, as well as insuring the production of more accurate dies. The rotary head carries a vertical spindle which can be set off centre radially and rotated in a planetary motion. Individual motors drive both the head and the spindle. A cherrying attachment mounts directly on the rotary head and ties together the cross-slide and vertical motions of the spindle, permitting circular movements of the cutter in a vertical plane. Because this cherrying attachment also can be used for angular cuts, conical cavities and projections can be generated by combining the cherrying attachment operation with the rotary motion of the head. Attachments for this machine permit slotting, right-angle milling and universal-angle milling operations.

Another interesting milling machine made available in 1939 is the straight-line "Mill-N-Shaver" which combines rough milling with a shaving operation to produce plane surfaces comparable

with those obtained by surface grinding. Essentially, this is a planer-type milling machine having a combination head which performs the rough milling operation during the forward motion of the table, positions the tungsten carbide shaving blade, and then takes the finishing cut during the "rapid traverse" return stroke of the table. Micrometer adjustment is provided for the shaving blade, which automatically is drawn back, out of the way, during the milling stroke.

Bar stock of unlimited length can be threaded in an unusual roll threader now on the market. Operation is entirely different from that of conventional roll threading equipment, which is limited in length of thread that can be produced. In this new machine roller dies take the place of the usual plate dies and are rotated around the work, which is fed through the die head for whatever length is desired. Only the length of the bar stock limits the length of thread that can be obtained. The machine looks very much like a conventional die threading machine, with the chasers being replaced by threaded rollers. Speed of rolling is, in some cases, as much as 50% more than is obtained when cutting threads.

Large-platen hydraulic presses have found much favour in the aircraft industry for forming parts from sheet duralumin, particularly since the development of the Guerin process, patented by the Douglas Aircraft Company. Fundamentally, this process consists of using a block of rubber in the press instead of the customary upper die. Inexpensive lower dies are made from steel, zinc or wood. Sheets of duralumin are placed over the lower dies and the rubber block is brought down so that it engages each die and flows so as to conform to the die contours, producing parts identical in shape with the various dies. When blanking, the pads set up tension between the pressing surface and the periphery of the die, causing the sheet to part along the cutting edge of the die. As many as 35 parts have been formed, or 65 pieces blanked, at one pressing in a hydraulic press of 2,000-ton capacity having 92x72 in. platens. (See also TEXTILE INDUSTRY.) (B. C. B.)

Mackay, William Andrew (1876-1939), U.S. muralist, was born in Philadelphia on July 10 and studied at the College of the City of New York, at the Académie Julian in Paris, and at the American Academy in Rome. During the World War he was a chief district camouflage artist of the U.S. Army. Among his many murals in public buildings, those for the Roosevelt Memorial hall of the American Museum of Natural History in New York city are perhaps the most notable. This work, for which he was commissioned in 1933, depicts various historical scenes in the life of Theodore Roosevelt. Mackay also painted murals for the ceiling of the reading room of the U.S. Senate, for the Civic Opera house in Chicago and for the State building of the New York World's Fair. He died July 26 at New York city.

McMillan, John (1873-1939), British Salvation Army officer, was born at Glasgow, Scotland. His parents, who were also attached to the Salvation Army, were transferred to Canada in 1888. After remaining there for several years in various offices he was ordered to Australia in 1896 and rose to Australian field secretary of the army before his return to Canada in 1916. In 1923 he became chief secretary for the British isles, and three years later he was promoted to commissioner and sent to Chicago as commander of the central U.S. territory, where he remained until 1930. From 1930 to 1935 he commanded the eastern U.S. territory with headquarters in New York city, and in 1935-36 he was in charge of the entire Canadian territory. The next year he was appointed chief of staff to Gen. Evangeline Booth and thus became the head executive officer of the world-wide organization of the Salvation Army. He died at London September 22.

McNaughton, Andrew George Latta (1887-), C.B.; C.M.G.; D.S.O.; born Moosomin (Sask.) February 25; son of Robert Duncan and Christina Mary Anne (Armour); educated Moosomin public school, Bishop's college school, Lennoxville, P.Q., McGill university (1906-1910), B.Sc., 1910, M.Sc. 1912, Senior Demonstrator in Electrical Engineering (1912-1914); Honorary LL.D. 1920; married (Sept. 17, 1914) Mahel Clara Stuart Weir: children, Christina Stuart, Andrew Leslie, Edward Dalzell, Ian Armour, Leslie Stuart. General McNaughton served conspicuously in the World War 1914-1918, during which he commanded in succession the 4th Battery, 2nd Brigade, Canadian Field Artillery; the 21st Howitzer Battery; the 11th Brigade C.F.A.; and next was appointed Counter-Battery staff officer of the Canadian Corps. Wounded at the second Battle of Ypres (April 1915) and again at Soissons (Feb. 1918) he was three times mentioned in despatches, awarded the Distinguished Service Order (1917) and made a companion of the Order of St. Michael and St. George (1919).

Upon returning to Canada in May 1919 General McNaughton was appointed member of the committee for the Reorganization of Military Forces of Canada, and in 1922 promoted to Deputy Chief of the Canadian General Staff. In 1929 General McNaughton was again promoted, this time to Chief of the General Staff, a position which he held until asked to be President of the Canadian National Research Council (1935). He served in this capacity until Oct. 6, 1939, when he was appointed to his present position, Commander of the Canadian Active Service Forces. As head of the National Research Council, in addition to contributing numerous papers to technical journals, he particularly directed research in electrical and aeronautical investigations, and was joint inventor with W. A. Steel of the cathode-ray direction finder. At the close of the year (1939) General McNaughton was "somewhere in England" with the First Division of the Canadian Active Service Force, which arrived in the middle of Dec. 1939. (J. T. C.)

McNutt, Paul Vories (1891-), U.S. politician, was born at Franklin, Ind. on July 19 and was educated at Indiana university (A.B., 1913) and at Harvard (LL.B., 1916). He was admitted to the bar of Indiana in 1914 and began his practice at Martinsville in that State. Three years later he was appointed to the faculty of the Indiana university school of law, and he was dean of this school from 1925 until he resigned in 1933 to assume office as governor of Indiana. In 1928 he was elected national commander of the American Legion. He did not support Franklin D. Roosevelt at the Democratic convention in Chicago in 1932, and he was himself mentioned soon afterward as a possible future candidate for the presidency. In 1937 Roosevelt appointed him U.S. high commissioner to the Philippines. While still in that office he returned to the U.S.A., and on Feb. 23, 1938 his friends staged an elaborate testimonial dinner for him in Washington, D.C. which was widely interpreted as an initial move to secure his nomination as the Democratic candidate in 1940. Some political observers freely predicted an open rupture between McNutt and high officials of the New Deal, but President Roosevelt confounded these prophecies on July 11, 1939 when he appointed McNutt first administrator of the new Federal Security Administration.

McReynolds, Samuel Davis (1872-1939), American legislator, was born near Pikeville, Tenn., on April 16 and was educated at Peoples college, Pikeville, and at Cumberland university, Lebanon, Tenn. Admitted to the bar in 1893, he practiced at Pikeville and Chattanooga and from 1903 to 1923 was a criminal court judge in Tennessee. In the latter year he was elected U.S. representative. Two years later

he became a member of the House committee on foreign affairs and, in 1930, chairman of that influential legislative group. Though he was at first a conservative, he became a staunch New Dealer after the election of President Roosevelt and was noted for his championship of the latter's views on U.S. neutrality. He died at Washington, D.C., on July 11.

Magazines and Periodicals. The outstanding fact of the magazine and periodical business during 1939, as of every other, was the coming of the war in Europe. It brought sharp curtailment both in the numbers and the physical size of English, French and German periodicals, and changes of character both to those periodicals and magazines in America. Paper shortages and increasing costs withered away the German art magazines whose rise had featured the previous year; other publications revealed a pronounced decline in number, in typography, and in circulation. In France and England only the sturdiest magazines survived. Old periodicals like *Illustrated London News* and *L'Illustration* filled up with war articles and war pictures, but became thinner in total pages and lost advertising revenue. *Vu* disappeared in France and across the Channel the digest magazines belatedly echoed their great American popularity of a few years before, headed by *Parade*. In all fields there was a marked tendency toward the tabloid, low-cost periodical.

At the same time black-out nights provoked a curious phenomenon in something like a concerted drive for more reading, with Government approval and support. This was reflected in the wide popularity of the periodical book—reprinted books in paper covers, issued like periodicals, either by subscription or for newsstand sale. A single example of this class, *Mercury Books*, under the auspices of *American Mercury*, had some success in the United States.

In the American periodical field the leading developments exhibited a sharp line of fissure between those produced by the war and those preceding it. Among the pre-war changes may be listed the disappearance of *Ken* after a brief and stormy career, and the fact that *American Mercury*, *Saturday Review of Literature* and *North American Review* all changed hands without any noticeable change in content. *Scribner's*, one of the oldest and most respected names in American periodical history, also abandoned publication. Its title was acquired by a firm which also took over *Commentator*, founded as a kind of cross between the digest and news magazines; and a new publication bearing both titles appeared for the first time in November. The magazine, although not radically different from others of the "quality group," was distinguished by its remarkable format, a portion of its pages appearing on the familiar smooth paper with half-tone illustrations, while the bulk were printed on wood-pulp paper.

Also among the pre-war developments was the startling attrition of the movie magazines, perhaps a reflection of declining interest in the movies themselves, with the time-lag usual between events and the reading habits they induce. The pulp fiction magazines, whose decline was one of the outstanding features of 1938, came back strongly, but with a changed character that perhaps reflected an escape psychology generated by the obviously approaching war. Nearly all the new pulps that attained success were devoted to pure or pseudo-scientific fantasy; and the older pulp magazines showed a strong tendency to increase their content of this type of material. In a somewhat analogous field, paper-bound "books" containing collections of comic strips from the daily press, which in other years enjoyed a mild popularity among children, advanced to the status of full-fledged periodicals

of regular issue, and found thousands of new readers—due apparently to the fact that the strips themselves began to carry their endlessly continued stories into more adult fields of interest. Among the general magazines the coming of the war was marked by a shift of content toward serious non-fiction, dealing not only with European topics but American as well. The picture magazines stabilized at about the point they had reached at the close of 1938. Trade journals generally enjoyed a good year, with large increases among those dealing with aviation. Newsstand sales grew at the expense of subscription circulation. At the close of the year there were 6,432 periodicals being published in the United States, an increase over the previous year; 3,466 of these were monthlies, and 1,399 weeklies, both figures showing gains. (FL. PR.)

Great Britain.—Eleven weeks before the outbreak of war Lord Camrose, chairman of the Amalgamated Press, publishers of the most extensive list of magazines in Great Britain, drew attention to the serious disabilities under which the business was then suffering. The effects of the crisis of Sept. 1938 had not passed away.

In January *Criterion*, a high-class literary quarterly founded in 1922, announced its demise, and this was followed in April by the amalgamation of the *London Mercury*, which, especially when edited by its founder, Sir John Squire, had accomplished much for the literary and artistic world in its 20 years, with *Life and Letters To-day*, a 1s. weekly originally founded by Desmond MacCarthy as a half-crown quarterly, *Life and Letters*, in 1928.

Coming nearer the war, the *Era*, a theatrical weekly with a fine tradition dating from 1837, issued its last number in July, and soon after its outbreak the *Windsor* (1895) and *Pearson's* (1896), monthly magazines, as well as the Cambridge undergraduate journal, *Granta*, did the same. Perhaps the crowning disaster in the magazine world was the disappearance with its December number of the *Cornhill*, which from the time of its founding and editing by Thackeray in 1860 had played a leading part in English periodical literature. Among other suspensions during the year may be mentioned: *United Services Review*; *Modern Motoring* and *Popular Motoring*; *Flying*; *Golf Illustrated*; *Good Gardening* and *House and Garden Design*; *Radio Pictorial*, *Screen Pictorial*, and *Television and Short-Wave World*; the *British Musician* and *Musical News*; *Eve's Journal* and *Salesmanship*. Many others were the subjects of amalgamation, as: *Great Thoughts* (1883) with *Sunday at Home and Overseas* (1854), *Melody-Maker* with *Rhythm*, *Film Pictorial* with *Picture Show*, *Film Weekly* with *Picturegoer*, and *World Radio* with *Radio Times*; while Odham's *Passing Show* and *Weekly Illustrated* were incorporated to form the new and highly successful *Illustrated*. Odham's also during the year took over *News Review*, *Parade*, *Armchair Science*, *Gardening* (which was amalgamated with *Ideal Home*), and *Housewife*, a 6d. pocket monthly launched elsewhere in January.

On the other hand, there were a few newcomers, the war itself, and the preparations therefor, being responsible for some, such as *Battle Training* (a 6d. pocket monthly) some A.R.P. and A.F.S. magazines, and some war serials. The new "Pockets" were led by the already mentioned *Housewife*, and include the *World Digest* (Amalgamated Press), *P.T.O.* (i.e., "People, Topics, and Opinion") (Newnes), *Causerie*, and *Horizon*—all 6d. monthlies. *Tomorrow* is a non-political but democratic 6d. weekly; *Cameo* (Pearson), a 1s. monthly, is a "non-fiction library"; and the *Trident*, which incorporates *Blue Peter* (1921), is a 1s. monthly dealing with the sea and overseas travel. (L. H. D.)

Maginot Line. This stupendous chain of defensive works roughly paralleling the entire sweep of France's northern and eastern frontiers derives its name from

André Maginot, French minister of war who, taking office in 1929 managed to secure, the year following, an appropriation of no less than 2,900,000,000 francs toward its construction.

But its beginnings, at least in the minds of certain far-sighted French soldiers, date from a decade earlier. Studies to determine the type and extent of the new fortifications, construction of which was made imperative by Germany's astonishing post-war military and industrial renaissance, were instituted as early as 1920. In 1922 there was constituted a military commission to consider the problem. Working unofficially, first under the direction of Marshal Joffre and, subsequent to his death, under that of General Guillaumat, it finally received, in 1925, full governmental sanction under a decree signed by Painlevé on the last day of that year. A report which it submitted in 1926 was studied by the Supreme War Council throughout 1927. Finally, in 1928, a few tentative fortifications were constructed in an effort to determine the exact line on which the final works should be built—and the nature of the dispositions required.

Following the voting of the appropriations of 1930, the project was commenced in earnest, its main features being completed in 1934. By this time a line 314km. long had arisen—stretching from the Belgian border on the north to Switzerland on the south, and accenting in particular three defence areas, *viz*: the Rhine, the Vosges and the Metz-Thionville sector.

Subsequently, in order to forestall another German "push" through Belgium, the works have gradually been extended to the north-west along the Franco-Belgian border, and are eventually to reach the sea at Dunkerque. This despite the fact that Belgium has constructed, commencing in 1937, her own "Little Maginot Line" with its southern terminus opposite the French fortifications at Longwy, its northern in a crook or elbow running from Eupen to Liège. The initial appropriation toward this effort was the equivalent of about \$33,000,000 (nearly \$4.50 per capita), a tidy sum for a nation of Belgium's size.

Generally speaking, the Maginot Line comprises a series of concrete pill-boxes, blockhouses and strong points connecting France's old fortifications with two gigantic fortresses, Hackenburg and Hochwald, protecting the great iron and industrial regions of Lorraine. Extending eastward from the works proper are row upon row of obstacles to impede the advance either of man or

machine. These include barbed wire entanglements, concealed dry ditches deep enough to entrap a tank, mined areas, serried rows of steel rails projecting unequally from the ground surface (some of these with bundles of explosives attached to be detonated on impact), canals, moats, in short every known passive means for delaying and neutralizing human or mechanized assault.

The active defence elements are much more inconspicuous. Above ground, there is little to reveal the extent of what lies beneath. Prior to the commencement of hostilities the fortress troops were quartered in innocent-appearing model villages, located close by entrances to the tunnels leading to the hidden blockhouses they now inhabit, the medical service holding that subterranean life, when not imposed by war conditions, was inadvisable. But the buildings were of special construction, collapsible at an hour's notice into small components, these to be overstrewn with camouflage and surrounded in a twinkling by dummy trees capable of passing the closest scrutiny of enemy aviation.

With these habitations razed, the visitor sees little evidence of human occupation. Here and there is a small concrete dome set flat upon the earth, for all the world like an inverted sugar-bowl. From some of these will project the muzzles of guns of various calibres; others will reveal merely the presence of ports through which still additional muzzles will issue should an alarm be sounded. Apart from these, plus an occasional ventilator spout squat upon the ground, identical with the millions adorning chimney-pots the world over—no sign of life exists.

But were we able to cleave with a gargantuan blade some of the innocent-looking hillsides upon which these domes and spouts are perched, we would uncover a series of astonishing human ant-hills piercing the very bowels of the earth with as many as seven layers of tunnels, galleries, shafts and storage spaces. The arrangement of one of these has been described as follows:

(1) Subsurface layer: officers' quarters, men's quarters, motor-generators for air-conditioning and illumination.

Below this we find:

- (2) More men's quarters, more machinery, storage spaces.
- (3) Food storage, ammunition storage, general supplies.
- (4) Clerical staff, telephone exchange, generators.
- (5) Hospital, medical supplies, reserve stores.
- (6) Electric tramway (connecting at various points with main-line railway spurs), map rooms.
- (7) Reserve ammunition, additional machine installations.

From the lowermost levels to the uppermost extend shafts for freight and passenger lifts supplemented by conventional steel stairways. To reach the interior of a cupola from the subsurface quarters, one ascends hand over hand on a steel ladder leading vertically upward through a narrow shaft. Save where pierced by these, a solid concrete ceiling of considerable thickness covers the topmost gallery, itself in turn being overlaid by a heavy stratum of soil, the whole sufficient to render the spaces beneath both bomb- and shell-proof. Within the beehive itself, space is naturally at a premium, though it is so cleverly utilized that the individual soldier can lead quite a comfortable existence. Bunks are double decked; mess tables fold and clamp against concrete walls when not in use. Washrooms are long and narrow, shower-spaces restricted but adequate. Each blockhouse possesses its independent water supply. Food and other stores are on hand in quantities sufficient to withstand an almost indefinite siege despite the fact that the underground railway connections assure ready replenishment from zones to the rear.

What does such a termite colony represent in human effort? The construction of one large blockhouse is said to have involved the excavation of 700,000 cu.m. of earth from the ground surface, and 50,000 more by subsurface mining. Following this, 120,000 cu.m. of masonry were erected. The volume of earth excavated to promote concealment of the entire line was equal to that which would be removed in building a canal from Paris to Bordeaux.

CROSS-SECTION of part of the Maginot Line, drawn by an artist from information released by French military authorities

The zones swept by the collective fire of the guns, if laid end to end, would more than equal the distance from Pole to Equator!

Strategically, the Maginot Line symbolizes *passive* defence, whereas military engineers hold that the Siegfried Line (*q.v.*) was constructed with a defence *based on the counterattack* as the primary consideration. To pierce the former would appear next to impossible, but certain British critics have suggested that in its very strength lies a measure of weakness. For it endows its defenders with such a sense of security that they, being virtually unable to visualize the possibility of a "break-through," have apparently made little effort to plan the measures to be taken should such a calamity befall. Maglione, Luigi (1877–), Cardinal and Papal Secretary of State, was born at Casoria, near Naples, on March 2. After his ordination to the priesthood in 1901, he entered the Papal diplomatic service. In Feb. 1918, he was sent to Switzerland as the special representative of Benedict XV. Through his efforts, a Nunciature was established at Berne and he was appointed first Nuncio. He was consecrated, Sept. 26, 1920, titular Bishop of Caesarea of Palestine. In 1926 he was transferred from Switzerland to Paris, as Apostolic Nuncio to France. Created Cardinal on Dec. 16, 1935, he was recalled to Rome the following year and served on several Congregations of the Curia. On March 11, 1939, Pius XII named Cardinal Maglione as his successor in the office of Papal Secretary of State.

(F. X. T.)

Magnesite. Since the absorption of Austria and Czechoslovakia, Greater Germany heads the list of world magnesite producers, with a total close to 600,000 metric tons; intermediate producers, with outputs of 200,000–100,000 tons, include Manchoukuo, United States and Greece. Yugoslavia, Chosen, India and Australia range from 50,000 to 20,000 tons. Total output from these producers was about 1,100,000 metric tons in 1937. The Soviet Union reported increases in output of as much as 50,000–100,000 tons a year, reaching 482,000 tons in 1934, but these figures are so large in comparison with internal needs and visible exports that they have been received with considerable skepticism in the industry.

Except for the Russian figures, the only material increases beyond the 1929 level have been in Greece, Manchoukuo, and the United States. United States production of crude magnesite was 203,400 short tons in 1937, while sales included 1,950 tons of crude, 10,030 tons of caustic calcined, and 83,200 tons of dead-burned. This domestic supply was supplemented by 35 tons of crude, 2,800 tons of caustic calcined and 56,000 tons of dead-burned in imports, mainly from Austria and China, with smaller amounts from Czechoslovakia and a number of other producers. Production declined by more than half in 1938. British Empire output is comparatively small, being limited in 1937 to 26,200 long tons in India, 19,700 tons in Australia, and 1,500 tons in South Africa, plus an annual output of 25,000–30,000 tons of magnesitic dolomite in Canada. (G. A. Ro.)

Magnesium. Although magnesium metal has been produced on a small scale for a limited number of uses for a long period of years, it is only since 1922 that its real commercial development began. The metal is now used extensively in a wide variety of light metal alloys, and plant capacity and production are expanding so rapidly that it is difficult to determine current outputs. The estimated 1938 output was 25,300 metric tons,

distributed as follows: Germany, 14,100; United Kingdom, 4,000; United States, 2,200; France, 1,800; Japan, 1,400; Switzerland, 800; Soviet Union, 600; and Italy, 400 tons. Practically the entire output is obtained by the electrolysis of magnesium chloride. Plans are under way for the expansion of production in Great Britain, Japan and Italy. (G. A. Ro.)

Magnetic Mines: see BLOCKADE.

Mail-Order Business, a commercial enterprise which carries on its retail transactions almost entirely by mail, and while found in other parts of the world, has reached its highest stage of development in the United States.

The mail-order business had its inception during the era of rapid expansion following the Civil War. Due to geographical reasons, Chicago, Illinois, became the centre of this business, and remains so to this date. Montgomery Ward started in Chicago in 1872, and Sears, Roebuck and Co., now the largest mail-order house, actually started in Minneapolis, Minnesota, in 1887, but moved to Chicago the following year. Other smaller mail-order companies got their start during this same period.

Isolation of farmers due to poor transportation facilities, high literacy of the American public, increased earning power of the masses, inability of local retailers to meet consumer demands, prices charged by local retailers, convenience of the mail-order method, truthful advertising, guarantee of satisfaction, wide selection of merchandise offered by mail-order houses, combined with the popularity of the parcel post system, all were important contributions to the success of the mail-order method of selling.

Although from its inception the mail-order method of distribution met with a measure of success, it was not until the turn of the century that the rapid expansion of mail-order sales got under way. For example, in 1900 the gross sales of Sears, Roebuck and Co. were \$11,000,000; by 1906 they had increased to more than \$50,000,000. Annual sales continued to increase until by the end of 1939 the combined sales of mail-order and retail operations had reached the huge sum of \$657,061,593, the largest in company history. The course of Montgomery Ward & Co., and other mail-order companies to a more or less degree parallels that of Sears.

The increased expansion noted above is to some extent attributable to large quantity purchases and to operating economies peculiar to the mail-order business, both of which have enabled these companies to raise the general standard of living by making more goods available to consumers at a price lower than they would otherwise have paid. Throughout the history of such houses they have obtained their large sales volume by offering, as a rule, better quality merchandise at the same price, or the same quality at a lower price.

Certain tendencies in the mail-order business are becoming more apparent. Examination of current catalogues reveals an increased emphasis upon private brands: *i.e.* upon merchandise manufactured and sold under the proprietary trade names of the mail-order houses. Such merchandise, placed in competition with nationally advertised brands which are also offered in the same catalogue, has found a ready acceptance with the public. Another tendency is seen in greatly increased instalment accounts, which have resulted not from a lowering of credit standards, but by making available all kinds of merchandise to time payment purchasers. For instance, at the close of 1938 the Customers' Instalment Accounts balance of Montgomery Ward had reached the staggering sum of \$65,141,841, while that of Sears, Roebuck and Co. amounted to \$53,987,455.

In the middle of the 1920's, the two largest mail-order houses, commonly known as Sears' and Wards, entered the retail store

field. This new activity was largely experimental until about 1928, when the two companies, apparently believing that they had learned enough about retail store operation to justify considerable expansion in this field, opened retail units in a number of communities. By the end of 1939 Sears' were operating over 500 stores, and Ward's in excess of 600. By this time, too, it was clear that the original function of the two mail-order houses had been modified by the added function of acting as jobbers to their own retail stores, whose sales it is estimated are running over 60% of total sales.

Despite the success of these two companies in the retail store field, the mail-order system is probably the most economical method yet discovered of distributing goods over a wide area. It is not only economical but renders a great service to people living in remote sections of the country. The potential market of the mail-order houses is, therefore, still a large one. An aspect of the business under discussion which is often overlooked is its influence—because of its large purchases—on factory production and employment throughout the country. (See also *MARKETING; RETAIL SALES.*) (J. G. ME.)

Maine, extreme North-eastern State of the United States, admitted as a State in 1820 and popularly known as the "Pine Tree State," has an area of 33,040 square miles. Population (census 1930) 790,182 (estimated 1939, 824,500). The capital is Augusta, 17,198; the largest city, Portland, 70,810. Of the State's population, 292,793 live in the twenty incorporated cities.

History.—In Jan. 1939, Lewis O. Barrows, of Newport, was inaugurated for his second term as governor, having been re-elected in Sept. 1938. In the same month three Republican representatives re-elected in 1938 took their seats in Washington: James C. Oliver, of Portland (first district), Clyde H. Smith, of Skowhegan (second district), and Ralph O. Brewster, of Dexter (third district). Brewster, former governor, later in the year announced his candidacy for the Senate seat to be vacated in 1940 by the retirement of Senator Frederick Hale. Governor Barrows announced his intention to campaign for the same position. Several Republicans and one Democrat prepared to fight for the governorship in 1940. Maine's legislature, meeting in regular biennial session, pondered tax reform, but decided to continue the State's narrow tax base, depending largely on auto, gasoline, liquor and real estate levies. Proposals for an income tax law failed of passage, as in previous years. No major bills were passed; the Department of Health and Welfare was reorganized and a host of minor bills and amendments were approved. Several municipalities were granted the right to adopt the manager form of government. Dog racing, lottery and liberal old age pension bills were killed. A proposed constitutional amendment increasing the State debt limit to permit additional highway bonds was defeated by the voters in Sept. 1939. Old age assistance appropriations were increased without passing any major tax bills. Part of the money was found by cutting other appropriations, part by assessing the cities and towns for one-fourth of the cost, an equivalent sum being returned to localities for local road work from gasoline tax revenues. Unable to meet payments from regular revenues, the State dipped deep into the sinking fund reserve. The percentage of persons 65 years of age and older is larger in Maine than in all but one or two States. According to 1930 figures there were 69,010; by 1939 the number had increased, but no definite figures were available. By Dec. 31, 1939, approximately 28,165 of this age group had applied for old age assistance; 13,977 had been granted aid, and the monthly payment averaged \$20.64. However, in spite of financial difficulties, the governor stated that a special session of the legislature would not be needed in 1939. In late December the *Bangor Daily News* published a series of front page stories with accom-

panying tables purporting to show irregularities in the transfer and accounting procedure of the State, and ridiculing claims of a balanced budget. Political sabotage and inadequate funds seemed to critics to prevent effective operation of the (1937) merit system act.

Education.—Maine continued to be low in its expenditures for rural schools compared with a majority of States. The legislature re-enacted the \$200,000 annual "equalization fund" which has relieved the situation somewhat since 1937.

Charities and Correction.—The population of State institutions for criminals and mental patients continued to increase and existing buildings remained inadequate, but the legislature of 1939 provided no money for new construction during 1939-40.

Banking and Finance.—Savings bank deposits continued at high levels during the year 1938, while interest rates were somewhat above those in Boston and New York and varied widely within the State.

Agriculture and Manufactures.—Maine continued to lead the potato States with 1939 production lower than the average. Estimated income was about the same as in 1938, but not over half the amount of the peak years, 1929, 1936. Estimated yield in bushels: 1938, 39,600,000 (figure revised, 1940), 1939, 38,250,000. With Federal assistance, timber owners salvaged much of the timber blown down in the 1938 hurricane, and expected to receive higher prices than usual. General business conditions, following national trends, were better than in 1938. The tourist trade topped the previous year, yet was below 1937. Gasoline taxes reached new high levels. Unemployment compensation payments decreased substantially from 1938. The State employment service registered fewer persons than in 1938, but increased the proportion of placements, especially in private business. As the year closed, official estimates showed 325,000 social security numbers issued in Maine, as compared with the estimate a year ago of 293,556 (corrected figure 289,308). WPA rolls indicated a drop of 40% from 1938. (E. F. D.)

Malacca: see STRAITS SETTLEMENTS.

Malaria. Malaria has spread following in the wake of the spread of the mosquito *Anopheles gambiae* in the northern part of South America. This mosquito was formerly found only in Africa where it was recognized as the most efficient vector of malaria in the whole world. In 1930 it was discovered at the port of Natal in northern Brazil, having been introduced apparently by ship or aeroplane from West Africa. Soon after its discovery in Natal, the city suffered the most severe outbreak of malaria in its history. The following year the mosquito had travelled more than 1000 mi. up the coast, and in 1938 had doubled its distance of travel and caused over 50,000 cases of malaria in the State of Ceará, Brazil.

In certain districts 10% of the population died and agriculture was ruined because of lack of labour. This mosquito is especially dangerous because it is easily infected with malaria; it prefers to bite man rather than animals; and it prefers to live indoors and may even breed there. It also flies farther than most *Anopheles*. Probably this mosquito will soon invade the river valleys of northern Brazil. If it does, it will probably be beyond control and will eventually invade Central America and possibly North America. For this reason, the Rockefeller Foundation appropriated \$100,000 and the Brazilian Government an additional large sum in order to attempt to stop the advance in 1939.

In the United States, malaria is continuing a downward trend for the sixth consecutive year. This is longer than in previous natural cycles of the disease, but it is not yet known whether it

is due to unfavourable breeding conditions because of the drought in the latter part of the summer of 1939 or to the extensive drainage of breeding places which has been continued with the help of the Federal relief agencies. The only unfavourable circumstance reported in the United States is the continued occurrence of highly fatal malaria among morphine and heroin addicts. These addicts transfer malaria from one to another by hypodermic needles used for the intravenous injection of their drug, dividing a large dose among several persons and transferring a little blood from one to another.

Advances have been made during the year 1939 in our knowledge of the immune reactions in malaria. The complement fixation test, described in 1938 for monkeys, is applicable to man, using monkey malaria parasites for the test. This demonstrates antibodies in the blood serum of the infected individual and may be of assistance in the diagnosis of obscure cases. It has also been shown that agglutinins appear in the blood of infected monkeys, which will cause clumping of the parasites causing the infection. Protective antibodies have also been demonstrated in the blood serum of monkeys which have recovered from the acute infection. This serum, when injected into fresh monkeys which usually die of the infection, prevents a fatal outcome. The complement fixation antibodies can be produced by killed malaria parasites but the agglutinins and protective antibodies can be produced only by the living parasites.

The only significant advance in the treatment of malaria is the discovery that sulphanilamide will cure monkeys infected with the parasite *Plasmodium knowlesi*, although it has no effect on another monkey parasite, *P. inui*, and little if any effect on the malaria parasites of man. It was found that the effect of the drug on *P. knowlesi* is associated with a cessation of the use of oxygen by the parasite, and it is believed that this test, which is a simple one, may be used in the search for other anti-malaria drugs.

In the southern United States, *Anopheles* breeding places have been studied in minute detail to determine the relation of plants, microscopic animals, light and various degrees of acidity and alkalinity of the water to the development of the larvae. This is done in the hope that some simple method may be found of making water unfavourable for the development of the mosquito.

During the last decade a number of varieties of the species *Anopheles maculipennis* have been discovered, some of which bite man and transmit malaria, and others of which do not. Attempts to cross these varieties by interbreeding have been unsuccessful, indicating that there is little danger of one variety changing into another and thus acquiring the ability to transmit the disease. Attention is now being directed by the Rockefeller Foundation to malaria in Egypt where it presents problems quite different from those in Europe and where the problem is different in the Nile delta from that in the oases of the desert.

In India, extensive studies of the conditions responsible for the occurrence of malaria have been continued, indicating that much of the problem is the result of man-made breeding places which could be eliminated by intelligent engineering and agriculture. Vast irrigation projects for the cultivation of land during the past century, and even in recent years, have been developed with such disregard to malaria prevention that unnecessary *Anopheles* breeding places have been produced and malaria has been tremendously increased as a result.

Malaria control has advanced steadily in the southern United States through the extension of studies, screening, and permanent drainage conducted by various State and local health departments. The most noteworthy advance has been in the construction of drainage ditches lined by concrete inverts with side walls of concrete, stone or sod. In Mississippi alone since 1933 malaria control drainage has been carried on with the help of Federally subsidized

labour in 225 towns in 76 counties and has affected more than 600,000 people or approximately one-third of the population of the State. Since 1936, when concrete ditching was started, 114 mi. of such ditches have been constructed. This is an illustration of what can be done by co-operation of national, State and local agencies. The control of *Anopheles* breeding around the lakes created by the Tennessee Valley Authority has continued to be satisfactory and methods have been devised to reduce its cost. The greatest problem in this area will be created by the completion of the Gilbertsville dam when extensive areas of Tennessee and Kentucky will be flooded and where the relatively flat nature of the land will make the control of breeding much more difficult.

Malta: see BRITISH POSSESSIONS IN THE MEDITERRANEAN.

Manchoukuo (MANCHURIA), an Empire, closely connected with Japan, located in north-eastern Asia, bounded on the north and east by Siberia, on the west by Siberia, outer Mongolia and China proper, on the south-east by Korea. Its capital is Hsinking; its ruler the Emperor Kangle.

Area and Population.—The area is 460,383 sq. mi.; its population (June 30, 1936) 33,836,898, including about 700,000 Koreans, about 230,000 Japanese, about 50,000 white Russians and some 3,500 foreigners of other nationalities, among these 434 British, 439 Germans and 226 Americans. Population of chief cities: Hsinking (1936) 307,602; Harbin (1936) 462,602; Mukden (1936), 534,638; Antung (1936) 166,238.

History.—The League of Nations passed a resolution recommending non-recognition of Manchoukuo; and for six years after its establishment Japan and the Central American Republic of El Salvador were the only countries to extend *de jure* recognition. Italy recognized Manchoukuo on Nov. 30, 1937; and Germany maintains a special trade representative in Hsinking. In 1938 Germany extended full recognition, and Poland *de facto* recognition to Manchoukuo. The United States and Great Britain maintain consulates in Mukden and Harbin; and their consuls deal with the established authorities on an informal basis.

Education and Religion.—As of June 1938, there were 16,002 elementary schools (1,422,386 pupils and 33,505 teachers); 137 secondary schools (14,835 pupils and 1,959 teachers) and seven colleges (1,765 students and 228 teachers). Illiteracy is very high, especially in the country districts. The principal religions are Buddhism, Taoism, Mohammedanism and Lamaism. There are about 100,000 Christians in the country.

Armed Forces.—Besides the Kwantung army, the size of which is kept secret, Manchoukuo maintains an army of 80,000 and a flotilla of 15 gunboats, a destroyer and 6 patrol vessels.

Finances and Banking.—The unit of currency is the Manchoukuo yuan, equivalent in value to the Japanese yen (23.65 U.S. cents). The budget, which has been increasing in size, amounted to 420,454,000 yuan in 1939. The Central Bank of Manchoukuo controls the note issue; the Industrial Bank of Manchoukuo specializes in crediting industrial enterprises; and there are a number of other Japanese and Manchoukuo banks.

Trade and Communications.—Manchoukuo's exports and imports in 1937 were valued at 645,297,656 yuan and 887,411,696 yuan respectively. Japan supplied 627,229,748 yuan worth of imports and purchased 277,087,993 yuan worth of exports. Manchoukuo's exports amounted to 725,454,000 yuan in 1938, while

imports were valued at 1,274,748,000 yuan. In this year Japan supplied over 80% of Manchoukuo's imports (993,413,000 yuan) and purchased almost 60% of its exports (416,825,000 yuan). Manchoukuo has about 6,000 mi. of railway lines, of which about 2,000 were constructed after the creation of the new State. The principal towns are connected by a regular commercial air service.

Agriculture, Natural Resources, Manufactures.—Manchoukuo's most important crop consists of soybeans. Kaoliang, millet corn and wheat are also produced in substantial quantities, together with small amounts of rice, cotton and tobacco. In 1937, Manchoukuo produced 4,200,000 tons of soybeans (value 273,000,000 yuan); 4,441,690 tons of kaoliang (value 266,501,400 yuan); 3,451,000 tons of millet (value 189,805,000 yuan); 2,261,000 tons of maize (value 128,877,000 yuan); 1,156,300 tons of wheat (value 115,630,000 yuan). The effect of Japan's war economy became much more pronounced in Manchoukuo during 1938 and 1939. There was an almost inflationary rise in prices; an actual shortage of labour developed; the peasants showed a tendency to hold back goods from the market. There was an effort to push through a five year plan of industrial production (supposed to run until the end of 1941) with a view to increasing the output of the mining and machine-building and chemical industries. While some increases in production were registered there were considerable difficulties with supplies of raw materials and of trained labour personnel, and the term of the plan has been extended to 1943.

Mandated Pacific Islands: see PACIFIC ISLANDS, MANDATED.

Mandates. During 1939 the Permanent Mandates Commission met in June and December. In June it examined annual reports from South-West Africa, New Guinea, French Togoland, Nauru, Palestine and Syria. Little comment was forthcoming on the complete pictures presented of the economic, political and social life of the inhabitants of these areas, save in the case of the final two. In Togoland the commission noted the discouragement of transfer of land to Europeans, and it recommended further examination of labour conditions in New Guinea. But Palestine presented a major problem. With the report was the British *White Paper* of May, proposing to terminate the Mandate after 5 years, during which 15,000 Jews might immigrate a year, but after which the British Government would not support development of the Jewish Home, if the Arabs objected. The commission concentrated on the *White Paper*, which, in its unanimous opinion, was not in accord with the interpretation which, in agreement with the Mandatory Government and the Council, the commission had always placed on the Mandate. Proof offered was the British statement of 1937 that the Mandate was unworkable. If it was now

Mandated Territories

Territory	Area	Date of Mandate	Mandatory Power	Former Title	Former Administration
<i>South-west Africa</i> , including Caprivi Zipfel, formerly part of Bechuanaland protectorate.	317,725 sq.mi.	Dec. 17, 1920	Union of South Africa	German South-west Africa	German Empire
<i>Togo</i> , comprising: (1) Togoland, i.e. western section, excluding the seaboard. (2) Togo, i.e. eastern section and seaboard	13,040 sq.mi. 20,000 sq.mi.	July 20, 1922	Great Britain France	Togo	German Empire

JOHN BULL blundered into Palestine "without benefit of trumpets" in 1939, according to Elderman of *The Washington Post*, and was criticized therefor by the League of Nations' Permanent Mandates Commission

workable, a new interpretation must be found. Here unanimity ended. A majority of the commission said the *White Paper's* policy was in accord neither with the terms of the Mandate nor the authors' intentions; and criticized the safeguards for the Jews, the proposals regarding the Constitution and the policy of land settlements and immigration as contrary to Article VI of the Mandate. A minority thought existing conditions could justify the policy, if the Council did not object. The British Government issued a reply not accepting the view of the majority. As the commission is advisory, decision on the question of mandatory policy in Palestine rests with the Council, which however did not meet for this purpose during 1939.

In Syria and the Lebanon the commission approved progress in local administrative autonomy and official measures for centralization and unification, but noted that in places treatment of minorities was not in full accordance with the Mandate. It regretted that the 1936 Franco-Syrian Treaty was still unratified. As the report was silent about the Sanjak of Alexandretta, international considerations apparently overriding the scope of the Mandate, the commission could exercise no supervision.

In December the commission examined reports from Western Samoa, British Cameroons and Togoland, Tanganyika, French Cameroons, and Ruandi Urundi. Japan's report on the Pacific Islands did not arrive. The commission noted British measures encouraging natives to take part in their own administration and safeguards of native interests provided in the demarcation of the frontier between British and French Cameroons. Conditions generally were satisfactory, efforts being made to protect the areas from the consequences of the war. (M. F.E.)

Manganese.

World manganese production in 1937 rose to a new record figure, estimated at 6,000,000 metric

tons, but declined about 6% in 1938. The status of the leading producers is shown in the accompanying table below. The feature of the manganese industry in recent years has been the rapid rise of South Africa from a minor producer to third rank, following the Soviet Union and India; production to the end of Aug. 1939 was 12% below the 1938 level. Gold Coast at the mid-year was well below 1937 while Brazil and India were a bit ahead. No production information is available from the Soviet Union, but exports have dropped heavily; Russian exports through Oct. 1938, the latest available, were only 324,600 tons. Another point of interest brought out by these figures is the status of the Russian output; the Soviet Union is the only important producer which is also a consumer on any appreciable scale, and since production and consumption by minor countries approximately balance, this means that, roughly speaking, the difference between the total output and the total consumer imports for any year is an approximate measure of the amount of the Russian output that has been retained within the country. Since 1934 this amount has been far in excess of any possible demand of the local steel industry, indicating that large amounts are being held in stock.

World Production and Imports of Mongonese Ore

Difference	805	376	2,958	2,700	?

Partial figures for 1939 indicate a continued heavy decrease in demand in all of the leading consuming countries except the United States, where imports were 20% above the 1938 level, though still far below those of 1936 and 1937. Imports during the first half of 1939 were almost a half less than in 1938 in Belgium, France, and Germany, 20% less in Norway but only about 10% less in Great Britain. Receipt of later data has been hampered by war conditions, and it may be that full information will not again be available until peace is established. (See also METALLURGY.)

(G. A. Ro.)

Manitoba, mid-continent Province of Canada and the oldest and most easterly prairie Province; area: 246,512 sq.mi. (26,789 sq.mi. water); population (census of Manitoba, June 1936), 711,216; urban, 310,927, 44%; British racial origin, 362,389; Ukrainian, 86,982; German, 52,450; French, 47,683; Polish, 35,136; Scandinavian, 21,504; Dutch, 25,521; others, 66,210. Total Canadian-born, 508,300, 70%. Capital, Winnipeg, population (Nov. 1939), 222,454.

History.—The present legislature of Manitoba consists of 55 members, with the Government headed by Hon. John Bracken, premier since 1922.

The lieutenant-governor is Hon. William J. Tupper. Manitoba elects 17 members to the House of Commons of Canada, and has six representatives in the Senate.

Education.—Public, elementary and secondary schools are maintained by general taxation, with the Manitoba university, including a faculty of agriculture, and affiliated colleges, providing for higher education. There are also several other colleges and schools. Pupils in elementary grades, 117,430; in secondary, 21,899. Full-time students enrolled in university, 2,642.

Banking and Finance.—Winnipeg, financial centre of Western Canada, is western headquarters of eight of the 12 Canadian banks, and of insurance, mortgage and financial institutions.

Agricultural, Mineral, Manufacturing, Other Production.—Total value of crops in 1938, \$87,463,000; manufactures, \$140,805,000; mineral production, \$17,175,000; fisheries, \$1,735,000; furs, wild catch, \$669,535; fur farms, \$320,440; processed in Winnipeg, \$376,068; f.o.b. Winnipeg, including furs from other Provinces, \$2,899,914. Canadian Pacific railway mileage, 2,697; Canadian National, 2,965; Midland, 90; Greater Winnipeg Water District operates 110. Highways, including Trans-Canada, 1,731mi. (gravelled, 1,308; bituminous surfaced, 410; concrete surfaced, 13). Province-owned telephone system has 78,236mi. of wires, also 25,000mi. of toll wires for long distance use. Total of phones in Province, 68,931. (W. J. HE.)

Mannerheim Line: see EUROPEAN WAR; FINLAND.

Maple Sugar. Maple products in the United States were materially reduced in 1939 by a poor season and the loss of trees in the Sept. 1938 hurricane. Only 9,670,000 trees were tapped in 1939, compared to 11,672,000 in 1938 and a ten-year (1928-37) average of 12,390,000. The United States maple sugar crop in 1939 was 715,000lb. compared to 1,078,000lb. in 1938 and a ten-year average of 1,548,000 pounds. Syrup was 2,447,000gal. in 1939, and 2,772,000gal. in 1938, the ten-year average being 2,628,000 gallons. In Quebec, 1939 production was 2,715,400lb. of sugar and 1,810,400 imperial gallons of syrup. The 1938 production was 3,212,000lb. of sugar and 2,354,000 imperial gallons of syrup.

U. S. Production of Maple Sugar and Maple Syrup by States

	1939	1938	Ten-year average
	lb.	lb.	lb.
Maple Sugar			
New York	290,000	260,000	378,000
Vermont	279,000	627,000	789,000
Pennsylvania	43,000	45,000	100,000
Massachusetts	30,000	35,000	78,000
New Hampshire	24,000	72,000	88,000
Michigan	17,000	16,000	34,000
Maryland	10,000	10,000	21,000
Ohio	9,000	9,000	32,000
Wisconsin	7,000	3,000	20,000
Maine	6,000	6,000	27,000
Maple Syrup			
	gal.	gal.	gal.
Vermont	843,000	1,485,000	1,002,000
New York	714,000	588,000	736,000
Ohio	370,000	283,000	337,000
Pennsylvania	129,000	95,000	192,000
Wisconsin	105,000	49,000	65,000
Michigan	104,000	64,000	110,000
Massachusetts	64,000	52,000	57,000
New Hampshire	59,000	83,000	72,000
Maryland	25,000	26,000	23,000

(S. O. R.)

Marble and Granite. The production of marble in the United States in 1938 declined slightly to 89,900 short tons, valued at \$4,473,000, two-thirds of which was building stone and one-third monumental stone. Most of the crushed or broken marble sold is waste from the dimension stone branch of the industry; this increased by 16% in 1938, to 130,400 short tons, valued at \$275,200. Canadian production of

marble is small, 18,900 short tons in 1938, a decline of 13% from 1937. Marble production in Great Britain is not of commercial importance, most of the supply being imported.

Granite.—The United States production of granite as dimension stone in 1938 decreased by 10% from 1937, to 672,600 short tons, valued at \$9,778,000; 58% of this was building stone, 22% monumental stone, 5% paving stone, and 10% kerbing; production as crushed or broken stone increased by 15% over 1937, to 9,760,000 short tons, valued at \$11,137,600; 68% of the total was for concrete aggregate or road metal, and 17% as railroad ballast; riprap, which constituted 46% of the 1936 total, was 14% in 1938. Canadian production of granite decreased by 57% in 1938, to 491,400 short tons, valued at \$1,126,400. Production of granite in Great Britain is reported along with other types of igneous rocks, increasing in 1937 by 5% to 10,470,000 long tons, valued at £3,267,000; 91% of the total was used for road metal or ballast.

(G. A. Ro.)

Mariani, Domenic (1863-1939), Italian cardinal, was born at Posta, in the province of Rieti, on April 3. He prepared for the priesthood in Rome and served in various administrative posts under Leo XIII, Pius X, Pius XI and Pius XII. Pope Pius XI created him cardinal in the consistory of Dec. 1935. He died at Vatican City on April 23.

Marine Biology. It is a paradox to find biologists stressing as never before the conservation of life while the war-lords pound away at its destruction. Even while hostilities were brewing, science congresses¹ were in progress to find ways and means of conserving marine forms. Coincident with the outbreak of war in Europe, the Seventh Triennial Assembly of the International Union of Geodesy and Geophysics² was called into session at Washington, D.C., by President La Cour of Denmark, to discuss problems related to the earth's crust, its oceans and its atmosphere, while from Bergen, Norway, came the announcement of the meeting of the International Exhibition for Polar Exploration³ and a conference of polar explorers to be held there in 1940. What the ultimate effect of war will be, cannot be predicted, but already the Dundee meeting of the British Association for the Advancement of Science⁴ has been cancelled, and the projected meeting at Newcastle-on-Tyne has been indefinitely postponed. It seems certain that if protracted, the war will not only draw upon the most competent marine researchers, but will disrupt many programs under way.

Several exploratory expeditions have been initiated, or progress of their scientific work has been reported. The U.S. Government Antarctic Expedition to Little America under the direction of Admiral Richard E. Byrd (Rtd.) is under way, and will extend over a three-year interval, exploring the Antarctic continent and its adjacent waters. The "North Star" left Boston in the middle of November of 1939, taking with it the huge snowmobile, the "Penguin," which is calculated to take the place of dogs and sleds. The barkentine "Bear" will join the "North Star" at the Bay of Whales early in January.

The U.S. Coast Guard cutter, "Hamilton," which was to have sailed from San Francisco in Sept. 1939 with 18 scientists aboard to make an extended study of the island-studded central and south Pacific under the joint sponsorship of the National Geographic Society and the University of Virginia, has been ordered to patrol duty in Atlantic waters.

¹One of the symposia of the Pacific Division of the American Association for Advancement of Science was devoted to conservation problems of migratory fish. *Science*, p. 504 (June 1939). Another program of the Pacific Science Congress held in Berkeley, Calif., had several technical sessions devoted to oceanography and marine biology. See *Science*, p. 454 (Nov. 1939). ²*Science*, p. 339 (Oct. 1939). ³*Science*, p. 136 (Aug. 1939). ⁴See pessimistic note, "The British Association in War Time," *Science*, p. 387 (Oct. 1939). ⁵For features of the forecasted trip see *Science*, p. 173 (Aug. 1939), and for notice of postponement see *Science*, p. 436 (Nov. 1939).

However, the U.S. Geophysical Expedition⁶ to the south-west Pacific, north-east of New Zealand, is under way with its physical and biological program to survey an area of 4,500,000 square miles. The second Fahnestock expedition⁷ to the South Seas, to collect habitat groups for Whitney Memorial Hall of the American Museum of Natural History left New York in the auxiliary schooner "Director II." The all-steel cruiser, "Valero III," of the University of Southern California completed its eighth trip into the southern waters of the eastern Pacific, returning with quantities of rare sea-forms for taxonomic work, and several specimens of the nearly extinct elephant-seals from San Benitos and Guadalupe islands which were donated to the San Diego zoo.

The Committee on Pacific Investigation of the National Research Council of Japan⁸ has proposed extensive studies of the fishes and mammals of the north Pacific ocean. Cambridge university⁹ has initiated a biological expedition to Jamaica to study the topography and life forms associated with the adjacent areas. The British Museum has released Part I of the report of the Great Barrier Reef Australian Expedition which treats of rock-destroying molluscs, zooplankton, copepods, and crustaceans of the region surveyed. The museum also has released a report of the John Murray Expedition of 1933-34 dealing with oceanographic and biological surveys of the Indian ocean and the Gulf of Aden. Detailed reports of many forms will interest the biologist. The new 700-ton non-magnetic ship "Research," to take the place of the "Carnegie," was launched by the British Admiralty¹⁰ on April 4, 1939, and a similar ship of 800-tons displacement is reported to be under construction by the Soviet Government. When completed, the ship will be commissioned for research in the Arctic ocean.

The new 100-ton oceanographic vessel, the "Culver," sponsored jointly by the Development Commission of Great Britain and the Royal Society of London¹¹, entered upon its five-year study program of the Gulf stream using the Bermuda Biological Station as its base, and co-operating with the "Atlantis" of the Woods Hole Oceanographic Institute. The research project involves a dual

program consisting of physico-chemical studies and the extensive biological survey of the stream. The U.S. Bureau of Fisheries¹² announces the commissioning of the "Harvard" to take the place of the "Albatross II," for some time out of service. It will aid in solving commercial fishing problems off the Georges and Nova Scotian Banks. The German State Biological Institute¹³ at Heligoland is investigating the possibility of harvesting the minute organisms (plankton) of the seas to serve as a source of food for man. While it is known that the zooplankton content of sample catches (mostly copepods) has a nutritive value of good meat, and the phytoplankton (plant) the content of good rye flour, it seems doubtful if the undertaking would be a success on a large scale, since it would require the recovery of all plankton from 7,500 cu.m. of sea water to furnish the food-equivalent of the dietary of a man for a single day. On this basis, workers at the Woods Hole Oceanographic Institute conclude, that either richer yield must be discovered or some method be found to increase the catch before it could be of economic or practical value.

A new Biological Research station has been made available by the South Wales Government at Cronulla.¹⁴ Three new U.S. Bureau of Fisheries laboratories have been established; one at Pensacola, Fla., taking over the abandoned quarantine station on Ballast Rock island; another at the cross-roads between North and South America in Puerto Rico, where at an initial cost of \$25,000, special studies in fish preserving and marketing problems are being initiated. A third Government station is located at Milford, Conn., where in a new specially designed building, research work will be conducted on the propagation of oysters and other commercial molluscs.

A worker in the Carnegie Geophysical Laboratory,¹⁵ using a deep-sea dredge of new design, has obtained mud-samples ten feet in thickness from the sea-floor two miles down in the Atlantic. He concluded that there were four ice-periods; five warm water eras; that the magnetic pole has wandered widely as evidenced by small magnetic particles still pointing in the direction they did thousands of years ago, and that strange gigantic shelled animals dominated one era of the earth's past. Another worker, at the Marine

⁶See *Nature* (July 1939). ⁷See *Science*, p. 437 (Nov. 1939). ⁸See *Nature* (July 1939). ⁹*Nature* (July 1939). ¹⁰*Nature* (March 1939). ¹¹*Science*, p. 29 (Jan. 1939).

THE DISCOVERY OF A LIVE COELACANTH, supposedly extinct for more than 50,000,000 years, off South Africa in Dec. 1938 was described on March 16, 1939, by a jury of British scientists as "one of the most amazing events in the realm of natural history in the 20th century"

¹²*Science*, p. 227 (Sept. 1939). ¹³*Science*, p. 602 (June 1939). ¹⁴*Nature* (Aug. 1939). ¹⁵*Science*, p. 48 (Feb. 1939).

Station at Naples,¹⁶ has successfully isolated "fertilizin" from sea-urchin eggs, an active principle of all fertilization processes. Concerning the direction of some interesting adaptations, a worker in the U.S. Bureau of Fisheries¹⁷ has found that certain fishes and other organisms which usually are found only in salty Atlantic waters, migrate through the locks of the Panama canal and apparently live successfully in the brackish waters of Gatun lake. Some Atlantic forms have even been recovered on the Pacific side. In all, 159 species have been identified, some of which, however, make poor adjustments involving both temperature and salinity changes.

The U.S. Academy of Science award, the Agassiz medal for 1938, goes to the outstanding marine biologist and oceanographer, Harald Ulrik Sverdrup, now director of the Scripps Institute of Oceanography. He is a Knight of St. Olaf, and a member of the Academy of Science of Oslo.

We are reminded¹⁸ that while we associate the penguin with the ice and snow lands of the polar regions they abound in the warmer climes. Thus they are found in innumerable quantities on the islands along the South African coast where they fish and rear their brood along the waters of the warm southern Atlantic ocean. Marine Corps. an integral part of the U.S. Navy, is organized and trained on military lines to fit it especially for duty in the naval service both at sea and ashore. The corps dates from Nov. 10, 1775, when it was authorized by the Continental Congress, and consists of 1,220 commissioned officers, 150 warrant officers, 26,000 enlisted men.

The ranks of officers correspond to those of the Navy, but the titles are those of the Army, from second lieutenant to major general. Marines, 275 officers and 8,000 enlisted men, garrison 36 shore stations, 24 within continental limits and 12 overseas, and 135 officers and 3,200 enlisted serve as part of the crews of 60 sea-going battleships and cruisers of the Navy. The fleet marine force is organized, equipped and trained for service with the sea-going fleet, acting as a landing force to seize, defend and maintain temporary bases that the fleet will require in overseas operations. This force accompanies the fleet on manoeuvres assimilating war conditions. The two brigades of the fleet marine force consist of infantry, artillery, aviation, anti-aircraft batteries, chemical companies, engineer companies and tank companies; total peace strength 320 officers and 6,000 enlisted.

During 1939 an important mission of the Marine Corps was the protection of American lives, interests, and property in China during the Japanese attacks upon China. The U.S. Embassy guard, at Peiping, 20 officers and 500 enlisted, has been maintained in accord with treaty stipulations since the Boxer Rebellion of 1900. In addition to the Embassy guard, a marine regiment, 70 officers and 1,500 enlisted men, has been on temporary duty at Shanghai.

The 20 aircraft squadrons of the Marine Corps, 200 officers and 1,500 enlisted men, form part of the fleet marine force. They are based on marine barracks, Quantico, Va., naval air station, San Diego, Calif., and St. Thomas, Virgin Islands, and move with the fleet base force as required by the needs of the U.S. fleet.

Officers are commissioned from graduates of the Naval academy and distinguished military colleges, and from qualified enlisted men.

The Marine Corps Reserve consists of 1,000 officers and 16,000 enlisted, including aviation units of 212 officers and 1,000 enlisted, based on 15 stations and trained regularly to fit them for assignment to regular duties in time of war or emergency. (D. W1.)

Marine Insurance: see INSURANCE, MARINE.

Market Gardening. A record acreage of vegetables, or commercial truck crops, for fresh marketing was harvested in 1939 in the United States, 1,747,000 ac., or about 1% more than the acreage of 1938. Commercial market gardening in the United States has increased by about 440,000 ac., or 34%, in the years 1930-39. All data herein are from reports of the U.S. Department of Agriculture. Production of vegetables in the United States for fresh marketing was the second largest on record in 1939 and only slightly under the all-time-high production of 1938. The decrease in production was mainly because of smaller harvests of cabbage and watermelons. On the other hand, such higher-price crops as asparagus, snap beans, cauliflower, eggplant, lettuce, onions, green peas and peppers reached a new high of production in 1939. The index of production of these higher-priced crops, based on 1924-29 averages, was about 3.5% above that of 1938, or 149.4 of the 1924-29 average and an increase of 27% in the years 1930-39. Prices for these special crops were also higher in 1939 than in 1938 owing to improved consumer buying power, the increase being 7%, which brought the price to 69.8% of the 1924-29 average. Commercial production of principal vegetables in the United States for fresh marketing in 1939, in 1938 and the ten-year (1928-37) average was as follows, excluding potatoes and sweet potatoes:

	1939	1938	1928-37
Asparagus	6,887,000 crates	6,099,000 crates	5,195,000 crates
Beans (snap, green and wax)	16,580,000 bu.	15,107,000 bu.	11,307,000 bu.
Beans (lima)	1,100,000 bu.	904,000 bu.	651,000 bu.
Beets	2,021,000 bu.	1,999,000 bu.	1,899,000 bu.
Cabbage	989,200 tons	1,296,000 tons	925,200 tons
Cantaloupes	14,402,000 crates	14,973,000 crates	14,962,000 crates
Carrots	16,061,000 bu.	16,068,000 bu.	11,587,000 bu.
Cauliflower	8,422,000 crates	8,401,000 crates	6,993,000 crates
Celery	11,327,000 crates	11,868,000 crates	9,123,000 crates
Corn (New Jersey)	114,400,000 ears	110,250,000 ears	116,090,000 ears
Cucumbers	4,656,000 bu.	4,595,000 bu.	4,153,000 bu.
Eggplant	1,092,000 bu.	961,000 bu.	801,000 bu.
Kale (Virginia)	550,000 bu.	514,000 bu.	619,000 bu.
Lettuce (g.i.)	24,066,000 crates	19,676,000 crates	19,433,000 crates
Onions	17,479,000 sacks	15,038,000 sacks	13,797,000 sacks
Peas	9,627,000 bu.	8,505,000 bu.	7,359,000 bu.
Green peppers	5,066,000 bu.	4,970,000 bu.	3,900,000 bu.
Shallots (Louisiana)	674,000 bu.	490,000 bu.	..
Spinach	13,439,000 bu.	12,559,000 bu.	12,472,000 bu.
Tomatoes (g.i.)	24,585,000 bu.	24,724,000 bu.	18,707,000 bu.
Watermelons	65,604,000 melons	72,175,000 melons	68,019,000 melons

(S. O. R.)

Marketing. The wholesaler-retailer system continues as the channel through which nearly three-fourths of all consumer goods reach the public. The direct distribution systems including the department stores, mail-order houses and chain stores have similarly held their own not only in volume of sales but in the service rendered to the consuming public. Through competition they still set the pace in regulating prices and conditions of purchases. The super-market, the department store of the food trades, is the most spectacular development in distribution of the years 1935-39.

To meet the competition of the chains and the super-markets, retailers who buy from wholesalers, both in co-operation with and in many cases without such co-operation, have organized retailers' co-operatives and "voluntary chains" as aids to buying advertising, and other functions. The retailers' co-operatives and voluntary chains now have more units than the corporate chains.

Consumers' co-operatives, an important factor in the distribution of goods in several European countries, are still insignificant in the United States in volume of business transacted, although public interest in this form of distributive ownership and control

¹⁶Science, p. 177 (Aug. 1939). ¹⁷Science, Supp. 8 (Aug. 1939). ¹⁸See an account of these peculiar birds in *Nature Magazine* (Nov. 1939).

seems to be growing. House-to-house selling as a channel of marketing has always been and is still important in the sale of many commodities of common use, such as fresh fruits and vegetables, milk and other food products. The extent of house-to-house distribution in other lines of goods varies with business conditions. The numbers engaged in house-to-house selling tend to increase as general business conditions decline, and tend to fall when business conditions improve.

The even balance of the various marketing systems competing for consumers' trade is threatened by new competitive devices recently introduced by factors from the wholesaler-retailer system. It has been discovered that the numbers of small concerns engaged in wholesaling and particularly in retailing dependent upon wholesalers for their sources of supplies have, when organized and directed, a political potential useful in setting up political disadvantages for their competitors and in securing special privileges for themselves. Similar curbs on direct distribution have been introduced in several European countries usually in the form of prohibitions of further growth or expansion. In the United States such attacks commonly take the form of discriminatory regulation through taxation by State or municipal bodies. By the use of the discriminatory taxing power it has been discovered that it is possible to crush competition. Since the beginnings of such attempts made back in the middle 1920s, there have been more than 1,000 bills introduced of which, however, about 50 have been enacted. On January 1, 1939 there were 19 States and as many more municipalities having such taxes in effect. Some of these tax provisions are mild in effect, others are sufficiently heavy to be confiscatory.

Discriminatory taxes against direct distributions in the United States have taken several forms, such as licence taxes graduated in amount according to the number of stores operated, gross sales taxes, graduated in amount according to the volume of total sales, and store area taxes graduated in amount according to the floor space occupied by the store or stores owned. More recently several States and municipalities have applied the so-called Louisiana principle of the graduated tax against chains, basing the amount of the tax upon the number of units or stores owned, whether owned in the State or municipality affected or not. It is called the Louisiana method of chain store taxation for the reason that such a tax was first passed in that State under the Huey Long regime and has since been upheld by the courts.

In addition to the discriminatory tax schemes referred to above, representatives of the wholesaler-retailer system, with the co-operation of politicians, have (1940) secured the passage of price maintenance laws in 44 States and of still other laws regulating or prohibiting sales below costs, including expenses of distribution, in 23 States. These two types of legislation are respectively termed "fair trade laws" and "unfair practice acts." There has likewise been an effort to prohibit differentials in purchasing prices and other considerations ordinarily based on differences in quantities bought, in what is known as the Robinson-Patman Federal Act of 1936.

These measures whose purpose it is to restrict and hamper direct distribution are certain to have other effects besides those sought by their promoters. If they succeed in restricting and cutting down the competition, there will be less reason for the intense efforts now being made to render efficient service and keep prices down. This will eventually mean higher prices for consumers. Thus, this movement may in the long run awaken wide-spread consumer concern and antipathy. Whatever the legislatures may direct and the courts decide as to the permissibility of such competitive manoeuvres, it seems likely that the final decision will rest with the consuming public. The issues growing out of this method of restricting competition by political action are almost

certain before long to become major political questions. Consumers may have to decide by ballot as well as by patronage on what marketing institutions they may want preserved for their service. (See also MAIL-ORDER BUSINESS; PSYCHOLOGY, APPLIED: *Market Research and Advertising*; RETAIL SALES.)

BIBLIOGRAPHY.—C. F. Phillips, *Marketing* (New York, 1938); T. N. Beckman and H. C. Nolen, *The Chain Store Problem* (New York, 1938). (P. H. N.)

Marriage and Divorce. The constructive trends in the field of marriage so apparent in 1938 have not only continued but were accelerated in 1939. The history of divorce has been uneventful with no indication as yet that the increasing divorce rate has begun to recede. Public interest throughout 1939 turned toward efforts to conserve the family and marriage rather than to deal with the divorce problem. This indicates the growing conviction that the latter is a symptom of conditions that make for marital instability rather than a cause. (See also LAW (CASE): *Domestic Relations*.)

When the year is surveyed the most impressive indication of this greater nation-wide attention to the needs of marriage and the family is the number of well-attended meetings that were fact-finding, but forward-looking. Among the most important of these were: The Midwest Regional Meeting of the National Conference on Family Relations at Chicago, the Southern Regional Meeting of the National Conference on Family Relations at Baton Rouge, La., the Washington State Conference on Family Relations, at Seattle, Wash., the Fifth Annual Conference on the Conservation of Marriage and the Family, at Chapel Hill, N.C., the Conference on Education and Problems of Family Life at the University of Chicago, a session given over to Marriage and the Family at the meeting of the Eastern Sociological Society, at Asbury Park, N.J., the Sixth Biennial Conference of the National Council of Parent Education at Detroit, Mich., the White House Conference on the Child in a Democracy at Washington, D.C., the Oklahoma Family Life Institute of the University of Oklahoma, the Buffalo Social Hygiene Institute held prior to the National Conference of Social Work, the Marriage Conference organized by the Lafayette college students, and the very significant American Congress on Obstetrics and Gynecology at Cleveland, Ohio. This conference, the first attempt to draw together the medical and mental hygiene aspects of marriage, was enthusiastically supported by doctors, nurses, social workers and educators representing every section of the United States. Sponsored by the American Committee on Maternal Health, it was not only one of the most significant events of 1939 but also one of the most important contributions to the welfare of marriage during the last decade.

The increase of courses in colleges in preparation for marriage, noticeable in 1938, continued in 1939. Wherever these have been factual and sincere attempts to meet the needs of youth, they have met with a response from college students without parallel in the history of American education. One consequence of this marked interest has been the tendency to increase the attention given marriage in the more orthodox courses on the family. The University of North Carolina and Duke university co-operation in a program for the preparation of those planning to teach marriage and the family or to act as marriage counsellors began in the fall semester of 1939. This program is the first to specialize in graduate training of teachers and includes what appears to be the first course on problems of marriage ever offered by specialists of a medical school.

The development of courses in preparation for marriage among the colleges is beginning to influence educators in the secondary schools who realize that their youth for the most part will not continue their education beyond the high school. Various experi-

ments seeking to give high school students better preparation for marriage and parenthood are in operation and, during 1939, there was decided increase of interest in this sort of instruction. This led the American Association of School Administrators to choose as the subject of their 1941 Yearbook, prepared by its Commission, *Education for Family Life*. Various social agencies have also during the year extended or inaugurated specific courses dealing with marriage and family life as part of an adult educational program. The Henry Street Settlement course of lectures is representative of these new undertakings and the work of the Young Men's Christian Association and Young Women's Christian Association and especially the American Association of University Women illustrates the extension of former interests in marriage and the family. The radio has had an important part in the distribution of information attempting to conserve and improve marriage and the family. A special undertaking that deserves mention has been the half hour radio dramas attempting to interpret the contribution of women to the development of American life and thought.

Religious leadership showed a marked increase of interest in the conservation of marriage and the family during 1939. The Committee on Marriage and the Home of the Federal Council of the Churches of Christ in America, and the Family Life section of the National Catholic Welfare conference had an important part in directing this interest in the Protestant and in the Catholic Churches. Counselling by the clergy, especially through a conference prior to the wedding, is rapidly becoming a professional obligation. A changing attitude toward the problem of divorce on the part of the Protestant ministry is indicated by the increase of instruction in preparation for marriage offered in churches and especially by pressure on the divinity schools to include in their instruction more adequate preparation for marriage and family counselling.

Possibly the most revealing evidence of the movement in public thinking away from divorce as a problem to emphasis on efforts to conserve marriage and the family has been the articles that have appeared in popular magazines stressing the need of preparation for marriage. These are written in different mood than former discussions of the divorce evil and reflect the conviction of the editors that the public is taking a new and more realistic interest in marital problems.

During the year there also were numerous indications of a changing philosophy especially among those who as specialists are concerned with the problems of marriage and the family. Addresses reported in the press indicate that there is a lessening tendency to hold parents responsible for childhood mishaps that are believed to be causes of life maladjustments and to recognize the great part that social conditions have in these occurrences. There is also a decided shift of public opinion toward greater sympathy with the difficulties of young people due to prevailing social conditions. These changes in thinking are in part responsible for the very great increase of interest in educational and legislative programs for the advancement of the welfare of marriage and the home. In legislation the trends have been toward more regulation of marriage licences, more attention to the custody problem of children, and most of all toward pre-marriage health examinations. The progress of 1938 in the effort to curb venereal disease, especially syphilis, continued. Nine additional State legislatures passed premarital, and 14 enacted prenatal examination laws. Connecticut, the first State requiring a blood test for syphilis as a prerequisite for marriage, where the law has been in operation for over three-and-a-half years, reports a decrease of more than 50% in cases of congenital syphilis under one year of age, when the record for 1936 is compared with that of 1938. The attack on gonorrhoea also became more aggressive during the

year, in part due to the efficacy of treatment with sulphanilamide. The exhibit, Social Hygiene in Your Town, at the New York World's Fair, attracted 250,000 visitors. An appropriation of \$5,000,000 for financial assistance to the States and territories in venereal disease control work for the year beginning July 1, 1939, was authorized by Congress. There was an increase in the laboratory facilities maintained by States, by municipalities and by private hospitals for the testing for venereal diseases, in part due to the demand created by recent anti-venereal legislation. There has also been an improvement in the technique of the testing, lessening the expense and adding accuracy.

Greater popularizing of contraceptive birth control was a marked feature in 1939. In Connecticut, in contrast with the supreme court decision of Massachusetts, the prosecution of the Waterbury Maternal Health Center led to the opinion that even though there were no specific exceptions for the medical profession in the statute forbidding the distribution of birth control information, the intent of the law could not have been to interfere with lawful medical practice. There is a tendency for birth control centres to extend their function so as to include marriage counselling and fertility advice, and for leaders in the birth control movement, on account of the decreasing birth rate, to recognize the need of a broad maternal health program designed to encourage births as well as to give contraceptive advice. The State of North Carolina has gone farther than any other in furnishing contraceptive services as a part of the public health program, and now has 65 birth control centres. (E. R. G.)

Marshall, George Catlett (1880—), U.S. Army officer was born at Uniontown, Pa. on December 31. He studied at the Virginia Military institute from 1897 to 1901 and graduated from the Army Staff college in 1908. Commissioned second lieutenant of infantry on Feb. 2, 1901, he advanced through the grades to brigadier-general in 1936. In 1902 and 1903 he served in the Philippines, also from 1913 to 1916. He was an instructor at the Army Staff college after his graduation there, from 1908 to 1910, and was with the American Expeditionary Forces to France in 1917, on the general staff of the First Division, as chief of operations of the First Army and as chief of staff of the Eighth Army corps. He saw action at the battle of Cantigny and throughout the Aisne-Marne, St. Mihiel and Meuse-Argonne operations. After the war he was for five years aide-de-camp to Gen. John J. Pershing. From 1924 to 1927 he was stationed in China, and from 1927 to 1932 he was assistant commandant at the U.S. Infantry school. He was appointed commander of the 8th infantry in 1933 and commanding general of the Fifth brigade in 1936. On April 27, 1939 President Roosevelt appointed him Chief of Staff of the U.S. Army with the rank of full general, to succeed Gen. Malin Craig, and he assumed this office August 31. Gen. Marshall wears the Distinguished Service medal, the Victory medal with five bars, and the Croix de Guerre with palm.

Martin, Edward Sandford (1856–1939), American author and editor, was born January 2 at Willowbrook, Owasco, N.Y., and was educated at Harvard university, where he received his bachelor's degree in 1877. The year before his graduation he helped found the Harvard *Lampoon*. In 1883 he founded and became first editor of the old magazine *Life* and wrote consistently for that journal until 1933. He also contributed regularly to *Harper's Weekly* and was its assistant editor from 1893 to 1913. Among his published works are *Pirated Poems* (1890), *Cousin Anthony and I* (1895), *Lucid Intervals* (1900), *Unrest of Women* (1913), and *The Diary of a Nation* (1917). He died in New York city on June 13.

Martin, Helen Reimensnyder (1868–1939), American author, was born on October 18 at Lancaster, Pa., the daughter of a Lutheran minister. After a period of study at Swarthmore and Radcliffe colleges, she began to write short stories about the Mennonites of Pennsylvania. The "Pennsylvania Dutch" were the subject of most of her 30 novels, among which were *Tillie, A Mennonite Maid* (1904), *Barnabette* (1914; dramatized as *Erstwhile Susan* and played by Minnie Maddern Fiske), *The Marriage of Susan* (1921), *The Snob* (1924), *Challenged* (1925), *From Pillar to Post* (1933) and *Emmy Untamed* (1937). She died at New Canaan, Conn., on June 29.

Martinique, a French West Indian colony; language, French; capital, Fort-de-France; governor, M. Décharte. The area is 385 square miles. The population (246,712 in 1936) was officially estimated at 255,000 in 1938. The chief cities are: Fort-de-France, 48,395; Le Lamentin, 16,303. Martinique is administered by an appointed governor and an elected council, and is represented in the French parliament by a senator and two deputies. Fort-de-France is the French West Indian naval base and military headquarters. It has direct steamship connections with France, which were somewhat disturbed by conditions resulting from the European war, and with other parts of the West Indies, and air transport communication with New York. The colony has 600km. of automobile highways and 200km. of exclusively freight railway. Imports in 1938 amounted in value to \$7,449,000 and exports to \$8,127,000, compared with \$8,634,000 and \$9,312,000 respectively in 1937. Imports are principally foodstuffs, tobacco, lumber and textiles, of which France supplies approximately 70%. The chief exports are sugar, rum, bananas, pineapples, and cocoa beans, almost all of which goes to France. Approximately 45,000ac. of sugar cane is cultivated. Refining is done by 19 sugar mills, capitalized at 50,000,000 francs. There are two rum distilleries. The monetary unit is the French franc (value: 2.25¢ U.S.). The budget was balanced in 1937 at 101,100,000 francs.

Martinique has more than 100 primary schools, and several secondary and technical schools, with an enrolment in excess of 12,000.
(L. W. BE.)

Maryland, one of the original 13 States. Area 12,300 square miles. Population (1939) 1,795,646, in 1938, 1,777,905. Annapolis (population estimated, 1940, 13,848) is the capital; Baltimore (population 868,990) is the metropolis and one of the chief seaports of the country. The State birth-rate for 11 months of 1939 was 15.9, in 1938 (12 months) 17.1. The death-rate 1939 (11 months) 11.6, in 1938 (12 months) 11.6. Infant mortality 1939 (11 months) 49.9, in 1938 (12 months) 54.4.

History.—Among the important laws passed at the regular biennial session of the General Assembly two provided for the creation of separate conservation commissions; one to regulate oyster culture and the oyster industry; the other to supervise the propagation, protection, etc. of wild fowl, game, and "inland" fish. The State Welfare department was reorganized. And an end was made of the old county and district coroner system. In its stead was created a department of Post Mortem Examiners headed by an unpaid commission vested with authority to appoint medical examiners and to direct their work. A Legislative Council was created to collect information concerning the State Government, to supervise the interim work of committees and to prepare a legislative program in the form of recommendations at the next session of the General Assembly. Seven proposed constitutional amendments to be referred to the voters provide for an additional judge on one circuit, determining the residential qualifications of the

judges on another circuit; increased pay for members of the General Assembly, making the incumbent governor ineligible for a second consecutive term, appointing the clerk of the Court of Appeals instead of electing him, establishing people's courts in the counties. The last stipulates that the compensation of judges and other public officials shall not be exempt from the imposition of the State income tax. The new State office building in Annapolis designed to house all offices, most of them in Baltimore, was completed and is being occupied.

For the fiscal year ending Sept. 30, 1940 the budget totals \$49,967,245 including \$5,000,000 from the Federal Government and \$2,543,000 from State bond issues. These figures compare with \$41,556,339, \$2,683,309, and \$2,200,000 respectively for 1939.

Roads and Bridges.—The year 1939 saw the completion of the Ritchie Memorial highway, a dual road between Baltimore and Annapolis and most of the new road to Philadelphia, also dual. Work on the long bridges over the Potomac river at Morgantown and over the Susquehanna above Havre de Grace has progressed to the point where the opening of both on scheduled time (June 1940) is assured. The other bridges over the Potomac at Shepherdstown, Point of Rocks, and Hancock were completed. These replace structures which were washed away in recent floods; plans to replace the fourth, which suffered the same fate at Harper's Ferry, call for a new bridge at Sandy Hook farther down the stream. And a new bridge across Church creek connecting two parts of Cambridge on the Eastern Shore was opened. Automobile fatalities in 1939 totalled 415, in 1938 totalled 419.

Education.—The number of pupils in the public elementary and high schools is 299,478 and of these 63,402 are Negroes. The total for the preceding year was 293,686. Roman Catholic elementary and high schools have an enrolment of 48,249. Private schools in the State have 6,937 pupils. To provide higher educational facilities for Negroes and keep the races segregated the State acquired Morgan college, a Methodist school established in 1869, where courses comparable to those offered in State supported schools for whites will be offered.

Banking and Finance.—Trust companies and banks (115) had resources (June 30, 1939) of \$370,175,330 compared with \$328,443,709 (Sept. 28, 1938); deposits \$321,045,690 compared with \$277,692,861 in 1938. Mutual savings banks on June 30, 1939 had resources amounting to \$251,750,480 compared with \$250,373,897 the previous year. Deposits were \$224,525,107 in 1939 and \$223,285,015 in 1938.

Agriculture, Minerals, Manufactures.—Total acreage for all field and truck crops in 1939 was 1,652,200; in 1938 1,718,500. The "farm crop value" in 1939 was \$44,503,000, in 1938 \$43,676,000; the total cash income from sales amounted to \$65,700,000 in 1938 and \$75,520,000 in 1937 including about \$1,500,000 in Federal subsidies for each year. Oyster production Sept. 1, 1939 to Jan. 3, 1940 amounted to 2,136,940 bushels. This represents about half the length of the current season; same period a year ago 2,114,704 bushels. Hard crabs 1939, 250,594bbl., an increase of 50,601bbl.; soft crabs and peelers by number 12,924,376 in 1939, an increase of 1,713,556. In 1938, 1,306,000 tons of coal were mined, in 1937 1,570,000 tons. The value of other minerals in 1938 was lime and limestone \$1,055,072, miscellaneous stone including slate \$672,904, granite \$272,667, basalt \$101,292, asbestos, etc., \$262,232, sand and gravel \$1,831,548. The 1937 comparable figures are \$919,780, \$342,936, \$291,423, \$274,394, \$404,437, and \$2,236,132 respectively. The value of manufactures in 1937 was \$1,095,862,972 compared with \$757,852,170 in 1935. (ED. EL.)

Mason, Walt (1862–1939), American humourist and writer, was born on May 4 at Columbus, Ontario. His education was haphazard and he drifted into New York State in

1880 to become a farm labourer there. Soon he wandered westward and eventually settled at Atchison, Kan. where he was a reporter on the *Globe* for two years. After working sporadically on other papers he met William Allen White, who gave him a job on *The Emporia Gazette* and encouraged his fondness for writing poetry. His homespun "prose poems," first contributed to the *Gazette*, were later syndicated throughout the United States. Mason was also author of *Uncle Walt* (1910), *Rippling Rhymes* (1913), *Horse Sense* (1915), *Terse Verse* (1917) and other volumes. He died at La Jolla, Calif., on June 22.

Masonic Order. Two features of this institution which have attracted the attention of educated men are illustrated by events of 1939. (1) *Antiquity*.—*Ars Quatuor Coronatorum* (XLIX, 4), organ of the celebrated Quatuor Coronati Lodge (of Research) No. 2076, London, published a paper read before that body by H. C. De La Fontaine on "The Portuguese Order of Christ" which is there shown as a survival of the ancient Knights Templar, organized at Jerusalem in 1118, flourished for nearly two centuries but was finally suppressed in France, where its Grand Master, Jacques de Molay, was burned in 1314. Four years later it was revived in Portugal by King Diniz, with the Pope's permission, and continued under a Grand Master, chosen by him, and a new name. Undergoing various changes, but preserving its identity, through the centuries, it became in 1789 a secular order, affording a model for branches which arose in both France and Britain. From the latter, the Templar degree was transplanted to America and was conferred in a Boston Masonic lodge during the 18th century. The Grand Priory of England and Wales, and the Grand Encampment of Knights Templar of the United States (organized 1816) are memorials of this long chapter of Masonic history.

(2) *Universality*.—"Masonry is known and practiced in every country and clime and by every race of civilized men," declared René Raymond, Grand Commander of the French Supreme Council, before the Algiers lodges on March 12. And this is still true despite its persistent suppression in most of the "totalitarian" countries. Its greatest growth has been in the United States where the latest available figures disclose 15,630 lodges with 2,521,651 members. Canada has 1,380 lodges with nearly 173,000 members; Australia, 162,031; New Zealand, 25,788. But it was in England, the *nidus* of modern Masonry, that its universality was best exemplified in 1939. Its "United Grand Lodge" (founded in 1717) is not only the premier one of the world; it is also the most widespread in its constituencies. Nearly 5,000 lodges, averaging about 80 members each, are scattered over the globe, owing direct allegiance to this mother grand body. Moreover, the present reigning House, ever since its accession in 1714, has been a patron of Masonry and, except for an interval of 30 years, has furnished an occupant of the Grand Master's throne for more than a century and a half. During the last 38 years, the incumbent has been the Duke of Connaught, brother of the late Edward VII, while the Pro-Grand Master, upon whom the active duties of the office devolve, is the Earl of Harewood, husband of Princess Mary, George VI's only sister. The King, who before his coronation, was Grand Master of Scotch Masons, acted as installing officer of his brother, Duke of Kent (at an "Especial Meeting" of this premier Grand Lodge) as Grand Master of English Masons throughout the world. The "Meeting," held in the new Freemasons Hall and the Olympia Stadium in London, lasted from July 18 to 21, 1939, and the ceremonies were on a scale befitting the participation of royalty. Representatives were present from the other British, and from 18 American Grand Lodges, besides distinguished individual Masons from many countries, and the whole affair, following so closely upon the King's North American tour, took on a highly

international aspect.

Another event which was awaited by Scottish Rite Masons as exemplifying the universality of the order, was the 8th International Conference of Supreme Councils, scheduled to meet at Boston on September 23 with the Northern (U.S.) Supreme Council as the host. Unfortunately no Supreme Councils outside the western hemisphere were represented but four therein (Canada, Cuba, Panama and Peru) sent a member representative. Only three sessions were held before adjournment, on September 29 and none of the matters presented to the conference was acted upon.

(C. S. L.)

Massachusetts, one of the thirteen original States of the United States, popularly known as the "Bay State"; area, 8,266 sq.mi.; population according to U.S. census of 1935, 4,350,910, estimated by U.S. Census Bureau, July 1, 1937, 4,426,000, estimated Jan. 1, 1938, 4,435,000; capital, Boston, population according to U.S. census of 1935, 817,713, estimated Jan. 1, 1938, 810,000. Of the State's population (1930) 1,913,418 or 45% live in the cities; 4,192,926 whites, 52,365 coloured; native born, 3,194,978; foreign born, 1,054,636.

History.—The Republicans, led by Governor Leverett Saltonstall, completed in 1939 their first year in control of the executive department of the State after six years of Democratic rule. Inaugurated in Jan. 1939, for a two-year term, were the following elective officers of the Commonwealth: governor, Leverett Saltonstall (R.); lieutenant-governor, Horace T. Cahill (R.); secretary, Frederic W. Cook (R.); treasurer, William E. Hurley (R.); attorney-general, Paul D. Dever (D.); auditor, Russell A. Wood (R.). The legislature, also elected for two years (though it now meets biennially and will not convene in 1940), consists of a Senate of 40 members, 28 Republicans and 12 Democrats, and a House of 240 members, 143 Republicans and 97 Democrats. By the end of the session, death and resignation had reduced this number to 142 Republicans and 96 Democrats.

The 1939 legislative session, the 151st in the history of the State, convened on Jan. 4, 1939, and was prorogued on Aug. 12. It sat for seven months and eight days—the third longest session in the State's history. During the session 517 acts and 74 resolves which had passed the General Court (as the legislature is termed in Massachusetts) received also the approval of the governor. Twenty-two acts and one resolve were returned by the governor without his approval, and in each case his veto was sustained. One act was allowed to become law without his signature. The principal battle of the session was over the taxation program proposed by the governor, a large portion of which finally passed. Near the end of the session the battle became so intense that the General Court set a new record by sitting continuously for more than 35 hours before prorogation. The governor also succeeded in reorganizing several State departments through removals, forced resignations and legislation.

As an aftermath of the severe hurricane of Sept. 1938, investigation into expenditures approved by several State departments resulted in the removal of James G. Reardon, commissioner of education, and William F. Callahan, public works commissioner, and in severe official criticism of State Conservation Commissioner Ernest J. Dean. In each case it was charged that expenditures were approved which were not covered by the State's special appropriation act and in some instances were not even of emergency nature. In other respects the State had fairly well recovered by Jan. 1, 1940 from the damage inflicted by the hurricane.

Education.—According to the latest available statistics from the department of education (June 1939) the public day schools of Massachusetts have an enrolment of 717,365, with an average daily attendance of 640,121. This represents a slight decrease

from the previous year. In addition, there were 30,750 pupils in the public evening schools and 909 in the public vacation schools. The total amount of money expended for the support of the public schools was \$70,198,883.23, of which \$50,506,174.78 was devoted to salaries and \$776,503.13 to textbooks.

Under the law education is free. It is compulsory for all between the ages of 7 and 14 years and required up to 16 years unless the sixth-grade work is completed. Massachusetts maintains a State college at Amherst, a State nautical school, a school of art in Boston, three textile schools and teachers' colleges at Bridgewater, Fitchburg, Framingham, Hyannis, Lowell, North Adams, Salem, Westfield and Worcester. In addition it supports a division of university extension, and a division of vocational education. It also awards State scholarships to deserving students who are children of World War veterans in several private colleges and universities. In the year ending Nov. 30, 1938, the State teachers' colleges had an enrolment of 2,470 women and 563 men. The number of people registered for university extension courses was 37,500.

Massachusetts also contains many important private institutions of higher education, among them Harvard, the oldest university in North America, Amherst, Williams, Massachusetts Institute of Technology, Clark, Boston college, Holy Cross, Boston university, Tufts, and Northeastern. Institutions for women include Mount Holyoke, Radcliffe, Simmons, Smith, Wellesley, and Wheaton colleges.

Charities and Correction.—Supervision of the State institutions is divided among several departments. The commission of Correction has charge of the State prison at Charlestown, the Massachusetts reformatory at Concord, the Reformatory for Women at Framingham, the State farm at Bridgewater and the Norfolk prison colony at Norfolk.

Under the jurisdiction of the department of Mental Health are State hospitals at Boston, Worcester, Taunton, Northampton, Danvers, Westborough, Medfield, Monson, Gardner, Waltham, Wrentham, Foxborough, Grafton, and Norfolk, as well as the Boston Psychiatric hospital, the Belchertown State school, and the Hospital Cottages for Children at Baldwinville. The department of Public Health supervises sanatoriums at Rutland, North Reading, Lakeville, and Westfield and the Hospital for Cancer Patients at Pondville.

Banking and Finance.—The State commissioner of Banks had under his supervision as of Oct. 31, 1939, a total of 881 banking institutions, including 192 savings banks, 72 trust companies, 184 co-operative banks, and 402 credit unions, and a few private banks. On that date these institutions had assets aggregating \$4,690,005,000. According to the commission of Administration and Finance, the State's net direct debt at the end of 1939 stood at \$31,366,090.13. This represents a decrease of \$9,318,994.23 during the year. The leading sources of revenue were motor vehicle licences and gasoline taxes, \$27,672,155.71; Federal grants, \$23,310,000.74; corporation and miscellaneous taxes, \$11,299,165.76; assessments on cities and towns, \$18,000,000. Total receipts for the year (including refunds of \$22,882 and transfers of \$245,000) \$113,356,468.45. Total expenditures, \$131,571,492.03. The General Court imposed new taxes of \$23,000,000 on cigarettes, liquor, dog-racing, inheritances and income surtaxes. The new taxes failed to balance the budget and left about \$18,000,000 in 1939, \$16,000,000 in 1940, to be levied from cities and towns in order to make up the deficit. These assessments are in part offset by a grant of \$9,600,000 each year to municipalities for highway improvement.

Agriculture, Manufactures, Mineral Production.—During 1939, according to the statistics of the United States Department of Agriculture, the State raised: 9,920,000lb. of tobacco, 465,000

bu. of cranberries, 280,000bu. of grain corn, 262,000 tons of silage corn, 2,420,000bu. of apples, 512,000 tons of hay and 231,000bu. of oats. Total crop acreage for 1939 is estimated at 490,650ac., an increase of 5,600ac. from 1938. The production of milk in 1938 totalled 801,000,000lb. and on its farms were 137,000 milk cows, 103,000 hogs, and 8,000 sheep, which gave 44,000lb. of wool in 1939.

With respect to manufactured goods, statistics for 1938 show the value of the State's leading products as follows: boots and shoes, rubber, \$16,658,838; boots and shoes, other than rubber, \$132,964,607; paper boxes, \$24,735,850; bread, \$79,255,214; women's clothing, \$43,987,205; cotton goods, \$66,988,947; dyeing and finishing textiles, \$47,900,883; electrical supplies, \$92,260,000; foundry and machine-shop products, \$63,703,683; leather, \$48,668,597; paper, \$55,447,418; printing, \$83,046,915; rubber goods, \$48,351,026; total, \$2,054,865,331. The number of industrial establishments in the State at the end of 1938 was 8,570, and the average number of wage-earners employed, 425,157.

Fishing is still one of the State's leading industries. In 1936 about 330,000,000lb. of fish, valued at \$9,000,000 entered the ports of Boston and Gloucester and were distributed therefrom.

The chief mineral products and their 1936 values were: coke, \$6,048,544; clay, \$953,655; lime, \$1,193,429; sand and gravel, \$831,103; and stone, \$3,204,858.

(A. M. S.)

Massachusetts Institute of Technology.

Notable among the institute's educational activities during 1939 were the increase in services to governmental agencies and other public bodies, and the growth of co-operative research between departments within the institute and between the institute and outside agencies. These activities have been directed toward improved health or safety, toward new or improved products and processes for industry, toward assistance of both business and Government in problems of personnel or planning, and toward national defence.

Altogether over 500 research projects were under way in institute laboratories. The institute's operating budget for the year 1938-39 totalled \$3,208,400; the gifts received totalled \$1,362,300; its educational plant assets passed the \$16,000,000 mark; and the book value of its endowment funds increased \$660,000 to \$36,230,000.

Enrolment for the academic year 1939-40 totals 3,100 of which 721 are graduate students, the largest number in the history of the institute. The extent to which the institute has become a national and international institution is indicated by the geographical distribution of institute students in 1939. Seventy per cent came from outside Massachusetts, 60% from outside New England, 33% from outside the North Atlantic States, and 7% from outside the United States. The number of foreign students registered, 231, represented 43 foreign countries. Of the graduate students registered in 1939, less than 25% received their Bachelor's degree from the institute, and altogether 220 colleges were represented.

Changes in personnel included the appointment of Walter R. MacCormack as dean of architecture replacing William Emerson, retired; Robert G. Caldwell, until recently U.S. Minister to Bolivia, as dean of humanities; Antoine M. Gaudin as Richards Professor of mineral dressing; and Sverre Pettersen as associate professor of meteorology.

New members elected to the Corporation during 1939 included two life members, Vannevar Bush and William Emerson; three alumni term members, Charles Edison, Philip W. Moore, Harold B. Richmond; and one special term member, Charles R. Hook.

(K. T. C.)

Mathematics. The founding, under the auspices of the American Mathematical Society, of a new international journal, *Mathematical Reviews*, to abstract and review current mathematical literature was an outstanding event in mathematics during 1939. The new monthly is sponsored by the American Mathematical Society, the Mathematical Association of America, and other organizations; grants from the Carnegie Corporation and the Rockefeller Foundation assure its publication for at least five years. *Mathematical Reviews*, the first number of which appeared late in December, is noteworthy for two important innovations: a low subscription price, which will ensure a wide circulation; a microfilm and photoprint service which will enable any subscriber, for a nominal charge, to obtain a microfilm or photoprint copy of any article reviewed.

The war in Europe dealt heavy blows to mathematics. There was the inevitable diversion of energies normally devoted to research in mathematics, but the subject and its scholars suffered also the actual horrors of war. The partition of Poland, whose mathematics had achieved a position of the highest eminence, resulted in the destruction of scholars, universities, and publications. The extent of the loss is not yet known. In the United States elaborate plans and arrangements had been completed for an International Congress of Mathematicians to be held in Cambridge, Mass. in Sept. 1940; the outbreak of war caused its indefinite postponement.

Although investigations in mathematics continue in all parts of the world, the year 1939 brought additional evidence of the importance of America in this field. About 500 research papers were presented at meetings of the American Mathematical Society. The expanding publication program, however, was especially significant. *Mathematical Reviews* has been mentioned already; the first two volumes of the new *Princeton Mathematical Series* were published in 1939. In addition, the University of Toronto announced the first two volumes of a new series to be known as *Mathematical Expositions*.

New results were obtained in every branch of mathematics in 1939. Investigations in algebra, which have been pursued with great vigour in Germany and America, were continued. Numerous papers on the theory of lattices and on applications of that theory to the theory of groups were published. *The Classical Groups*, by Weyl, and *Topological Groups*, by Pontrjagin (translated from the Russian by Emma Lehmer), were published as the first two volumes of the new *Princeton Mathematical Series*. *Structure of Algebras*, by Albert, and *Orthogonal Polynomials* (in the field of analysis), by Szegő, appeared in the *American Mathematical Society Colloquium Publications* series.

A revival of interest in algebraic geometry has occurred in the last 15 years as a result of the introduction of new methods—methods which are purely algebraic in character. A paper by Zariski entitled *The Reduction of the Singularities of an Algebraic Surface* is of prime importance. Other important papers were contributed by MacLane, Muhly, and Schilling; important books, by Conforto and van der Waerden.

Topology, the newest branch of geometry, maintained in 1939 its position as one of the leading fields of research in mathematics. A new book by Newman, *Elements of the Topology of Plane Sets of Points*, is a valuable addition to the literature.

In the field of analysis, investigations devoted to the Problem of Plateau and the related problem of conformal mapping occupied an important position. Significant contributions were contained in papers published by Douglas, Courant, and Morse and Tompkins. The papers of the latter two authors employ methods developed by Morse in *Functional Topology and Abstract Variational Theory*.

Research in probability and statistics continues unabated; their

applications are of the greatest importance in the other sciences—physical, biological, and social. A recent book, *Mathematical Biophysics*, by Rashevsky, is significant in beginning the application of mathematical methods to biology. This attack on its problems holds great promise not only for biology but also for mathematics. There is no doubt that the history of mathematical physics will repeat itself: from biology there will flow ideas destined to enrich the science of pure mathematics.

Matter, Structure of. During 1939 there were several notable contributions to our knowledge of the constitution of matter. Most of these have been in the field of atomic physics and have dealt particularly with the structure of the nuclei of atoms.

First, as regards the fundamental physical entities, the evidence for the existence of the mesotron has increased during 1939. This particle, which is now thought to constitute the very penetrating part of the cosmic rays, has a mass intermediate between that of the electron and proton, and appears with both positive and negative charge. Most likely it is formed at very high altitudes in the atmosphere from incoming gamma rays, and is probably unstable with a lifetime of a few millionths of a second. Direct experiments with a second fundamental entity, the neutron, have shown that it behaves as a small magnet; its magnetic moment was measured for the first time.

During 1939 several new radioactive forms of the elements (isotopes) were found, but experiments in this field were directed primarily to the study of the properties of the many unstable isotopes (roughly 300) already known. Their lifetimes and the energy of the particles emitted during their transformations have been measured. A possible sequence of transformations of these unstable isotopes was found in which four protons are absorbed and finally a helium atom formed. This formed the basis for the first adequate explanation of the heat of the sun and other stars. The phenomenon of nuclear "isomerism" was found to be much more general than was previously suspected. Probably as many as 30 pairs of unstable nuclei are known that are identical in nuclear charge and mass and yet disintegrate in different manners. One unstable isotope was discovered during 1939 that deserves special notice—a heavy hydrogen nucleus with three times the mass of proton. This hydrogen is radioactive with a half life of approximately 230 days. Heavy hydrogen (deuterium) with twice the weight of ordinary hydrogen was discovered in 1932 and the new unstable isotope is formed in a gas discharge under the violent impact of two deuterium nuclei.

A stable isotope of helium with an atomic weight of three was also discovered; it occurs mixed with ordinary atmospheric helium of mass four in the ratio of about one part to 10,000,000. A promising method for partially separating isotopes was developed during 1939 based on the phenomenon of thermal diffusion. (See also ISOTOPES, SEPARATION OF.)

The most important discovery during 1939 was that of the "fission" or splitting up of the heavy elements—uranium, protactinium, and thorium—into two elements in the middle of the table. This division occurs as a result of the absorption of neutrons. In 1934 the absorption of neutrons by uranium had been observed to give rise to a group of radioactive elements. These were supposed at that time to be new "transuranium" elements, with masses and atomic numbers greater than those of the known elements, and further experiments identified as many as 12 such elements with different rates of disintegration.

It was a great surprise when in Jan. 1939, O. Hahn announced that one of these supposedly transuranium elements was really

NEW TYPE OF ATOM-SMASHER with 8ft. glass tube, perfected in Jan. 1939 at Cornell university by Prof. Lloyd P. Smith

barium, and suggested that a new type of radioactivity might exist wherein the unstable nucleus, formed by the addition of a neutron to a uranium nucleus, instead of ejecting one of its nuclear constituents, may divide into two particles of comparable mass. This "fission" of a heavy nucleus should theoretically have several consequences. First the two particles should fly apart with great energy. This was soon verified, the particles were found to recoil from a uranium surface, to give intense pulses of ionization, and to produce heavy drop tracks, the energy set free agreeing with that calculated from the change of mass according to Einstein's relation.

A second consequence was that the new elements formed in the middle of the periodic table should be far too heavy for stability. They must either eject neutrons or change into elements with a greater nuclear charge. Experiments showed that both processes take place. Thus as a result of the fission process we find two mixtures of radioactive elements, a light group in which various observers have identified radioactive forms of krypton, rubidium, strontium, yttrium, and molybdenum, and a heavy group including radioactive isotopes of antimony, tellurium, iodine, xenon, caesium,

and barium. Several of these have already been shown to be elements formerly considered trans-uranium elements. How many of the trans-uranium elements really are known elements is still uncertain, but at least one of the atomic charge 93 and mass 239 seems likely to remain. As far as experiments have gone, the same fission products are obtained from thorium and protactinium as from uranium.

The fact that in the process of fission neutrons are produced, which in their turn might cause fresh fission processes in other atoms has suggested that a self-sustaining disintegration of uranium might occur.

Such a process would have a tremendous technical significance, as the energy set free in the fission of the uranium atoms in one pound of uranium oxide amounts to the extraordinary total of approximately 8,000,000 kwh. hours. However, the few experiments that have been made in this connection have not given any support to the idea that a self sustaining fission process is possible. (See also PHYSICS.)

BIBLIOGRAPHY.—A summary of nuclear fission is given by N. Feather, *Nature* (May 27, 1939); a discussion of isomerism is given by B. Pontecorvo, *Nature* (July 29, 1939); Bethe's paper on the energy production in stars appeared in *Physical Review*, 55 (1939); see also *Nature*, 143 (1939). (A. J. D.)

Max, Adolphe (1869–1939), burgomaster of Brussels, achieved a world-wide fame in 1914–18 for his defiance of the German army of occupation in Belgium. He was born on December 31 and studied at Brussels university, where he was awarded his law degree at the early age of 20. For nine years he was provincial councillor for Brabant and in 1903 was elected a city councillor of Brussels. Later he became managing editor of *Le Soir* in the Belgian capital, and he was elected burgomaster of Brussels in 1909, retaining this office until his death. For his utter lack of respect for the German army chiefs he was imprisoned in 1914 and not released until Nov. 1918, despite appeals on his behalf from prominent personages of many nations. He died at Brussels on November 6 and was buried with national honours.

Mayo, Charles Horace (1865–1939), American surgeon, was born in Rochester, Minn., on July 19, the second son of Dr. William Worrall Mayo (1819–1911). He was educated at Rochester High school and a private academy, then went to Chicago, where he studied surgery under Dr. Christian Fenger, Dr. Nathan Smith Davis, and other famous surgeons of the day. He received his medical degree from Northwestern university in 1888 and later took post-graduate work in New York city. While he was still a student, a cyclone struck Rochester and killed 22 persons. His father was placed in charge of the 300 injured and was ably assisted in his work by Charles and his elder brother William (*q.v.*), though Charles had no formal medical training at that time. After this disaster the town recognized the need for a hospital, which was duly built and dedicated six years later. St. Mary's hospital was the nucleus of the famous Mayo clinic, established in Oct. 1889 by the father and his two sons, but not formally organized by the brothers until 1912. By this time the clinic was admitting thousands of patients annually and was already known as one of the world's greatest medical centres, a model of treatment not only for general diseases and operations, but for maladies that defied diagnosis. In 1938, the year before Dr. Charles Mayo's death, the clinic admitted its 1,000,000th patient.

Dr. Charles Mayo's versatility extended to practically all fields of medical knowledge, and his associates declared that he had performed every conceivable type of operation before his retirement in 1929. He is best known, however, as the originator of modern goitre surgery, concerning which he first published a paper in 1904. Almost equally famous was his surgical treatment of the nervous system. He originated a technique for operating upon varicose veins, performed more than 700 operations for cataract of the eye, and contributed much to surgery of the brain, ear, nose, throat, and abdomen. Focal infection and preventive medicine also occupied his attention.

In 1913 he was appointed first lieutenant in the Medical Reserve Corps of the U.S. Army and was later advanced to colonel. Alternating every six months with his brother, he was chief consultant for all surgical services in the Office of the Surgeon General from 1917 to 1919. He was appointed brigadier general in the Medical department of the U.S. Army in 1926. He was president of the American College of Surgeons in 1924-25 and of the American Medical Association in 1916-17. He wore the Distinguished Service medal and was an officer of the Legion of Honour. His recognitions from other countries almost outnumbered those bestowed upon him by his own. He died in Chicago on May 26 after an attack of lobar pneumonia and was buried in Rochester. See also *Encyclopædia Britannica*, vol. 15, p. 124.

Mayo, William James (1861-1939), U.S. surgeon, was born at Le Sueur, Minn. on June 29, and was educated at Rochester (Minn.) high school, Niles academy, and the University of Michigan, where he received his medical degree in 1883. For an account of the association with his father and younger brother in the famous Mayo clinic, see MAYO, CHARLES HORACE above; see also *Encyclopædia Britannica*, vol. 15, pp. 124-5. After his graduation from the University of Michigan's medical school, Dr. Mayo returned to Rochester to begin the practice of surgery and remained there except for brief periods until his death. He and his brother were known the world over for their eminent accomplishments in surgery; while Dr. Charles Mayo performed many varieties of operations Dr. William Mayo was perhaps best known for his surgery of the stomach. During the World War (1914-18) the two brothers alternated as chief consultants in the office of the U.S. Surgeon General. Dr. William Mayo was president of the American Medical Association (1905-06), the American Surgical Association (1913-14), the American College of Surgeons (1918-20), and the Congress of American Physicians and Surgeons (1925); his honorary degrees, decorations, and honours almost equalled in number those of his brother. He died at Rochester on July 28, two months after the death of Dr. Charles H. Mayo in Chicago.

Meat. About 500,000,000 lb., or 5%, more meat was consumed in the U.S. in 1939 than in 1938, the Institute of American Meat Packers estimated. This is about 8% higher than the five-year (1929-33) average annual consumption. In the meat-packing year, which ends October 31, Federal-inspected meat totalled 11,390,000,000 lb. in 1939 and 10,821,000,000 lb. in 1938. Consumption for the year ending Oct. 31, 1940, is forecast at 12,200,000,000 pounds. Meat inspected by the Federal Government represents roughly about two-thirds of consumption. Increased meat production in 1939 was caused by the fact that the numbers of livestock on United States farms are rapidly filling up the reductions made by the droughts of 1934 and 1936 and the Government control program. The United States is the largest meat-producing country and meat animals provide about 25% of the farm income.

Prices of meat, especially pork products, rose sharply in the

U.S. during the first ten days of September, following the outbreak of war in Europe. By mid-November prices had gradually worked back to near their pre-war levels. The most marked effect of the war on the meat situation in the United States was the abrupt cessation of imports of canned hams from Central Europe, principally from Poland. A new item in meat imports was reported in 1939, dog food, of which 3,649,604 lb. valued at \$109,145 was imported, chiefly from Argentina, in the nine months ending September 30. War had no effect on beef exports, but increased United States fresh pork and lard exports sharply.

U. S. Imports and Exports of Beef and Pork Products
(For first ten months of 1938 and 1939)

	Imports			Exports	
	1939 lb.	1938 lb.		1939 lb.	1938 lb.
Beef, fresh . . .	1,830,524	1,216,152	Beef & Veal, fresh	4,137,484	3,261,065
Veal, fresh . . .	125,595	78,193	Beef, cured . . .	5,477,979	4,968,391
Beef & Veal, . . .			Beef, canned . . .	1,200,606	1,523,002
pickled & cured	1,686,004	1,332,568	Pork, fresh & . . .		
Beef, canned . . .	69,647,546	58,400,564	frozen	20,307,771	5,559,805
Pork, fresh . . .	1,622,343	3,443,364	Pork, Cumber- . . .		
Hams, Shoulders			lands & Wilt- . . .		
& Bacon . . .	34,609,541	34,308,891	shires	2,924,682	614,220
Pork, salt, cured			Hams & Shoulders	49,662,914	40,411,509
& pickled . . .	2,075,039	3,058,584	Bacon . . .	7,511,581	6,440,342
			Pork, pickled . . .	10,665,784	9,782,349
			Pork, canned . . .	7,167,915	6,438,516
			Lard	213,557,320	148,324,925

Meat animals processed under Federal inspection the first ten months of 1939 were: cattle, 7,835,584 head; hogs, 31,694,605 head; sheep, 14,383,531 head. Cattle and calves imported into the United States the first nine months of 1939 numbered 604,015 head, as compared to 295,753 in the same period in 1938.

(S. O. R.)

Medical Association, American: see AMERICAN MEDICAL ASSOCIATION.

Medical Association, British: see BRITISH MEDICAL ASSOCIATION.

Medicine. Medical discoveries in 1939 centred principally on new developments in the fields of the vitamins, the glands and sulphanilamide with its derivatives. The year saw the lowest sickness and death rates ever achieved in the United States, including a tremendous lowering in maternal mortality.

Vitamins.—Most significant of the vitamin studies were those related to the use of vitamin B₁ in relationship to various forms of neuritis, some of these being classified as alcoholic neuritis, diabetic neuritis and metabolic neuritis, also in tics or habit spasms and some nervous disorders. The scientific name for this vitamin is thiamin chloride. It also influences appetite and digestion favourably. An adult requires about 300 to 350 international units, which is equivalent to about one milligram of pure thiamin per day. Pre-school children apparently require as much as 20 to 25 or more international units of this vitamin for every 100 calories of food that they eat. Whereas it was formerly thought that the foods which we eat contained plenty of vitamin B₁, we now know that our refined diet, and particularly the use of refined cereals, has produced a rather general shortage.

Vitamin B₁ is a water-soluble vitamin. Hence, when beans and peas are cooked in water, much of this vitamin is dissolved in the water. When the water is discarded, the vitamin B₁ is lost. There are only about ten foods which contain more than three micrograms of thiamin for each gram of food. These are principally potatoes, pork and liver, eggs, milk, fruits, beans and whole grain cereals.

A significant step has been the recognition of the possibility of reinforcement of white flour and other refined foods by the addition of thiamin. The vitamin also has significance in certain diseases of animals and of plants.

Other interest in the vitamins centred on vitamin K, which is useful particularly in forms of haemorrhage when there is a deficiency in the prothrombin of the blood. A new test for determining whether or not people need vitamin K has been developed during 1939. Babies born jaundiced or suffering from haemorrhage at birth sometimes have a deficiency of this vitamin. In such cases, preparations of vitamin K, derived from alfalfa, kale, spinach, carrot tops, tomatoes and oat sprouts, or made synthetically, can be given by mouth or injected directly into the body. This should be followed by an increased amount of prothrombin within three or four hours.

Interest in vitamins has also centred on vitamin B₆, which seems to be related to certain skin disorders. Moreover, much has been done with the vitamin concerned in pellagra known as B₂ or riboflavin.

Glands.—Most of the work on the glands during 1939 has been concentrated on the male and female sex hormones, which are now available in various forms, and which may be injected into the body, rubbed into the skin, or planted in pellets, for slow absorption, under the skin.

The male sex hormone, testosterone propionate, has now been shown to be of value particularly in persons who have lost the effects of these glands because of surgical operation, accident or disease. The use of this product has been especially important in men of the female type, in whom it will increase masculinity, produce a growth of beard and a deepening of the voice. Apparently, it is also effective in men who pass through a period resembling the climacteric in women, during which time there is a lessened secretion of the important male sex hormone. Apparently, also, the glandular material may be used in stimulating sex activity, although it is now established that the use of this material tends to inhibit the formation of the sperm or egg cell.

The female sex hormone known as estrogen has been found useful in many of the disorders associated with the climacteric in women, including not only the hot flashes and nervous reaction, but also the mental depression. Apparently also this material has been effective in some cases of leukoplakia, which is a thickening of the tongue, producing a condition which looks like a relief map, sometimes called geographic tongue.

Special studies made on the sex hormones indicate the possibility that they may have tissue-stimulating qualities, and that in persons in whom there is the history of cancer heredity, the glandular material must be used with the greatest of caution. Excess doses may be followed by enlargement of the breasts, and instances are reported of the possible development of cancer following large doses where there is susceptibility.

A synthetic substitute for oestrogen was announced as stilbestrol. This synthetic substance has all of the effects inherent in the glandular material itself.

Sulphanilamide and Sulphapyridine.—Extensive investigation made with sulphanilamide and sulphapyridine in a wide variety of diseases indicated that these drugs constitute one of the greatest medical discoveries of all time. Sulphanilamide has been shown to be of special value particularly in streptococcal infections and in certain forms of influenzal and streptococcal meningitis, which were formerly invariably fatal but now yield to the use of this remedy. It has been found especially valuable in trachoma, which is believed to be caused by a filtrable virus. Its use has been of the utmost importance in operations on the ears and the mastoid.

Sulphapyridine has been established as of special value in various forms of pneumonia, in some instances making the more expensive anti-pneumococcus serums unnecessary. Investigators in Boston and in Chicago found that there might be possible control for a formerly fatal condition, known as subacute bacterial endo-

carditis, in which they inject heparin, a new product developed in Canada, shown to have virtue in preventing coagulation of the blood and the formation of fibrin. After this material has been given to loosen up the vegetation on the heart valves, sulphapyridine was given to control the growth of the germs. Its effects were measurable as revealed by the response in lowering of the fever in the patients.

Studies with these remedies were of value also in smallpox, and in lymphogranuloma venereum. The tests in infantile paralysis and in tuberculosis were quite disappointing.

A new modification, sulphamethylthiazol, is believed to be especially useful for staphylococcal infections although this is not yet well established.

Metrazol Shock Therapy.—Continued work with shock therapy in dementia praecox indicated somewhat less promise in the insulin shock method, although considerable virtue still inheres in this form of treatment. Metrazol shock began to be used more extensively and was found to be of value also in certain depressional conditions affecting the mind, like manic-depressive insanity and involutional melancholia.

Surgery.—In the field of surgery, a new operative procedure which attracted attention was a technique developed by Lempert for persons with otosclerosis, in which a window is made directly into the internal ear, after which hearing is promptly restored. Unfortunately after a time, in many cases, there is a development of new tissue which invalidates the value of the operation. At present, investigators are working on modifications of the technique which will prevent this secondary complication.

Another interesting surgical procedure involves an operation for ductus arteriosus, a condition occurring at birth, in which an opening from the large veins into the aorta, so that the blood does not pass through the heart, is closed surgically. Lives have been saved by this new operative procedure.

A technique developed by Brien King involves a plastic operation to overcome paralysis of the vocal cords, caused by cutting or injury of the nerve in the operation on the thyroid gland. Successful results in a number of cases attracted interest throughout the world.

Continued studies made possible further transplantation to overcome scar tissue on the cornea of the eye with tissue removed from the eyes of babies who died at birth.

Another operation involved a technique employed on the sympathetic nervous system to control the pain in angina pectoris—a difficult surgical procedure employed only in the most serious cases.

Bacteriology.—Investigations in the field of bacteriology brought new knowledge concerning the virus which is responsible for the form of inflammation of the brain known as equine encephalomyelitis.

It was shown that the virus of infantile paralysis may be found in stools, and may in some instances enter the body by way of the gastro-intestinal tract.

An organism was isolated and studies were made in relationship to it as concerns the artificial infection of mice with a virus that will cause rheumatism.

Studies were also made on influenza as it occurs in swine, which indicate that swine influenza may be definitely related to human influenza, and that perhaps swine constitute the means by which epidemic influenza is kept alive between periods of epidemics.

A vitamin was discovered in the bacteria found in soil which seems to have the power of destroying gram-positive germs which bring about infections in human beings.

Studies made in the South indicate that rabies, formerly under control, is gradually increasing in certain portions of the South, affecting cattle particularly, as well as man.

Nervous System.—Most significant in studies on the nervous system were with metrazol shock method, already mentioned, and also the application of electroencephalography in determining new facts about the character of epilepsy.

Drug Therapy.—In the field of drug therapy, continued work showed the importance of prostigmine in the weakening disease of the muscles known as myasthenia gravis.

A form of epinephrine was developed known as slow epinephrine which may be put into the body and absorbed over a long period of time to produce more effective results in many forms of disease, particularly allergies in which epinephrine is advised.

In Dec. 1939, a new product for the treatment of syphilis which can be taken by mouth was announced by Stanford university, where Hanzlik and his associates have developed a preparation of bismuth known as sobisminol, with which excellent results have been achieved. This product has been tested in the clinics and been found to have merit, so that it has now been accepted by the Council on Pharmacy and Chemistry of the American Medical Association.

A concentrate of thrombin has been found useful in direct application for the control of haemorrhage.

In certain cases of allergic response to food substances with resulting headache, the taking of a preparation of histamine has seemed to be of value in desensitization.

A new anaesthetic called cyclopropane, previously developed, was finally standardized, and its uses definitely restricted. The new anaesthetic is an inhalation anaesthetic like ether, but serves better than ether in selected cases.

Basic Research.—Fundamental research of the greatest importance concerned the work on the causation of high blood pressure or hypertension by Goldblatt of Cleveland whose investigations demonstrated the importance of conditions which interfere with the action of the kidneys as a fundamental cause of high blood pressure.

A new biologic effect was observed by Temple Fay, Smith and their associates in Philadelphia, who tested the effects of long-continued freezing on cancer tissue. Apparently freezing inhibits cancer growth, although at the same time it stops all of the activities of the body, so that the human being is in a state of hibernation. The method has been tested thus far only on incurable cases; the results have not been conclusive. However, much is being learned of the nature of the cancer cell, and the method is believed to be of importance as a means of biologic study.

Medical Apparatus.—Also of interest in the study of cancer was the use of the cyclotron, which is the new atom-smashing apparatus developed in the University of California. Human beings were treated with neutron rays produced by this device, with the idea that the rays will break down the wild self-reproductive cancer cells and thus bring about a remission in cancer.

A new oxygen mask was developed by Boothby of the Mayo Clinic for treating patients with sea-sickness and for use by aeroplane pilots and others at high altitudes.

Miscellaneous.—Medical attention centred largely during 1939 on improvement in preservation of blood for use in blood banks. Reports became available suggesting the use of preserved serum and preserved ascitic or dropsy fluid as a substitute for blood.

Elman of St. Louis suggested the feeding of patients with severe degrees of malnutrition with a solution of amino acids which could be injected directly into the veins.

Observers report the possibility of using such materials as walrus tusks, soup bones, and antlers of deer for bone grafts.

Special attention was given to the possibility of control of some forms of hardness of hearing by the use of some of the sex hormones.

Continued studies were made, notably by Hart of Duke univer-

HUMAN HIBERNATION was described at the annual meeting of the American Medical Association in May 1939. Ice lowers body temperature to 89°, after which the patient sleeps for five days, with only a slow heart beat. This treatment apparently stops growth of cancer

sity, on the importance of sterilizing air in operating rooms with ultra-violet rays.

Attention began to be paid to psychosomatic medicine, that is to say, those forms of disease which are definitely related to mental factors, including such varying conditions as asthma, high blood pressure and arthritis.

Studies were also emphasized which relate to the effects of weather and of geography on health.

Health Legislation.—Especially important were considerations given by the Senate to the Wagner bill for making effective the National Health bill.

The new Food and Drug laws and the Wheeler-Lea bill to control advertising of foods, drugs, cosmetics and physical devices became effective. Widespread and important changes began to be made in labels and in advertising copy in response to these laws and their enforcement.

Refugee Physician.—The problems of the refugee physician coming from abroad to the United States were given special consideration by medical organizations, by the State licensing boards and by charitable organizations concerned with the care of the refugees.

Care of the Aged.—The problem of the care of the aged, both from a physical and an economic point of view, attracted increasing attention. It is recognized that the difficult diets of the aged tend to give them a lessened amount of minerals and vitamin D, and a lessened absorption of these products which affects the bones adversely. This may be associated with the hunched or stooping attitude of the aged.

Motor Accidents.—Also important was the control of motor accidents with relationship to the physical condition and sobriety of the driver with standard plans for physical examination of those applying for driver's licence, the effects of a deficiency of vitamin A, and tests as to the amount of alcoholic intoxication prevailing in drivers of motor cars.

Nobel Prize in Medicine.—The Nobel prize in medicine was awarded to Domagk of Germany who is credited with having introduced the use of sulphanilamide.

Deaths.—Outstanding among deaths of physicians during 1939 was Dr. Harvey Cushing who won the Pulitzer prize for his *Life of Sir William Osler*, and is credited with having established surgery of the brain scientifically. Outstanding also were the deaths of the two famous Mayo brothers, Drs. William J. and Charles H.

Mayo, whose surgical accomplishments and organization ability made them recognized leaders in American medicine. Mediterranean, British Possessions in: see BRITISH POSSESSIONS IN THE MEDITERRANEAN.

Memel Territory, a long strip of land along the right bank of the river Niemen on the frontier of East Prussia, comprises 976 sq.mi., and a population of about 150,000. According to the German census of 1910 this region had a population of 140,766, of whom 71,191 spoke German as their mother-tongue, 67,345 Lithuanian, and 1,970 were bi-lingual. The Germans greatly predominated in the town and port of Memel, the Lithuanians in the rural districts. By the Versailles Treaty Germany was compelled to cede the Memel Territory to the four principal Allied Powers.

While they were delaying as to its final disposition, the armed forces of Lithuania suddenly hurst in and occupied it in January, 1923. The Powers accepted the situation but tried to regularize it by the Convention and Statute of May, 1924. Memel Territory was to be part of Lithuania but was promised large autonomy. Its Government was placed in the hands of a governor appointed by Lithuania; an elected chamber of representatives (*Landtag*); and a directorate of five.

Unfortunately racial hatred between Memellanders and Lithu-

anians prevented the smooth working of the Government. Lithuania tried to strengthen its hold on the territory by dismissing Germans from office, suppressing German newspapers, and expropriating German property owners to make place for Lithuanian farmers and business men. But these measures aroused great resentment and strengthened the German feeling. In 1935 Dr. Ernst Neumann and many other German Memellanders were accused of treason and condemned to long terms of imprisonment. Dr. Neumann, however, was released after a couple of years. He now created a unified German party with the slogan, "Back to the Reich." In the elections to the *Landtag* on Dec. 11, 1938, his party won a striking victory with 87.3% of the valid votes, while the Lithuanian tickets polled only 12.7%. Many persons expected that Hitler would use this electoral victory as a pretext for reuniting Memel with the Reich. Warned, however, by France and England to respect the Memel Statute of 1924, he did not do so until he had successfully annexed Bohemia-Moravia on March 15, 1939. Then he put pressure on Lithuania to cede the Memel Territory back to the Reich. Lithuania was too weak to resist, and on March 22, 1939, the Memel Territory was again a part of the Reich.

BIBLIOGRAPHY.—See Art. MEMEL in *Encyclopædia Britannica*; and Ian F. D. Morrow, *The Peace Settlement in the Polish-German Borderlands* (1936). (S. B. F.)

Mendelsohn, Charles Jastrow (1880–1939), U.S. philologist and authority on codes, was born at Wilmington, N.C. on December 8. After graduating from the University of Pennsylvania and taking post-graduate work there, he began as a tutor in Greek and later became an instructor in history at the College of the City of New York. During the World War he was employed by the U.S. Government as a translator and censor. In 1918 he was commissioned captain of the military intelligence division of the U.S. general staff and placed in charge of deciphering German codes. After the war he continued his research in codes and the history of cryptography and wrote, in collaboration with H. O. Yardley, *Universal Trade Code* (1921). He died at New York city on September 27.

Mental Diseases: see PSYCHIATRY.

Menzies, Robert Gordon (1894–), Australian statesman, was born December 20 and was educated at Grenville college, Ballarat, at Wesley college, Melbourne, and at Melbourne university, where he graduated with highest honours. After practising for several years as a harrister at the Victorian har he entered the Victorian parliament in 1928. During the next year he was a member of the legislative council of East Yarra, and from 1929 to 1934 he was a member of the legislative assembly of Nunawading. He was also (1932–34) attorney-general and minister for railways in the cabinet of Victorian Premier Argyle, and for a short time in 1934 was himself acting premier. In that year he was appointed attorney-general and minister for industry in the Australian cabinet of Joseph A. Lyons. Upon Lyons' death in 1939, Menzies was elected April 18 to succeed him as leader of the United Australia party, and two days later he received his commission to form a cabinet. Prime Minister Menzies announced in May that, as part of his foreign policy, he would seek better relationships with Japan. He also declared loyalty to the British foreign policy, and immediately upon the outbreak of war September 3 his cabinet approved a declaration of war against Germany. On September 15 he formed a war cabinet of six members, and on October 20 he announced the re-introduction of compulsory military training in Australia.

Mercer, Beryl (1882–1939), was born in Seville, Spain, the daughter of a diplomat and Beryl Montague

Mercer, well-known leading lady of the British Victorian theatre. She was educated at Guernsey college on Guernsey island and as a young girl became one of the most popular players of children's roles in Drury Lane productions. For a time she was under the direction of Sir Herbert Beerbohm Tree. She made her American debut at New York city in 1906 in *The Shulamite* and after a residence of three years in London returned again to the United States. In 1922 she went to Hollywood to act in motion pictures, but she returned frequently to the stage, notably in the Theatre Guild's productions of *Pygmalion* and *Right You Are if You Think You Are*. On the screen, as the "little old lady," she often personified eerie feminine characters with great effect. Among the pictures in which she appeared were *Three Live Ghosts* (1929 and 1936), *All Quiet on the Western Front* (1930), *The Little Minister* and *Jane Eyre* (1934), *Age of Indiscretion* (1935), *Magnificent Obsession* (1936), *Night Must Fall* and *Call It a Day* (1937) and *The Hound of the Baskervilles* (1939). She died at Hollywood, Calif. July 28.

Mercury. World production of mercury is estimated at 4,600 metric tons in 1937 and 5,200 tons in 1938, as compared with the record high of 5,610 tons in 1929. The leading producers are Italy, Spain and the United States; over the past 25 years, the distribution of the output has been one-third each from Italy and Spain (with Italy slightly in the lead), and one-sixth from the United States, the remainder being divided among a large number of minor producers, the chief of which are Mexico and the Soviet Union. The present distribution is not greatly different from this, except that Italy has taken a greater lead over Spain. Austria was formerly a producer on about the same scale as the United States, but in the readjustment of territory after the World War (1914-18) lost the producing district to Italy; without this addition to production capacity, Italy would rank below Spain, instead of above.

Italian production was 2,300 tons in 1938, but the rate declined somewhat in the first half of 1939. Spanish production has not been reported since 1935, but exports were about 1,400 tons in 1938. Sixty years ago the United States supplied two-thirds of the world total, but the highest figure in recent years was 860 tons in 1931, dropping to 330 tons in 1933, and increasing to 620 tons in 1938. United States imports in 1938 were only 81 tons, 47% from Italy, and 53% from Spain. British Empire production of mercury is limited to about 1 ton in Australia and New Zealand, but imports by the United Kingdom are heavy, the surplus of imports over re-exports in 1938 being 1,035 tons. German imports are still heavier, 1,132 tons in 1938. (G. A. Ro.)

Merit System: see CIVIL SERVICE.

Merrick, Leonard (1864-1939), British novelist and dramatist, was born Leonard Miller, February 21, and later changed his surname to Merrick. He was educated at Brighton college and at private schools. For a list of his works see *Encyclopædia Britannica*, vol. 15, p. 284. Merrick's novels never obtained a general popularity and he was known as a "novelist's novelist." In 1918 his books were reissued with introductions by some of the most famous authors of the day, including James M. Barrie, Arthur Pinero, Granville Barker, W. D. Howells and G. K. Chesterton. Merrick died at London on August 7.

Metallurgy. General features, equally applicable to various metals, that have occupied the attention of metallurgists during 1939 include fatigue, creep, age hardening, diffusion, and electrodeposition. Another phase is the wide-

spread attention that has been given to the so-called "powder metallurgy." Starting with the simple consolidation of pure metal powders by pressure and heat, this has now developed into a method of synthesizing a variety of alloys, both ferrous and nonferrous, from powders of the component metals.

Aluminium.—An interesting and potentially important new development is the use of a thin continuous strip of aluminium alloy as a base for motion picture film, which in use would operate by reflected light from the polished surface, rather than by transmitted light. The metal base has the advantages of faster processing, no stretching or shrinking, lower price, greater durability and strength, and the ability to use both sides of the film; furthermore, since the film is fireproof, the intensity of the illumination can be increased. A new bearing metal of aluminium, with 5.5-7% tin and smaller percentages of nickel, copper and magnesium, is reported to combine the desirable characteristics of white metal and copper-lead bearing alloys. (See also ALUMINIUM.)

Beryllium.—This metal received a great deal of publicity during the early months of 1939 through hearings of the Temporary National Economic Committee, which resulted in about 650 pages of published minutes, but apparently little else.

Copper.—A new smelter has been put into operation at Hurley, N.M., by Nevada Consolidated Copper Co., and plans are under way for another at Morenci, Ariz., by Phelps Dodge Corp. (See also COPPER.)

Iron and Steel.—There is a marked trend in the United States toward increased capacity in blast furnaces, up to 1,000 tons daily and more, as well as toward ore mixtures which will give a higher yield from the furnace. During the year the metallurgical department of the Jones and Laughlin plant at Pittsburgh announced the use of a battery of photo-electric cells with accessory apparatus to give precise control of the blowing of the bessemer converter by following the condition of the flame; this not only results in a more uniform product, but is also advancing knowledge of the oxidation process and of nitrogen absorption by the bath. This is the outstanding development of 1939 in steel metallurgy, as well as probably the most significant single step in the technology of bessemer steel since the discovery of the de-oxidation methods which made the process commercial, shortly after the invention of the process itself. (See IRON AND STEEL.)

Lead.—New features in 1939 are mainly the continued extension of former trends, rather than strictly new developments. Sintering machines have been increased in both length and width, and also separately in capacity without change of dimensions through careful control, especially of air leakage. A novel feature in blast furnace operation is being worked in a plant where a preponderance of gold and silver ores and a shortage of lead ores resulted in an insufficient lead fall for proper collection of the precious metals; this has been remedied by adding to the charge pig bullion, which is thus further enriched before going to the refinery. In refining, the process using gaseous chlorine has been extended to include the removal of tin. Several new alloys have been developed, including copper-tellurium-lead, tin-calcium-lead, and calcium-barium-lead. The addition of 2% magnesium to lead shot gives an alloy that completely disintegrates in contact with water in a few hours, and thus will serve to obviate lead poisoning in water fowl, caused from spent shot picked up from swallow water in feeding. (See also LEAD.)

Lithium.—A new source of comparatively large amounts of lithium (q.v.) has resulted from the by-product recovery of lithium salts from the potash operations at Searles Lake, California.

Manganese.—The electrolytic production of manganese (q.v.) has reached a stage where metal of 99.9% purity is being produced commercially.

Platinum.—Platinum-clad nickel sheets for use in chemical apparatus are now available in sizes up to four by eight feet.

Selenium and Tellurium.—A new development during 1939 is the use of selenium and tellurium in copper and copper alloys to improve the machineability of the product. Another new application is the use of selenium in a heavy-duty power rectifier which will withstand heavy overloads without deterioration.

Silver.—The addition of 0.25% silver to the standard 18-8 stainless steel is said to improve resistance to corrosion and pitting, to lessen the degree of work hardening, and to improve machineability; the new product has been made in castings, forgings, and sheets.

Using vaporization methods, silver coatings of the order of 0.00005 in. in thickness may be obtained; as a protective layer on an ordinary can the cost of silver would be only 0.05¢. Application of this protective layer to glass bottles has also been proposed, in order to protect the contents from the action of light, to reduce the effect of temperature through reflection of heat rays, and to retard the warming up of refrigerated materials, such as a beverage after being placed on the table. Silver has also been used in a magnesium alloy along with aluminium, zinc, and manganese, producing a high strength alloy with good corrosion resistance. Silver-tin alloys are also said to be receiving attention.

(See also SILVER.)

Tungsten, Tantalum and Molybdenum.—Efforts to reduce the consumption of tungsten in high-speed tool steels centre around the use of sintered carbides of tungsten and tantalum, and the substitution of part of the tungsten by molybdenum.

Zinc.—Work continues on the improvement in the yield from retort plants, one of which is now producing over 100 lb. of metal per retort daily. New extensions of plant capacity include a second unit of the New Jersey continuous retorts in Germany; a reflux plant, also in Europe; and extensions of plants for the electrogalvanizing of wire and sheets.

Continued technological improvements have been made in retort operation, recovery of volatilization losses from retorts, electrothermic distillation, and the recovery of cadmium, the latter serving the double purpose of increasing the output of cadmium and improving the purity of the zinc produced. (See also ZINC.)

(G. A. Ro.)

Metal Prices and Production: see MINERAL AND METAL PRICES AND PRODUCTION.

Meteorology.

The winter 1938-39 was characterized by abnormally high temperatures and above-normal precipitation in most sections of the United States although February was decidedly cold in central and western States. The season averaged above normal in warmth everywhere east of the Rocky Mountains.

Precipitation was much above normal in the eastern half of the United States and the Southwest, but was scanty in most Pacific sections. Snowfall was heavy in the northern Rocky Mountain States during the latter part of the winter.

Following the abundant winter precipitation, the spring months were generally warm and dry. Precipitation in March was scanty over a large northwestern area and April and May were decidedly dry throughout the Great Plains, so that by the middle of May

a rather severe drought had developed over a large midwestern section. Temperatures were abnormally high during the spring season.

The weather of summer was mostly favourable for agriculture. The spring drought that threatened to hold over into the summer was relieved by good, timely, and very beneficial rains the latter part of May and in June. Growing crops responded rapidly and developed satisfactorily in most of the principal agricultural areas. The summer was somewhat warmer than normal with only a few widely scattered areas having below normal temperature for the season as a whole.

The outstanding weather feature of 1939 was the severe fall drought. Following the mostly ample summer rainfall, a long, dry period set in the latter part of August and continued practically uninterruptedly until the close of the year. For the three fall months, September–November, only limited areas in the far Southwest and the middle Atlantic coast region had normal rainfall, with all other States having deficiencies. The relatively driest area extended from the central Mississippi Valley westward to the central Rocky Mountains. For the fall season Nebraska had only 26% of normal rainfall, and Kansas only 29%. It was the driest fall of record over large areas of the U.S., a long record at Minneapolis, Minn., showing the driest November in more than 100 years. The closing month of 1939 was remarkably warm everywhere until the last week when there was a reaction to abnormally low temperatures which carried subzero weather well into the Central valleys, and frost to the Gulf coast.

For 1939 as a whole the temperature for the United States averaged abnormally high, the means being remarkably similar to those for the preceding year. Practically all parts of the U.S. had a warmer than normal year, with the greatest abnormalities, about 4°, in the interior and central-northern portions of the Great Plains. The preceding year also was about 4° warmer than normal in these areas. The lowest temperature reported for the year was 51° below zero at Meadowlands, Minn., on February 21; the highest was 123° at Greenland's Ranch, Calif., on July 13. The record extremes for the United States are -66° and 134°, the former occurring in the Yellowstone National Park, and the latter in Death Valley, California.

Precipitation for 1939 as a whole was about normal east of the Mississippi river, and below normal practically everywhere to the westward. Alabama, with a State average of 59.33 in., was the wettest State, and Nevada with 8.45 in., the driest. Some central Rocky Mountain localities had the least annual rainfall of record. In general, there was considerably less precipitation in 1939 than in 1938.

Sunshine was above normal in most parts of the U.S., though

there was much more cloudy weather than normal in some areas, principally in the Central valleys and extreme Southeast. Many parts of the U.S. had from 100 to nearly 300 more hours of sunshine than is received in a normal year.

Storms, Floods, Etc.—While the number of tornadoes reported in 1939, 137, was near the average of 141 for the U.S. as a whole, most of the storms occurred in sparsely settled communities, making the loss of life and destruction of property less than in a normal year. While, on the average, tornadoes kill 265 people and destroy approximately \$12,000,000 worth of property annually, the loss of life in 1939 was only 97 and the property damage about half the average amount. The greatest loss of life for a single storm occurred at Center Point, Ark., and vicinity, on April 16, killing 27 people. (See also FLOODS AND FLOOD CONTROL.)

The general storm damage was also comparatively small. A tropical disturbance on September 24 and 25 in Los Angeles and vicinity resulted in the death of 45 people and damage to or destruction of property to the amount of some \$2,000,000. However, no tropical storm of consequence reached the south-eastern portion of the U.S. during the hurricane season of 1939.

(F. W. RR.)

Europe.—The values of monthly rainfalls and monthly mean temperatures in the tables are to be regarded as provisional, and subject to slight corrections. Blanks in the tables indicate that the corresponding data were not available (Jan. 1, 1940).

General Notes on the Weather of 1939. The north Atlantic was unusually stormy during January, and in consequence rainfall was above normal over a large part of northwest Europe. The first half of January was also one of the stormiest in recent years in the north Pacific. Stormy conditions over the north Atlantic

THE HEIGHT OF CLOUD CEILINGS can be measured in daytime by a new experimental detector with a photoelectric cell mounted at the focus of a reflector

persisted during the first half of February, and recurred in May. There was a long thundery spell over the British Isles in mid-July. At the end of December a severe earthquake in Turkey was followed by very heavy rainfall and severe flooding of many rivers, with heavy loss of life.

(D. BRU.)

Methodist Church. On May 10, 1939 at Kansas City, The Methodist Episcopal Church, The Methodist Episcopal Church, South, and The Methodist Protestant Church united to form The Methodist Church. The articles of religion of The Methodist Church are those which the three uniting churches have historically held in common.

The Methodist Church is organized into conferences. A General Conference for the entire church, meeting once in four years, has full legislative power over all matters affecting the total life of the church. It is composed of not less than 600 nor more than 800 delegates, ministerial and lay in equal numbers, elected by the Annual Conferences. The Annual Conference is itself composed of ministers and laymen, in equal numbers, representing the churches in a given area.

In the United States, there are jurisdictional conferences composed of delegates, ministerial and lay in equal numbers, elected by the annual conferences within their several boundaries. The jurisdictional conference meets within the 12 months succeeding the meeting of the General Conference. It elects its own bishops, promotes the evangelistic, educational, missionary, and benevolent interests of the church, and provides for interests and institutions within its boundary.

The church outside the United States is organized into central conferences that have powers and duties similar to those of the jurisdictional conference. A Council of Bishops composed of all the bishops of all the jurisdictional and central conferences meets at least once a year to plan for "the general oversight and promotion of the temporal and spiritual interests of the entire Church." At this meeting, the bishops of the central conferences may vote only on matters relating to their respective conferences. A bishop has residential and presidential supervision only in the jurisdiction that has elected him. On request of another jurisdiction, however, he may be transferred to that jurisdiction by the Council of Bishops.

In the Uniting Conference at Kansas City, the delegates from the Annual Conferences of the Methodist Protestant Church, which was non-episcopal, elected to the office of bishop two

ministers of their church who, being ordained at the conference, became effective bishops of The Methodist Church.

Women and youth have representation on nearly every board and commission of the church. The Board of Missions and Church Extension has general oversight over all the missionary enterprises of the church. It operates through four divisions: (a) division of foreign missions; (b) division of home missions and church extension; (c) Woman's division of Christian service; (d) joint division of education and cultivation.

Congregations of The Methodist Church, totalling 46,255, are now to be found in the United States, Cuba, Central America, Uruguay, Argentina, Chile, Bolivia, Peru, Austria, Belgium, Bulgaria, Czecho-Slovakia, Denmark, Estonia, Finland, Germany, Hungary, Italy, Yugoslavia, Latvia, Lithuania, Norway, Poland, Sweden, Switzerland, Union of South Africa, Portuguese East Africa, Southern Rhodesia, Angola, Belgian Congo, Liberia, Tunisia, Algeria, India, Burma, Sumatra, Sarawak (Borneo), Malaya, Philippine Islands and China. In Japan, Chosen, Manchuria, Brazil and Mexico there are autonomous Methodist Churches to whose support The Methodist Church contributes.

The membership of The Methodist Church is 7,856,060 (U.S. 7,492,935; other countries 363,125). Its Sunday schools, numbering 46,369, enroll 5,926,155 persons (U.S. 5,593,190; other countries 332,965). There are 65 bishops (effective and retired); 21,687 effective ministers and 15,969 local preachers; 2,000 deaconesses (U.S. 835; other countries 1,165); 5,592 home missionaries; 1,457 foreign missionaries (Asia 1,068; Africa 152; Latin America 225; Europe 12); 1,805 ordained native ministers and 16,500 unordained native workers. The 139 educational institutions of The Methodist Church enroll 93,000 students; its 83 hospitals, with 5,300 nurses, minister annually to 365,000 patients; its 115 "homes" care annually for 4,500 children, 3,200 aged persons, and 800 young people. It has, also, 40 homes for deaconesses.

The Methodist Church has property whose net value is \$656,474,867 (U.S. \$625,018,885; other countries \$31,455,982). It has permanent funds amounting to \$14,132,961.73; and annuity funds totalling \$7,313,458.06. Its current asking for foreign missions is \$3,980,504; for home missions, \$2,510,533. During a recent period of 12 months, it raised for ministerial support, debt payment, current expenses, general work, and benevolences a total of \$80,543,997. During this same period, it administered the rite of baptism to 309,949 persons and received 315,652 persons into full membership in the Church. A considerable portion of the funds of the American Church Committee for China Relief is now being administered across China by missionaries of The Methodist Church.

(E. F. T.)

Great Britain.—The annual conference of the Methodist Church met in Liverpool for a fortnight in July 1939, under the presidency of the Rev. Richard Pyke, a former president of the United Methodist Conference. The report of the National Children's Home and Orphanage showed that about £200,000 was raised in the year for this work.

The total number of full members of the Methodist Church in March 1939, was reported to the Liverpool conference as 802,455 (net decrease 2,177), with 18,338 "on trial," and 65,967 junior members. The number of lay preachers is 31,990. There are 980,005 scholars in the Sunday schools, but this figure represents a decrease of 23,795.

The report of the Overseas Missions issued in June 1939, shows an adult baptized Christian community of 223,487 recognized as full members of the church, an increase of 3,732 on the year. There are in addition 39,042 baptized adherents, and 189,826 on trial for full membership, and 220,227 children in the Sunday schools. The total Christian community under the care of the Methodist Missionary Society, in the West Indies, Ceylon, India,

Burma, China, Africa and Latin Europe is 752,406. All these figures show great increases, even if the home church has nothing comparable to report. The Missionary Society is without a debt. The total income raised for its work by the home church was £317,849, and by the churches on the mission fields, £116,029. The total income of the Missionary Society was £482,726.

BIBLIOGRAPHY.—The above figures from Methodist Conference *Minutes* (1939) and *Annual Report* of the Methodist Missionary Society for 1938, issued June 1939. (J. R. J.)

Metropolitan Museum of Art: see ART EXHIBITIONS.

Mexico, a Federal republic, between the United States and Central America and bordering the Pacific and Atlantic (Gulf of Mexico); language, Spanish; capital, Mexico City; president, Lázaro Cárdenas; area, 767,168 square miles. Population (census, 1930) 16,552,722; (official estimate, 1935) 18,512,837. In 1930 approximately 55% of the population was mestizo, 29% Indian, and 15% white, with less than 1% (150,000) foreign. Approximately 14% of the total population speaks only Indian tongues. There are some Negro and part Negro elements on the Gulf of Mexico coast. The chief cities are: Mexico City, 1,029,068; Guadalajara, 184,826; Monterrey, 137,388; Puebla, 122,914; Mérida, 110,183.

History.—Mexico includes 28 States, each with its own governor and legislature and a limited autonomy, and three territories and a Federal district, with governors appointed by the president. The national Government is administered by a president elected for six years, and a bicameral congress. Members of the Chamber of Deputies are elected for three years and of the Senate for six years, by universal suffrage.

In 1939, developments in Mexico were hampered by stringent economic conditions brought about by a sharp fall in the price of silver, which caused the peso to slump to a new low, and by external pressure on the Government-owned petroleum industry. The European war, disrupting maritime commerce, had disastrous effects on Mexico's markets abroad. Land expropriation and redistribution continued, but the revolutionary social program was overshadowed by the economic crisis and by political activity leading toward the election of a president in 1940 to succeed Lázaro Cárdenas, whose term ends in December of 1940. Administration and opposition party candidates were selected. Foreign relations were concerned with the oil controversy between the Government and the foreign companies whose properties were expropriated in March 1938, and with international conditions arising from the wars in Europe.

The petroleum industry revived remarkably from its depression in 1938, when boycotts in protest of expropriations seriously limited foreign markets. In the first seven months of 1939, production was up 15% and the Government was marketing oil in pre-expropriation quantities, chiefly through barter agreements with Germany and Italy.

In September, however, when the German market, which had been taking 42% of the exported product, was eliminated by war, sales were cut in half. As no new outlets were found, storage scarcity resulted, and it was necessary to curtail production in the closing months of the year. Expected benefits of a United States 50% tariff reduction on oil, effective December 16, did not materialize, for Mexico's quota, determined by her 1938 oil sales to the United States, was only 3.8%. (See also PETROLEUM; UNITED STATES.)

The petroleum administration, known as Petroleos Mexicanos, was further centralized, and steps were taken to nationalize additional properties. In November the Constitution was amended to prohibit the granting of petroleum concessions to private companies in the future. On December 2, the Supreme Court declared

the 1938 expropriations legal, admitting the right of the foreign companies to claim compensation "for capital directly and legitimately invested," permitting the Government to defer payment for as much as ten years, and ruling out reimbursement for the companies "for an expectation of profits from oil still in the ground or for damage suffered through cancellation of concessions." The decision, surprising to neither party involved, exhausted all legal recourse for the companies and the Government prepared to evaluate the properties for compensation as the year closed.

Mexico experienced a third year of economic depression in 1939. Business during the early months was on an upward trend, but in June a slump in silver value abroad brought about a financial crisis. The United States treasury, which had been buying Mexican silver at 43¢ (U.S.) an ounce, lowered the price to 35¢, and the Mexican peso immediately fell from 4.99 to around 6 to the dollar, fluctuating between the two figures for the rest of the year. A rise in the price of foodstuffs and other domestic necessities, in spite of governmental counter-measures, created an acute situation among the people of the nation.

Labour disputes continued throughout the year with strikes against both foreign and Mexican companies. Even school teachers and Government employees struck for higher wages, back salaries or better working conditions. A 12-day bakery strike in the capital, causing a serious bread shortage, was settled April 10 by compromise. In October, five States were temporarily darkened by an electric power and light strike.

A shortage of water power in the Federal district caused the Government to inaugurate a drastic program of electricity conservation from February until July, when summer rains alleviated the situation. Inadequate transportation facilities created serious congestion in the port of Veracruz in April, and elsewhere freight was held up by similar difficulties. The Government continued to subsidize corn, beans and other foodstuff importations in the early months, but summer grain harvests were exceptionally good.

No major expropriations of private industries occurred during the year, but Mexico's drive toward "economic independence" was strengthened in August by legislation restricting property acquisition by foreigners. A steeply-graduated excess profits tax passed the Chamber of Deputies December 22. To stimulate investments, however, a Government fund to guarantee capital and minimum interest on all sums invested in specified industries was approved by Congress for 1940. The fund was to be created from the proceeds of a tax on alcoholic beverages for the next five years.

Mining, the nation's most important industry, suffered from the silver slump and failed to revive as expected during the European war. Copper prices rose 20% in September, but lead and zinc fell in export value and volume as Great Britain confined her purchases to sources within her empire. The 12% export tax on silver was removed to stimulate the industry.

Mexico's political scene was dominated by preparations for the July 1940 presidential election. Bidding for the official National Revolutionary Party's nomination were generals Manuel Ávila Camacho, former minister of war and unofficial choice of the administration; Rafael Sánchez Tapia, a moderate; Francisco Mujica, a leftist; and Gildardo Magana, an administration supporter. Mujica and Magana withdrew and, on November 3, Ávila Camacho was chosen unanimously as the official candidate by the party convention. Rightist opposition factions formed the new National Party of Public Salvation in March with General Joaquín Amaro as a potential candidate. In July, however, Juan Andreu Almazán, recently retired military commander of the North and a popular moderate, declared himself against the administration and became by far the leading opposition figure. After the official

party's nomination, there was a lull in campaign activities while both Ávila Camacho and Almazán conserved their political energies for the ensuing year.

Strongly supported by the official party, which has dominated Mexican politics for ten years, Ávila Camacho was conceded the 1940 election by many observers. Almazán's large popular following, however, with President Cárdenas's promise of a fair election, gave the opposition candidate a chance to win. Almazán's platform, vaguely stated in July, called for breaking down bureaucratic politics, putting the agrarian revolution on a private ownership basis, and further aiding national recovery by close co-operation with the United States. Ávila Camacho's program tentatively drawn up in the official party's new "Six-Year Plan," included the complete nationalization of the oil industry and continued land expropriation and redistribution, but also co-operation with private industry and "gradual reparation of social injustices."

After four years of remarkable political strength and popularity, President Cárdenas suffered some loss of prestige during 1939. In the face of pressing national problems, keenly felt in the capital, he left on an extended trip through the North to look after regional economic and social needs. Gone 97 days, the President travelled through ten States and territories, visiting 252 localities and thereby increasing his political strength in that region. In the capital, however, political and economic unrest was voiced in the election campaigns, and the administration came under sharp criticism.

Minor insurrectionary disturbances continued throughout the year in the various States, but Federal troops quickly suppressed them. In January, the seven-months' hunt for General Saturnino Cedillo, leader of the short-lived revolt in San Luis Potosí in 1938, ended when the rebel chief was killed in a skirmish between Federal troops and his few remaining followers. In Mexico City, anti-Semitic, anti-Fascist, anti-Nazi and anti-Communist riots occurred, but were suppressed by police. Unrest centred about such issues as the admission of Jewish refugees from Germany, Republicans from Spain, and Mexicans from the United States, and repercussions from the various wars in Europe. In December, the Communist minority was sharply criticized for denouncing the President's condemnation of Soviet Russia's invasion of Finland.

A new national census was begun during the year with completion expected in 1940.

Social reforms went forward steadily in 1939 in spite of economic adversity. The Government continued to support labour and agrarian movements, to carry socialized education into the remote Indian villages, and to spend huge sums on irrigation projects. Jewish refugees from Germany were refused admission into Mexico, but immigration restrictions were relaxed to allow several thousand Spanish Loyalists to enter the country, and a few thousand Mexicans of the first and second generation residing in the United States were repatriated. Most of these immigrants were colonized in undeveloped regions.

Agricultural land expropriations continued, especially affecting large sugar estates. During the fiscal year ending Sept. 1939, the Government made 1,317 land grants totalling more than 6,000,000 ac. to 106,829 farmers. Almost 40,000,000 ac. of land, formerly held by large estates, have been redistributed to peasants in communal holdings during the agrarian revolution. President Cárdenas in 1939 set a goal of 50 ac. for each of Mexico's 3,000,000 peasant families.

There was no noticeable religious unrest as in past years. The Catholic church continued to operate peacefully under Government supervision.

Foreign Relations.—Diplomatic relations with Great Britain remained suspended over the petroleum expropriation controversy,

but negotiations between the Government and the American companies were active. Attempts to reach a settlement by reinstating the foreign companies on a joint-operation basis with the Government failed, however, and Mexico showed no inclination to relinquish control of the industry. After the expropriation ruling was upheld in the Mexican Supreme Court December 2, the dispossessed American companies appealed to their own Department of State. As the year ended, however, no official action by the United States was forthcoming.

Mexico took definite stands on almost all major military aggressions in Europe. In the Spanish civil war, Mexico actively supported the Republican cause but, in July, assumed normal relations with the victorious Franco Government. The Government continued to recognize Poland and Czecho-Slovakia after they were conquered, but, in September, declared its neutrality in the European conflict. In the next month it became a signatory party to the inter-American agreement at Panama, which established a neutrality belt around the American waters, and restricted the activities of ships of belligerent nations by coast guard patrols on both shores. (See HISPANIC AMERICA AND THE EUROPEAN WAR.) As a member of the League of Nations, Mexico denounced Soviet Russia's invasion of Finland in December and pledged her aid to Finland.

Education.—Urban education is supported largely by the States; rural education by the Government. There are approximately 20,000 schools of all kinds in the country. The Government is striving to lower Mexico's large percentage of illiteracy (officially estimated at 45%) by spreading primary education among the Indians. In 1938, the Government maintained 12,245 rural and 1,846 urban elementary schools, with 15,714 teachers and 811,790 students in the former and 10,143 teachers and 368,414 students in the latter, at a cost of 67,260,000 pesos. The 1939 budget provided 67,075,000 pesos for education. There are six universities including the National Autonomous university and the National Labor university, both at Mexico City.

Banking and Finance.—The monetary unit is the peso (value: 17.35¢ U.S. in 1939, with parity not yet determined; 20.3¢ in 1938). When the price of silver abroad fell from 43¢ to 35¢ (U.S.), the Bank of Mexico retired from the market and let the peso seek its natural level. The national budget for 1939, largest in Mexican history, called for 445,875,614 pesos (430,920,000 pesos in 1938). Receipts for the first eight months were up 12.3% from the estimated 300,000,000 pesos for that period.

Trade and Communications.—Exports in 1938 totalled 838,126,000 pesos (6% less than in 1937), of which mineral products, principally silver, gold, lead and petroleum, constituted 499,027,228 pesos (or 59.6%), including gold bullion. In the first half of 1939, exports increased in value to 490,300,000 pesos (423,100,000 pesos in the same period of 1938). The principal customer is the United States which took 67.4% in 1938. Great Britain was second (9.4%).

Imports in 1938 totalled 493,323,784 pesos, with automobiles, rayon yarn, machinery and other manufactures the principal commodities. In the first six months of 1939, imports had increased to 306,100,000 pesos (237,100,000 in the same period of 1938). The United States supplied 57.8% of the imports in 1938. Germany was second (18.8%). The devaluation of the peso during the year caused a slight increase in pesos spent and collected as compared with the actual amount of goods exchanged. A significant drop in trade with Germany after war broke out in September offset Germany's gain by previous barter agreements on the trade of the United States and Great Britain.

Mexico's external communications are by steamship service, especially through Veracruz, by three main railways to the United States, and one to Guatemala; by increasingly important air serv-

ice north and south and to the West Indies; and by highway, notably through Nuevo Laredo. There are over 23,750 km. of railway, 57% of which is under Government operation. During the fiscal year ending Sept. 1939, 171 km. of rails were laid on a line which will link Baja California with the rest of the country, 265 km. on the Southeastern line, and 83 km. on the projected Uruapan-Puerto Zihuatanejo road. Highway building during the year 1938-39 included the completion of the 680-km. paved road from Mexico City to Guadalajara. Including projects in co-operation with the States, the Government surveyed 936 km. of new roads, laid beds for 686 km., and surfaced 1,525 kilometres. Among the new airlines established in 1939 was one between Mexico City and Tampico. An airmail service between Mexico City and Bridgetown, Barbados, was also opened. In 1938, Mexico had over 23 lines of air passenger service. In the same year, there were 138,081 telephones (1,337 Government and 136,744 private). During the fiscal year 1938-39, the Government spent 17,976,589 pesos on railway construction, 11,681,717 pesos on highways, and 997,525 pesos on aeroplanes and equipment.

Agriculture and Mining.—Resources are mineral and agricultural. Holding sixth place in world petroleum production, Mexico produced 38,506,000 bbl. in 1938. The 1939 output was estimated at 41,700,000 bbl., an increase of 8.3%. Mexico is the leading producer of silver (2,520,155 kg. in 1938). In the first eight months of 1939 silver production was down 20.2%. Other important minerals include gold, copper, lead and zinc.

Normally almost self-sufficient agriculturally, Mexico suffered a shortage of corn, wheat, beans, and other such produce in the early months of 1939, but good crops were harvested in the summer. The 1939 wheat crop attained the all-time record of 385,000 tons, and corn prospects pointed to a similar record. Important exports are coffee, henequen (hemp), bananas, chicle and chick-peas.

The cattle industry is important in the northern States. Manufactures include sugar and oil refining, textiles, tobacco products, iron and steel, rubber, leather, glass, flour and meat packing. The fishing industry is important on the west coast. A recent national resource is the tourist trade, which revived after a poor previous year. In the first ten months of 1939, foreign visitors entering Mexico numbered 49,287 as compared to 40,130 in the corresponding period of 1938.

Army and Navy.—Mexico's largest appropriations are for national defence (92,984,458 pesos in 1939). The standing army is unofficially estimated at 70,000 men, with 40,000 in reserve. A program is under way to train peasants and thus bring the reserves up to 200,000 in four years. The army had 170 pilots and 70 planes in its air service in 1938, and in 1939 Government contracts called for 40 fighting planes and ten training ships. The navy consists of one coast defence ship, eight gunboats and nine coast guard craft. (See also INTERNATIONAL LAW.)

Mica. In the discussion of mica we are mainly concerned with sheet mica; although there are many commercial uses for scrap mica, this is a low grade material that falls into a different category from that of sheet mica. Sheet mica is classified according to the standard size of sheet that can be trimmed to shape, and that below the smallest size, but still too large for scrap, goes to splittings, for the production of built-up mica shapes, using a plastic binder. The growing demand for built-up mica has made splittings a feature of the market, with a consumption in the United States about double that of sheet mica.

Of a world total output of about 50,000 metric tons in 1937, apparently about 10,000 tons were sheet and splittings, and the remainder scrap. Production declined rather sharply in 1938 in practically all countries. The output of British India stands foremost, with mainly sheet and splittings, but in recent years considerable amounts of scrap have apparently been included, so that the data available have little meaning. Other British Empire producers include Canada, Rhodesia, South Africa, Tanganyika and Australia, but none of these are of any great commercial importance except Canada, and there output has declined heavily in the past decade.

United States production has likewise dropped, but not so badly as the Canadian; an output of 847 short tons of sheet and 25,200 tons of scrap in 1937 declined to 470 tons of sheet and 20,250 tons of scrap in 1938. Imports dropped by about half in 1938, to 4,530 tons of scrap and ground mica, 175 tons of sheet, and 890 tons of splittings.

Heretofore mica has lacked any satisfactory substitute for its most important uses, but a recent announcement makes public the discovery of an artificial film made from bentonite which gives promise of serving for many of the ordinary electrical uses of mica, but due to a high power factor it has not yet been developed to a point where it can be used in high grade condensers. (See also VERMICULITE.) (G. A. Ro.)

Michigan, twenty-sixth State to become a member of the United States, popularly known as the "Wolverine State"; area, 57,480 sq. mi. (exclusive of 40,000 sq. mi. of Great Lakes' water surface within her boundaries); population (U.S. census, 1930) 4,842,325; (estimate Jan. 1, 1940) 5,405,000. Capital, Lansing, 78,397. Larger cities are Detroit, 1,568,662; Grand Rapids, 168,592; Flint, 156,492; Saginaw, 80,715. Of the State's population, 3,302,075 are urban, or 68.2%; 4,650,171 whites; 192,154 coloured; of the whites, 3,809,903 native born, 840,268 foreign born; about 350,000 of the total population live in the upper peninsula, which comprises about one-fourth of the State's area and possesses nearly one-half of the State's 1,624-mile shoreline (longest fresh-water shore line of any State in the Union).

History.—The beginning of the year witnessed the inauguration of a Republican administration to succeed the "Little New Deal" of the Democratic regime under the outgoing governor, Frank Murphy. Under his successor, Frank D. Fitzgerald, who had been secretary of State (1931-34) and governor (1935-36), it soon became evident that the Republicans were planning sweeping changes not only in the practices inaugurated by the Murphy regime with respect to economic and social problems, but in the recently established Civil Service program, as well. Almost immediately, however, the Fitzgerald administration was embarrassed by widespread publicity given to the opening of numerous gambling establishments in the State, particularly in the neighbourhood of Detroit. Several of the influential newspapers which had vigorously supported Fitzgerald in his fall campaign against Murphy now led an insistent demand that the State police be used to suppress the gambling. Fitzgerald, taking the position that the problem was one for county, rather than State, handling, at first declined to order suppression by State police except in instances where local authorities professed inability to handle the matter. In the face of persistent popular clamour, however, the governor in March finally ordered the State police to clean up the gambling situation.

Governor Fitzgerald died, after a brief illness, on March 16. On March 17, Luren D. Dickinson, who as a candidate for a seventh term as lieutenant-governor (previous terms, 1915-20; 1927-32) had led the Republican ticket in the November election, took the oath of office as Michigan's 54th State governor (the 37th indi-

vidual to hold the office). Seventy-nine year old Dickinson had long been known as an active leader of the Anti-Saloon League; his inaugural address as lieutenant-governor had inveighed against "the encircling odours of the seething, boiling, sin-cursed cesspools of crime, insanity, idleness, social putridity, gambling dens, profligacy, waste, industrial upheaval, beer gardens, and road houses. . . ." Even these activities had scarcely prepared the public for the vigour and enthusiasm with which the new governor engaged upon an oratorical campaign against sin as he saw it. This campaign has made Dickinson probably the best-known, certainly the most talked-about, governor in Michigan's history. Severe criticisms by the governor of moral conditions as he found them at a governors' conference in Albany, N.Y., during the summer, drew forth comment from every part of the country, while his colourful account of the temptations of New York city provoked a retort from Mayor Fiorello La Guardia. Before long Michigan people had become used to the governor's claim that he had "a pipeline to God," and suggestions of the order of his proposal that smoking mothers reduce their expenditures for cigarettes by one-half and donate the savings to the depleted State funds for relief failed to arouse much comment. Political observers, however, were impressed with the uniformly large audiences attending the Sunday religious rallies addressed by the governor in various parts of the State.

Meanwhile the State legislature, in a session lasting until the middle of June, had passed nearly 370 measures. Perhaps the most important was a new civil service bill, to take the place of the one passed during the Murphy regime. Although Republican leaders insisted that the principle of civil service was being adhered to, the Michigan Merit System Association and a host of other non-partisan organizations were bitterly opposed to the new measure. The measure removed from the civil service about one-half of the 16,000 positions which had been under civil service at the beginning of the year. A great deal of pressure, much of it non-partisan in character, was put upon Governor Dickinson to veto the measure, but he signed it. An oil control act drafted by the Department of Conservation and sponsored by the Oil and Gas Association of Michigan was described by State Geologist R. A. Smith as the best legislation of its kind in the nation. Other acts passed by the legislature made a new requirement of oath of allegiance of teachers, instructors, and professors; provided for the raising of standards for nurses; abolished the Legislative Council established in 1933. Twenty-one bills were vetoed by the governor; three were passed over his veto. Harold D. Smith, who resigned as State budget director to become director of the Federal budget, was succeeded first by Grover C. Dillman, and then by Gus T. Hartman. In the place of William Brownrigg, who resigned to accept the position of director of personnel in the Federal Department of Justice, Paul T. Anderson became State personnel director of civil service. Richard T. Frankenstein, C.I.O. leader, whose appointment by Governor Murphy to the State Emergency Relief Commission had provoked much criticism, was replaced by Governor Fitzgerald with Carleton H. Runciman.

Measures of administrative reorganization undertaken by the legislature were accompanied by a program of sweeping changes inaugurated by Governor Fitzgerald and continued by Governor Dickinson with respect to the personnel of appointive offices. The Public Utilities Commission, which Governor Fitzgerald alleged was partisan, was abolished by the legislature and replaced by a Public Service Commission. Replacing a social welfare act which had been nullified by popular referendum in the Nov. 1938 election, a new law created a State Social Welfare Commission which was directed to co-ordinate all the various responsibilities and obligations of the Emergency Welfare Relief Commission, the State Welfare Commission, the Old Age Assistance Bureau, and other

State and county agencies. Walter F. Gries became chairman of this commission. Under terms of the new act, the principal responsibility for the administration of relief was placed upon the county social welfare board. Due in part to resignations, the personnel of the Civil Service Commission was completely reconstituted, with William A. Irving the new chairman. Before the end of the year, the State Liquor Control Commission had been simi-

larly completely changed in membership, with Orrin A. DeMass the new chairman. Melville B. McPherson became chairman of the State Tax Commission; the resignation of one of the Democratic members gave the Republicans control of the commission. Brigadier General Edward G. Heckel succeeded Hilmer Gellein as director of the Department of Corrections; new wardens were appointed for the State Prison of Southern Michi-

LUREN D. DICKINSON became governor of Michigan in March 1939

igan and for the Michigan Reformatory. Dr. H. Allen Moyer, Governor Dickinson's personal physician, replaced Dr. Don W. Gudakunst as State health officer.

In the spring election, the Republican party swept to complete victory. Henry M. Butzel and Howard Wiest were re-elected justices of the State Supreme Court, and Eugene B. Elliott was re-elected State Superintendent of Public Instruction. Junius A. Beal and Ralph Stone, Republicans, who after serving 32 years and 16 years, respectively, as regents of the University of Michigan, chose not to stand for re-election, were succeeded by Harry G. Kipke, formerly football coach of the University, and J. Joseph Herbert. Melville B. McPherson and Forest M. Akers were chosen to replace Democrats on the State Board of Agriculture, while the election of Mary Farnsworth as a member of the State Board of Education made that body completely Republican in personnel.

Education.—Under the superintendency of Eugene B. Elliott, the State Department of Public Instruction continued to place particular emphasis upon vocational guidance and upon the development of a State-wide curriculum program. A committee was appointed to formulate a program in conservation education for Michigan schools. The institutions of higher learning in general reported increases in enrolment. At Michigan State college in East Lansing important buildings were erected for class-room, for athletics, and for dormitory purposes; at the University of Michigan in Ann Arbor a \$5,500,000-building program, with particular emphasis upon the construction of dormitories, was carried through.

Charities and Correction.—The brief age (six months) of the recently created Social Welfare Commission rendered impossible any accurate appraisal of its effectiveness in dealing with Michigan's complex \$45,000,000-a-year welfare and relief problem; in view of the fact that county "home rule" administration of relief did not come into being until December 1, the probability of success of this plan was at the end of the year still entirely a matter of conjecture. The Department of Corrections reported that from January 1 to December 1 the number of prisoners incarcerated in State penal institutions rose from 7,299 to 7,722. As of June 30, 91% were native-born Americans, 43% Michigan-born.

Banking.—F. Elliott, Jr., State Banking Commissioner, at the end of the year reported that the resources of 351 commercial banks under his supervision increased from \$701,000,000 to

\$747,000,000 during the year; deposits from \$635,000,000 to \$677,000,000. Of 64 receiverships supervised by the State Banking Department in 1933, only 22 were still in existence at the end of 1939; 20 receiverships were closed during the year.

Agriculture, Manufactures, Mineral Production.—During 1939 the State Department of Agriculture under Elmer A. Beamer continued a program working toward the elimination of animal diseases, especially among dairy herds, and of American Foul Brood among bees; the analysis of agricultural seeds; the inspection of orchards and nurseries. In the automotive and construction industries in particular, marked gains in business were reported. The longest and costliest labour dispute in automotive history, a 54-day deadlock between the Chrysler Corporation and the C.I.O. United Automobile Workers reached a close at the end of November with a compromise including a wage increase amounting to over \$5,000,000 a year.

Nearly 1,500 drilling permits for oil and gas were issued during 1939. Output of the iron mines on the Marquette iron range showed an increase toward the close of the year; the outbreak of war in Europe stimulated the copper mining industry, also. By the end of November over 68,000,000 tons of shipping had passed through the locks at Sault Ste. Marie, an increase of approximately 29,000,000 tons over the corresponding period of 1938.

Michigan, University of. Construction of the new buildings provided with the help of the Federal Public Works Administration was the most important problem before the University of Michigan in 1939. The building program included a large quadrangle of men's residence halls, housing 932 men, a second smaller quadrangle for 400 men, a dormitory for medical students, a home for hospital interns, a women's dormitory housing 392 women, a new building for children's and post-graduate dentistry, and a student health service with hospital facilities. In addition the heating and power plant had to be increased to care for the new buildings. The administration of university residence halls, except those for which special provisions are made in the deeds of gift, has been committed to a board of governors and a director of residence halls. The house plan adopted by the governors looks forward to making the student's experience a genuine contribution to his or her education, broadly conceived in terms of general culture and communal living.

In June 1939, it was decided to transfer the Department of Landscape Design, formerly part of the College of Literature, Science, and the Arts, to the College of Architecture, and to change its name to "Department of Landscape Architecture." The name of the college, also, was changed to "College of Architecture and Design" in order to recognize the growing importance of the curriculum in decorative design. (A. G. R.)

Midway Islands, a group of two small islands and several sand islets in lat. 28° 13' N., and long. 177° 23' W., 1,149 miles N.W. of Honolulu, belonging to the United States of America. The larger is Sand island; about 850ac.; maximum height above sea level, 43 feet. The other is Eastern island; about 328ac. and very low. The islands are enclosed in a circular reef about five miles in diameter, about four-fifths of which is above water. There are no native or permanent inhabitants.

The group was discovered in 1859, by Captain Brooks, bark "Gamhier," who took possession in the name of the United States. Captain Reynolds, U.S.S. "Lackawanna," took possession formally on Aug. 28, 1867.

Since 1903 the islands have been under the jurisdiction of the U.S. Navy Department. Sand island is the site of a commercial cable station. The Navy Department has licensed Pan American Airways to establish certain facilities for use in connection with its transpacific commercial airline.

The 76th Congress authorized the Navy Department to construct a seaplane base at Midway and appropriated approximately \$5,000,000 for the purpose. The work, involving dredging for a turning basin for tenders and oil tankers, ramps, barracks and administration buildings and public works to accommodate permanently one squadron of patrol planes and 300 men, was in progress (Jan. 1, 1940). (L. S. F.)

Milk. The canned milk business, a highly profitable "war baby" among industries between 1914 and 1918, revived suddenly with the outbreak of hostilities in Sept. 1939 and during the month wholesalers reduced manufacturers' stocks of evaporated milk to the lowest point since 1922. Prices of condensed and evaporated milk advanced on the belief that war would again create a huge demand for this highly compact, non-perishable and easily transported food.

Condensed milk output had declined, in comparison with 1938, every month from Feb. to Aug. 1939, but increased when war became imminent. Evaporated milk output, which had roughly paralleled 1938 production, was stepped up sharply in September. From January 1 to September 30 production of condensed milk in the United States was 175,130,000lb. and 195,412,000lb. in 1938. In the same period manufacture of evaporated milk was 1,753,056,000lb. in 1939 and 1,737,479,000lb. in 1938. Stocks in manufacturers' hands Oct. 1, 1939 and 1938, and the five-year average (1934-1938) were:

	1939 lb.	1938 lb.	Five-year average lb.
Condensed milk	13,780,000	27,055,000	24,461,000
Evaporated milk	135,135,000	308,287,000	260,938,000
Dry milk (skim)	11,931,000	52,702,000	35,129,000

The milk flow in 1939 in the United States was slightly under 1938 owing to dry weather during the summer in some areas. On September 1, however, production per cow was again almost at the record figure of 1938 for that date, according to farmers who make crop reports to the Department of Agriculture. The number of heifer calves kept for production increased. (See DAIRYING.) The year 1939 was one of wide-spread dissension in the milk industry. A strike of milk wagon drivers disrupted deliveries in New York. The Department of Agriculture set up local milk control boards to foster agreements under which producers would receive a fairer price. Although this arrangement, which established zone prices per 100lb. in milk sheds, provided a higher price to farmers, it was not entirely satisfactory. Some producers complained that no difference was made in price between milk of high butterfat content and milk of the minimum allowable fat content. The Federal Government prosecuted in Chicago an action against milk distributing companies, the Pure Milk association of 12,000 farmers in Illinois, Indiana, Wisconsin, and Michigan, the Milk Wagon Drivers union and officials of the Chicago Board of Health. These defendants were charged with combining to fix prices, control supply and suppress competition. Judge Charles

"SOME JUMP" is the title of Jensen's complaint in *The Chicago Daily News* against the rise of retail milk prices in 1939

Woodward of the Federal court ruled that other acts of Congress had removed the marketing of farm products from the jurisdiction of the Sherman Anti-Trust Act.

(For the milk situation as to dairy herds, see DAIRYING.)

(S. O. R.)

Milk Containers, Paper: see CELLULOSE PRODUCTS.

Miller, Joseph Dana (1864-1939), American economist, was the leading exponent of the Single Tax movement after the death of Henry George in 1897. Born in New York city on July 1, he was educated by private tutors and had written many published verses and critical articles before he met George and became a fervent convert to the latter's doctrine of limiting taxation to land. In 1901 he founded the *Single Tax Review* (later *Land and Freedom*), international journal of the Single Tax movement, which he edited for 38 years. Miller published two collections of poetry, *Verses from a Vagrant Muse* (1894) and *Thirty Years of Verse Making* (1926). He died at Jersey City, N. J., on May 8.

Mineral and Metal Prices and Production.

The first of the accompanying charts shows the range of prices for the leading metals and minerals during 1939 on the New York and London markets. The outbreak of war in Europe caused prices to advance, but this was largely confined to commodities in the strategic materials group, others showing little change; however, since the British strategic group is much larger than the American, the general effect on the market was correspondingly greater, but control of prices for all important commodities was put into effect by the British Government before the market could be seriously affected. In the United States there was a general decline of prices through the first half of the year, the *E&MJ* index of non-

Mineral and Metal Prices in 1939

ferrous metal prices declining from 77.12 in January to 71.95 in August, followed by a rise to 84.25 in October and a decline to 82.89 in December. The average for the year was 77.71, against 73.67 in 1938 and 90.86 in 1937.

The second table gives the 1938 mineral and metal production for the more important producing countries and the leading commodities, in addition to which production data will be found in the treatment of many of the individual subjects throughout the volume. The *Mineral Industry* index for aggregate world mineral production dropped to 139 in 1938, from 150 in 1937; such preliminary data as are available for 1939 indicate a recovery, but probably not to the level of 1937 unless war demand materially boosts output in the last quarter. (G. A. Ro.)

Mineralogy. As retiring president of the Mineralogical Society of America, Thomson reviewed the history of the study of ore minerals (*American Mineralogist*, March). The new minerals teepite, gratonite, overite, goldschmitine, salesite and shortite were described (*ibid.*, January, February, March, April, June and August). Extensive studies on the properties of the mica minerals were made by Volk, Gruner, Hendricks, Jefferson (*ibid.*, April, October, December) and Wright (*American Journal of Science*, October). Simpson reported on new and little known meteorites of Western Australia (*Mineralogical Magazine*, No. 163). Other meteorites were described as follows: the Soper, Oklahoma, by Wood and Merritt; Rosebud, Milam county, Texas, by Bullard; Santa Luzia de Goyaz, by Meen (*American Mineralogist*, January, April, September); Wood's Mountain, North Carolina, by Perry (*American Journal of Science*, August); and Huckitta, by Madigan (*Mineralogical Magazine*, No. 165). Important new methods for mineral determination were reported: electric counter, by Hurlbut (*American Journal of Science*, April); specific gravity, by Jahns, Berman, and Ksanda and Merwin (*American Mineralogist*, February, July, August); indices of refraction, Quirke and Lacy (*ibid.*, November); feldspar twins, Emmons and Gates (*ibid.*, September); dichroism, Slawson and Thibault (*ibid.*, August).

Gem Minerals.—Eppler continued his studies on the ideal cutting of the diamond and other stones (*Zentralblatt fuer Mineralogie*, etc., No. 2, and *Neues Jahrbuch*, etc., No. 1). Bauer made a comprehensive study of certain zircons (*ibid.*, No. 2). Bergheimer (*ibid.*, No. 1) and Kraus and Slawson (*American Mineralogist*, November) discussed the variation of hardness in the diamond in relation to cutting and crystal structure. Leinz described the large President Vargas diamond, Minas Geraes, Brazil, weighing 726.6 karats (*Zentralblatt*, etc., No. 4). What is

reported to be the world's largest crystal of topaz, weighing 153lb., was secured by the United States National Museum, Washington. Other notable contributions were Ball's "The Diamond Industry" (*Jeweler's Circular-Keystone*, July), the enlarged third edition of Kraus and Slawson's *Gems and Gem Materials*, and Spencer's seventh series of biographical sketches of 30 mineralogists, recently deceased (*Mineralogical Magazine*, No. 165).

Necrology.—The toll of eminent mineralogists during 1939 was very heavy. G. Cesàro, 40 years professor of crystallography and mineralogy, University of Liège, Belgium, and twice president of the Belgian Academy of Sciences, died January 20, age 90. William Ebenezer Ford, member of the faculty of Yale university for 40 years and editor of various revisions of the Dana books on mineralogy, died March 23, age 61. William Arthur Tarr, for 28 years with the University of Missouri, author of *Introductory Economic Geology* and *Introduction to Geology*, died July 28, age 58. Alfred Harker, long associated with the University of Cambridge, England, author of widely used texts on minerals and rocks, died July 29, age 80. Edward Sydney Simpson, distinguished Australian mineral chemist, recipient of the W. B. Clarke and Kelvin medals of the Royal Societies of New South Wales and of Western Australia, respectively, died at South Perth, August 30, age 64. Waldeemar Lindgren, formerly of the Massachusetts Institute of Technology, author of *Mineral Deposits*, recipient of the Penrose medal of the Geological Society of America and the Wollaston medal of the Geological Society of London, died November 3, age 79. (See also MINERAL AND METAL PRICES AND PRODUCTION.)

Minnesota, a north central State of the United States popularly known as the "Gopher State," has an area of 84,682 sq.mi., of which 3,824 are water. Population, U.S. census of 1930, 2,563,953, estimated July 1, 1937, 2,652,000. Capital, St. Paul, 271,606. The only city in the State with a larger population was Minneapolis, 464,356. Duluth had 101,463. Of the State's population 1,257,616, or 49%, were urban. There were 2,538,973 whites, 9,445 coloured, 2,150,697 native-born and 388,294 foreign-born.

History.—Minnesota ranked comparatively low among the States in percentage of jobless as indicated by the 1937 unemployment census, with 98,495, or 3.8% of the population, unemployed. WPA spent \$52,000,000 in Minnesota in 1939, giving work to a monthly average of 51,788 persons, and PWA funds totalled \$16,151,386.

Two men were killed and 17 were injured in a WPA strike in July 1939. Ten thousand employees remained idle for several weeks, and loss in materials and wages amounted to \$500,000. Major labour disputes affected a farm implement machinery company, taxi drivers, elevator operators, a leather goods plant and a coke plant. The labour relations law went into effect on April 24; the labour conciliation board has been notified of more than 330 labour disputes, but in only a few instances have they reached the strike stage. "Only 2,185 were involved in strikes in 1939," according to Governor Harold E. Stassen.

The 1939 legislature convened on January 3 and adjourned on April 19, having spent 76 days in actual session. Fewer bills were introduced than at any session since 1931. Governor Stassen made

THE MOVEMENT OF CRYSTALS OF ATOMS is recorded in motion pictures as a strip of steel is stretched in a hydraulic tensile machine

an unusual record in that every proposal that he presented to the legislature in his inaugural message was enacted. Headlining the list is a sweeping reorganization act, which abolished three administrative boards and consolidated many others. A "good civil service law," the governor had declared, "will become the cornerstone of our administration." Under the act passed, a civil service department, headed by a board consisting of three members and the newly appointed director, Kenneth Pennybaker, had control of more than 12,000 State employees. The Labor Relations Act, one of the significant new laws enacted, stressed arbitration and conciliation. It was administered by a labour conciliator appointed by the governor. Other laws passed by the 1939 session were the Loan Shark Act and the Homestead Lien on old-age pensioners. The four-cent State gasoline tax was continued until Sept. 1940, and the royalty tax on iron ore was increased 1%, making a total tax of 9% on iron ore for 1939-40. The executive council, the State board of control, and the commissioner of administration and finance were replaced by the commissioner of administration, the social security department and a single tax commissioner. At the end of the year the governor said that the State debt had been cut down by more than \$5,000,000 and he reported economies in the cost of State government.

Education.—Minnesota school enrolment for 1938-39 was 349,761 pupils, 13,904 teachers; total public school expenditure, \$1,183,568. The University of Minnesota had a regular enrolment of 17,200 students in 1939, and a grand total of 37,810 students, including all branches and sessions. It ranked second in the U.S. in enrolment. Minnesota's educational system numbered 10 colleges in addition to the State university, 647 high schools, and six teachers' colleges.

Charities and Correction.—The State board of control and the State relief agency, abolished by legislative act in 1939, have been replaced by the Department of Social Security which is composed of three divisions, namely, public instructions, social welfare, and employment and security. Each division is headed by a director appointed by the governor for a four-year term. In 1939 it had general control over 19 State institutions and supervision of 14 county tuberculosis sanatoria. An average of \$20.71 per month was received by 66,377 old-age pensioners.

Banking and Finance.—On June 30, 1939, there were 677 banks (192 of them national) with deposits of \$699,960,505 and resources of \$781,744,686. Taxable valuation of real and personal property in the fiscal year ending June 30, 1938, was \$1,330,928,660. Moneys and credits for 1938 were \$684,747,539. The net State debt on June 30, 1939, was \$130,497,183.

Agriculture, Manufactures, Mineral Production.—In 1938 Minnesota had 175,143 farms, with a total area of 29,849,507 acres. The total value of all unplotted real estate in 1938 was \$1,488,297,528; the gross income from crops, \$85,181,000, and from livestock and livestock products, \$276,001,000. Measured by total gross farm income, Minnesota ranked 15th among the States. It led in production of butter, with 301,604,000 lb., in 1938; in barley, with 48,020,000 bu.; in flaxseed, with 4,756,000 bushels. It stood second in production of oats, with 128,700,000 bu., and fourth in corn, with 157,535,000 bushels.

The total 1938 payroll was \$514,109,086 with manufacturing accounting for 83% of that total. One of the important industrial activities in Minnesota is printing, which ranks third, with meat packing first and flour milling second. The mining output in 1938 amounted to 14,535,744 gross tons of iron ore and the value of mineral products, 1938, was \$44,361,534. This was a decrease of 70% from the record total in 1937.

nesota Historical Society (1922-30); T. C. Blegen, *Building Minnesota* (1938), and *Minnesota: Its History and Its People*, a syllabus, University of Minnesota Press (1937); *Minnesota: A State Guide*, Federal Writers' Project (1938). (T. C. B.)

Minnesota, University of. The university continues to increase on all enrolment bases and ranked second among American universities in regular collegiate enrolment for the 1938-39 fall quarter. The net total enrolment for the year which closed June 30, 1939, was 37,810, of whom 16,817 were women. The 1939 legislature provided funds for a Field Crops building on the farm campus. A dormitory for married graduate instructors was completed. Other buildings under construction include the \$2,000,000 Coffman Memorial Student Union, a women's dormitory, a journalism building, a museum of natural history, and a student health service building for the farm campus. The university in 1939 suffered heavy losses in the deaths of Dr. William J. Mayo, a member of the board of regents since Jan. 1907, and his brother, Dr. Charles H. Mayo, professor emeritus. In the fall of 1939 the medical and dental schools celebrated 50th anniversaries in connection with which scientific conferences were held. The university is one of nine schools carrying on graduate dental work with complete staffs and laboratory facilities. The deanship of the graduate school, vacant since the elevation of Dr. Guy Stanton Ford to the presidency, was filled by the appointment of Dr. Royal N. Chapman, formerly faculty member. A naval R.O.T.C. unit was authorized beginning with the academic year 1939-40 and participation in the experimental program of the Civil Aeronautics Authority which began in the spring of 1939 is being continued. Far-reaching programs for co-ordinating fine arts activities and student personnel activities were initiated. (G. S. F.)

Minorities. The Peace Treaties of Paris in 1919 reduced the number of national minorities under alien domination in Europe very considerably. The frontiers drawn corresponded more faithfully to the ethnical conditions of Central and Eastern Europe than the pre-war situation did. Many smaller nationalities received their independence. The new frontiers, however, left for historical, economic, and strategical reasons, large minority groups outside the countries where their co-nationals formed the majority of the population. The Peace Treaties established a system of protection for racial, linguistic and religious minorities through the League of Nations, so as to assure to the remaining minorities equality of treatment in the new states, where also newly introduced democratic constitutions proclaimed full civic rights for all inhabitants. The year 1939 witnessed the final collapse of this system of protection for the minorities in Central Europe. The breakdown of the League of Nations and the aggression of National Socialist Germany against Czecho-Slovakia and Poland completely destroyed the system built up at Versailles. Nationalities like the Czechs and the Poles which had in 1918 acquired their independence lost it and were subjected to a treatment the atrocity of which has no parallel in modern European history. All protection and all democratic guarantees for minorities were destroyed. Germany's aggression resulted in a situation for the minorities infinitely worse than that which had existed in the post-war years and definitely worse than that before 1914.

As a result of her dismemberment in 1938, Czecho-Slovakia at the beginning of 1939 contained only insignificant numbers of minorities. The German minority, although dispersed widely over the territory of the republic, claimed, however, a special status and the right of constituting itself as an almost independent state within the state and of exercising a decisive influence upon the political and cultural life of Czecho-Slovakia. Very soon it be-

THOMAS' CARTOON VERSION in *The Detroit News* of the old political adage that he who swallows minorities swallows poison.

came clear that the Czech claims had been fully justified according to which the Czechs could only exist economically and strategically by the inclusion of the Sudetenland and the maintenance of the historical frontiers of Bohemia and Moravia. In March 1939 Germany occupied Bohemia and Moravia, established her protectorate over the Czechs and subjected them to the rule of National Socialism. It now became evident that the German intention, in spite of solemn declarations made for propagandist purposes, had never been confined to uniting German minorities outside the Reich territory with the German Reich, but aimed at the domination over foreign nationalities which thus became subject minorities within the German Reich. Whereas the Peace Treaties in 1919 had incorporated over 3,000,000 Germans in Czechoslovakia, under the protection of the minority treaties of the League of Nations and with all the guarantees of equality and civil liberties embodied in a democratic constitution, the German destruction of the Peace Treaties subjected more than 7,000,000 Czechs, without any guarantees for their rights or liberties, to the National Socialist regime with its peculiar concepts of law, liberties and racial equality. The German aim at the incorporation of alien minorities was carried a step further by the conquest of Poland and the subjection of about 20,000,000 Poles. The German Government openly introduced in Poland its principles for the treatment of minorities. It proclaimed the racial inferiority of the Poles who therefore could not claim equal treatment with the German master race. They were to be completely eliminated from those parts which Germany wished to annex outright. In the other parts they were allowed to continue to exist as a helot race performing subordinate economic functions, but deprived of higher education, of the possibility of forming a leader class and of any opportunity for economic or social rise. Thus they should be prevented from ever again asserting their national aspirations or rights and should be transformed into a denationalized and subservient mass without any will to resistance. A similar fate was to fall upon the Czechs and other minorities within the orbit of Germany. The theory of racial inequality with all its consequences, first applied only to the Jews, was now applied to other nationalities as well.

A departure concerning minorities was inaugurated by Germany

in the fall of 1939 by the organized shift of German minorities from the Eastern European countries to Germany. The beginning was made with the German population in Italian South Tyrol. The Germans living there received the right of choosing between emigration to Germany or denationalization in Italy. This agreement was originally intended to remove the possible source of conflict, presented by the German problem in South Tyrol, between the two axis partners. After the conquest of Poland the Germans proclaimed the extension of the principle of the "repatriation" of the German minorities to all Eastern European countries. The German minorities in the Baltic countries, in the Soviet Union, in Hungary, in Rumania, and in Yugoslavia were ultimately to be "repatriated." Most of these minorities were no recent emigrants from Germany, but groups long established in their countries of residence, many of them living there for centuries, having taken firm root in the lands of their birth and contributed considerably to their economic and intellectual development. Now the "return" to the racial "fatherland" was demanded from them as a racial duty. So far the transfer of the German minorities in Latvia and Estonia has been carried out, in both cases with great speed and without much consideration for the traditional feelings and acquired interests of these minorities who had lived in the Baltic countries for many centuries. German minorities were also "repatriated" from the eastern parts of Poland which had been incorporated into the Soviet Union. All these German minorities brought into the Reich were to be settled in former Polish and Czech territories to help to hasten the process of Germanization.

Different was the situation in the parts of Poland incorporated into the Soviet Union in the fall of 1939. In this case no new minority problem was created. The population of the eastern provinces of Poland was ethnically and linguistically Ukrainian or White Russian, not Polish, and joined therefore the large Ukrainian and White Russian population living in the Ukrainian and White Russian republics which form part of the Soviet Union. In conformity with its principles of racial equality, the populations incorporated into the Soviet Union were treated on a footing of complete equality and cultural autonomy, and cannot therefore be regarded as minorities in the technical sense of the word.

As regards other minorities in Central and Eastern Europe, it may be briefly stated that the fate of the Jews deteriorated rapidly with the extension of National Socialist influence, and pressure for their emigration was intensified not only in Germany, but also in Hungary and Rumania (See *ANTI-SEMITISM; REFUGEES*). Especially deplorable was the situation of the Jews in the parts of Poland conquered by Germany. They were subject there to conditions of starvation and segregation intended to diminish their numbers rapidly. The rapprochement between Hungary and Yugoslavia led to an improvement of the position of the Hungarian minority in Yugoslavia which amounts to about 500,000. Rumania, whose considerable minorities in Transylvania, in Bessarabia, in Bukovina, and in the Dobruja, caused much anxiety to the Rumanian Government, tried to improve the situation of her minorities, especially of the 1,400,000 Hungarians in Transylvania. The minorities were invited to enter the Party of National Renaissance, the only existing political party in Rumania. A new cabinet post was created to deal specially with the interests and situation of the minorities. A new minority problem was created in Hungary by the annexation of Carpathian Ukraine or Ruthenia in March 1939. The newly annexed territory was granted a limited autonomy and the Ruthenian language was recognized as the second official language in the territory.

A great deterioration in the position of minorities occurred in Spain where the victory of General Franco abolished the autonomy gained by the Catalan and Basque minorities under the liberal regime of the Spanish republic. Not only were the regional auton-

omies abolished, but the use of the Catalan and Basque languages was strictly forbidden and these two minority peoples were subject to a ruthless policy of denationalization. In the Near East the situation of the ethnical and religious minorities did not evoke any special complaint during 1939. The situation in Palestine cannot be treated in this connection, as the dissatisfaction in Palestine which led to the long-lasting unrest and revolts did not emanate primarily from the Jewish minority, but from the Arab majority (see PALESTINE). In Syria the existence of minority demands served as a pretext for the French Government to abrogate the existing constitution and to introduce a decentralization of the administration in disregard of the wishes of the large majority of the population. In British India the tension between the Hindu majority and the Mohammedan minority did not abate and was regarded by the British Government as the principal obstacle for the granting of immediate dominion status to India. In Canada the French minority showed its loyalty to the dominion and to the Empire on the occasion of the outbreak of the European war, and elections held in Quebec in Oct. 1939 confirmed this trend. (For fuller figures on Jews, see JEWISH RACE, DISTRIBUTION OF.)

Mississippi, admitted as a State in 1817; popularly known as the "Bayou State"; area, 46,810 sq.mi.; population (U.S. census, 1930), 2,009,821; (estimate July 1, 1937), 2,023,000. Capital, Jackson, 63,000, largest city in the State. Of the State's population in 1930, 340,964 were urban, or 16.9%; 1,000,103 whites; 1,009,718 coloured; 1,999,429 native born; 7,145 foreign born.

History.—The State of Mississippi votes solidly the Democratic ticket. For the period 1940-44 the principal officers of the State are: governor, Paul B. Johnson; lieutenant-governor, Dennis Murphree; secretary of State, Walker Wood; attorney-general, Greek L. Rice; State tax collector, Carl N. Craig; State treasurer, Lewis S. May; superintendent of education, J. S. Vandiver; presiding officer of the State senate, lieutenant-governor, Dennis Murphree; presiding officer of the house of representatives of the State, Sam E. Lumpkin. The State senate has 49 members in addition to the presiding officer, the lieutenant-governor. The house of representatives has 140 members. In the membership of the State legislature farmers predominate with a total of 67 in the two houses; lawyers, 59; teachers, 23; merchants, 9; insurance agents, 5; with 13 other occupations represented in the membership with from five to one member. All members of the legislature are members of the Democratic Party.

Education.—The State maintains two systems of public schools, one for whites and one for Negroes, as required by the

constitution. Consolidation of rural schools has been very extensive in the past decade, the rural schools of all 82 counties of the State having been to some extent consolidated.

Banking.—There are in the State 181 State banks, including 22 branch banks, and 24 national banks, including one branch bank. Bank resources stood at \$220,049,522 on June 30, 1939, with deposits at \$191,830,992.

Agriculture and Manufactures.—Agriculture provided direct employment for 66.8% of the State's total population. Sixty-six per cent of the total land area of the State is used for agricultural purposes, there being 311,683 farms covering 19,655,413 ac. in 1935, with a crop output of \$114,327,000, of which \$89,883,000 was cotton and \$14,797,000 was cottonseed.

Manufacturing in recent years has developed very rapidly, particularly manufacturing having to do with the use of cotton and the use of wood products. (A. B. Bu.)

Missouri, second State carved from the Louisiana Purchase, admitted to the Union in 1821, popularly known as the "Show Me" State; area, 69,420 sq.mi.; population according to the U.S. census of 1930, 3,629,367, estimated July 1, 1937, 3,989,000. Capital, Jefferson City, 21,596. The four largest cities (1930) were: St. Louis, 821,960; Kansas City, 399,746; St. Joseph, 80,935; Springfield, 57,527. Of the State's population (1930) 1,859,119 were urban, or 51.2%; 3,398,887 whites; 230,480 coloured; 3,476,934 native born, or 95.8%; 152,433 foreign born. Principal State officers (1940): governor, Lloyd C. Stark (Democrat); lieutenant-governor, Frank G. Harris; secretary of State, Dwight H. Brown; auditor, Forrest Smith; treasurer, R. W. Winn; attorney-general, Roy S. McKittrick.

History.—The outstanding event of 1939 was the crippling of the powerful Pendergast political machine (Democrat), previously weakened by Federal convictions growing out of the 1936 election frauds. Governor Stark's appeals to President Roosevelt instigated action by the U.S. Treasury and Justice departments, which, following U.S. District Attorney Milligan's efficient prosecutions for income tax evasion, resulted in the imprisonment at Leavenworth of boss Thomas J. Pendergast and four of his henchmen. The State then broke the machine's control over the Kansas City police, and also helped Federal authorities to destroy the machine's influence in the WPA in Missouri. The 60th session of the Missouri General Assembly (Jan. 4-June 24, 1939) remained in session longer than any previous assembly. Voting about \$232,000,000 for various purposes, it appropriated more money than any assembly in the State's history. Its appropriation for general relief was \$6,500,000 (previous biennium \$9,000,000). Among the more important laws enacted were: placing the Kansas City police department under control of a board consisting of the mayor and of four commissioners appointed by the governor; making need the determining factor in granting old-age assistance; lowering old-age assistance eligibility from 70 years to 65 after Dec. 31, 1939; extending the 2% sales tax until Dec. 31, 1941; directing Lincoln university to provide Missouri Negroes "opportunity for training up to the standard furnished" by the University of Missouri.

Education.—For the school year ending June 30, 1939 the public school system consisted of the University of Missouri, Missouri School of Mines and Metallurgy, five State teachers colleges, Lincoln university (Negro), schools for the deaf and blind, Negro Vocational school, approximately 10,000 elementary schools, and 956 high schools. For the same period there were 519,830 pupils and 18,466 teachers in elementary schools, and 192,496 pupils and 7,876 teachers in high schools; total disbursements of the school districts were \$57,875,789.

Charities.—In Dec. 1938 the combined amount of public relief

PAUL B. JOHNSON, elected governor of Mississippi Nov. 7, 1939

expenditures (public assistance, WPA, etc.) was \$7,296,842, an all-time monthly peak, which declined during 1939. In Nov. 1939 old-age assistance for persons 70 or over averaged \$18.94. The unemployment compensation payments for 1939 totalled \$5,464,683. During the same year the Missouri State Employment Service placed 67,022 in private industry (120.5% over 1938) and 13,650 in public employment. The Trachoma hospital at Rolla, completed in 1939, is the only State hospital in the U.S. for the exclusive treatment of trachoma, a principal cause of blindness. The Ellis Fischel State Cancer hospital is (Jan. 1940) near completion at Columbia; it will be the first State cancer hospital in the U.S.

Finance.—The balance in the State treasury on Dec. 31, 1937 was \$24,706,385.44; receipts for 1938, \$88,387,044.20; disbursements 1938, \$91,867,408.54; balance in State treasury Dec. 31, 1938, \$21,226,021.10. The total bonded State indebtedness on Dec. 31, 1938 was \$109,943,000; on Dec. 31, 1939, \$103,255,000.

Agriculture, Manufactures, Mineral Production.—In 1937 Missouri had 202,863 farms with a total acreage of 35,238,370, of which 13,221,740 ac. were devoted to crops and 15,723,000 to pasture. For the same year it ranked fifth among the States in number of hogs on farms, eighth in horses and cattle, ninth in mules, and 11th in sheep; for 1938, seventh in quantity of corn, oats, and grain sorghums produced, eighth in winter wheat, and 11th in tame hay.

In 1935 Missouri ranked tenth among the States in manufacturing on the basis of number of establishments, 11th in value of products, 13th in number of wage-earners, and 12th in amount of wages.

The value of the State's mineral products for 1937 was \$52,446,272. In the same year Missouri's place among the States was first in value of lead and barite produced, second in chats, and third in lime and raw clay. During 1938 Missouri produced 122,027 tons of lead, which was 33.4% of the total output in the U.S. and 6.5% of the world's production. (R. P. Br.)

Mohammedanism: *see* ISLAM.

Molotov, Vyacheslav Mikhailovich

(1890—), Russian statesman, was educated at Petersburg Polytechnic and during his youth organized Bolshevik student groups and worked for the newspaper *Pravda*. February of 1917 found him a member of the Petrograd Soviet executive committee. He also served on the military-revolutionary committee of the Soviets and during the next two years held party posts at Petrograd and Nijni-Novgorod. In 1920 he was appointed secretary of the central committee of the Communist Party of the Ukraine, and in the following year he held this office for the whole of the U.S.S.R. After occupying high offices in the Russian Politbureau and Comintern he was appointed in 1930 president of the Soviet of People's Commissars. He continued to hold the office of premier when, on May 3, 1939, it was announced that he would succeed Maxim Litvinov as foreign commissar. This appointment foreshadowed a radical shift in Soviet foreign policy, but few were prepared to prophesy that it would culminate in the Nazi-Soviet pact of non-aggression that surprised the world in August. Sitting at the side of Stalin and German Foreign Minister von Ribbentrop, Molotov signed the pact early August 24 at Moscow. At the session of the Supreme Soviet which ratified the treaty seven days later, Molotov explained that Russia had decided not to enter a military alliance with Great Britain and France because, among other reasons, the British had backed up Poland's refusal to allow Soviet troops on Polish soil. A period of furious diplomatic activity for Molotov followed the outbreak of war. (*See* UNION OF SOVIET SOCIALIST REPUBLICS.)

Molybdenum. The United States is the foremost producer of molybdenum, with about 86% of the world's recorded production to date, and a current output of about 92% of the total. Australia, Chosen, Japan, Spain, and Sweden have contributed in the past, but are no longer active; Norway has long been a producer, but contributes only 3% of the current output, while Mexico, which first produced in 1932, now supplies 3%; Morocco, beginning in 1933, now adds another 1%, and various smaller producers the same amount, making a total of 16,337 metric tons in 1938 against 14,250 tons in 1937. An output of 2,200 tons in 1929 declined to 1,280 tons in 1932, but new developments in the applications of molybdenum in alloy steels and cast iron have resulted in a demand which has increased the 1932 low by nearly thirteenfold in six years. (G. A. Ro.)

Monaco. A principality on the Mediterranean coast, bounded on the land side by French territory. Area 375 ac. (0.59 sq.mi.); pop. (est. 1938), 22,994. Chief towns: Monaco, La Condamine, Monte Carlo; ruler: Prince Louis II; language: French. The chief occupation is catering for visitors, who number more than 2,000,000 annually, and the revenue is wholly provided by the Casino.

Monazite. Formerly in demand as a source of thorium for incandescent gas mantles, monazite declined in output as electric lighting supplanted gas, and for a time production almost ceased. Later, demand was renewed, to furnish cerium for pyrophoric alloys, and recently has been increased by the use of thorium in radio tubes. The bulk of the world output comes from Travancore, in India, 5,220 long tons being reported for 1938. Brazil was formerly the leading producer, but dropped from the market when Travancore began to increase heavily; Brazilian shipments were revived in 1937, with 424 metric tons. Netherlands East Indies, a new producer, supplied 668 metric tons in 1937 and 370 tons in 1938. United States imports vary widely from year to year, averaging about 600 short tons. (G. A. Ro.)

Mondell, Frank Wheeler (1860–1939), U.S. legislator, was born at St. Louis on November 6 and was educated in public schools and by private tutors. In 1887 he moved to Wyoming to prospect for coal and later became manager of a mine there. He was mayor of Newcastle, Wyo. from 1888 to 1895, president of the senate in 1892, and assistant commissioner of the General Land office from 1897 to 1899. He was first elected to the U.S. House of Representatives in 1895. Elected again on the Republican ballot in 1899 he was a member of the 56th to 67th Congresses inclusive (1899–1923) and was majority floor leader of the 66th and 67th. Mondell was the author of *My Story*. He died August 6 at Washington, D. C.

Monetary Units of Leading Countries: *see* EXCHANGE RATES.

Mongolia (INNER AND OUTER), is a vast sparsely populated tableland occupying about 1,000,000 sq.mi. in North-eastern Asia. It is bounded on the north by Siberia, on the west by Chinese Turkestan, on the east by Manchoukuo, on the south by China Proper. Of the two component parts of Mongolia, Outer Mongolia (622,744 sq.mi.) is greater in extent; but Inner Mongolia (334,100 sq.mi.), understanding by that term the three Chinese provinces of Chahar, Suiyuan and Ningsia, is more thickly populated. The population of Outer Mongolia is usually estimated at 750,000–800,000, while there are about 1,500,000 Mongols in Inner Mongolia. Mongols constitute the majority of the population in those provinces of Manchoukuo which lie west of the

Hsingan mountains and in the Soviet Republic of Buriat-Mongolia and some of them are to be found in Chinese Turkestan. They are mostly a nomadic and pastoral people, although in regions where they have mixed with the Chinese they show some tendency to adopt a settled agricultural life. Their unit of social organization is the tribe, or banner.

Lamaism, a somewhat corrupted form of Buddhism, is the dominant religion; and Lamas, or priests, constitute a considerable part of the population.

History: Inner Mongolia.—A feature of life in Inner Mongolia has been the rapid development of Chinese colonization, especially along the line of the Peiping-Suiyuan railway. This led to much friction between the Chinese agriculturists, who wished to settle on the land, and the nomadic Mongols, who desired to keep large open spaces for the pasturing of their flocks and herds. There were occasional Mongol riots and revolts; but the Chinese officials, on the whole, maintained the upper hand until a new factor entered into the situation as a result of the creation of Manchoukuo. Japanese military influence began to spread from Manchoukuo into Inner Mongolia and the Japanese took advantage of the antagonism between the Mongols and the Chinese.

A so-called Mongolian Autonomous Political Council, with headquarters in Pailingmiao, came into existence under the leadership of Prince Teh, a Chahar Mongol. Prince Teh's policy was to hold the balance between Japan and China, endeavouring to obtain the maximum degree of Mongolian autonomy; but his hand was largely forced by the sweeping Japanese advance into North China in the summer of 1937. The Japanese had already obtained an adherent in Li Shou-hsin, a Manchoukuo Mongol who commanded an irregular force which had taken over several counties of Chahar in the winter of 1935-36. Mongol cavalry co-operated with the Japanese in their advance to Paotow, railhead of the Peiping-Suiyuan railway. At the end of Oct. 1937 an Autonomous Government of Mongolia was formed, headed by Prince Yun, a leader of the Suiyuan Mongols, with Prince Teh as vice-chief of State. The territory of the new State provisionally includes Suiyuan, and the northern part of Chahar. It is provided with Japanese military and political advisers. After the death of Prince Yun, in April 1938, Prince Teh became head of the Inner Mongolian Government. Because of racial, economic, and geographical conditions two other autonomous regimes, loosely linked up with the Inner Mongolia regime, have been set up, with headquarters at Tatung, in North Shansi, and at Kalgan, in South Chahar.

History: Outer Mongolia.—The Republic of Outer Mongolia came into existence as a result of the invasion of this region by Soviet troops waging war against the White leader, Baron Ungern-Sternberg, who had made Outer Mongolia a base of operations. With this Soviet aid a group of Mongolian revolutionaries established themselves in power; and since 1921, when the so-called People's Revolutionary Government was established in Urga (now renamed Ulan Bator), the capital of Outer Mongolia, that territory has been in very close relations with the Soviet Union.

The Government of Outer Mongolia endeavoured to push through a regime of agricultural collectivization on Russian models, and this led to much discontent and several revolts between 1929 and 1932. Subsequently this effort was considerably modified and internal conditions in the country during recent years seem to have been more settled. There has been sporadic border fighting with Japanese and Manchoukuo troops in the Lake Buir region, along the eastern frontier of Outer Mongolia. While the country is still overwhelmingly pastoral in character there has been a slight development of coal mines not far from the capital, Ulan Bator, and a small railway was built to facilitate development of these mines, while a highway was constructed between Ulan Bator and the Soviet frontier town of Kiakhta.

Montana, a Northwestern State of the United States admitted Nov. 8, 1889, popularly known as the "Treasure State"; area 146,572 sq.mi. (third largest in the Union); population according to the U.S. census of 1930, 537,606, estimated by the Census Bureau July 1, 1937, 539,000. Capital, Helena, 11,803, which is the fifth city in size in the State. Larger cities (with their 1930 population) are: Butte, 39,532; Great Falls, 28,822; Billings, 16,380 and Missoula, 14,657. Of the State's population in 1930, about 33% or 181,036 were urban; 517,327 were whites of whom 444,366 were native born; 14,798 were Indians. According to the Indian Service there were 16,341 Indians in Montana in 1938. There were 216,479 gainful workers in 1930. Of these 79,518 were engaged in agriculture, 14,952 in mining, and 33,618 in manufacturing.

History.—Politics centre on redistribution of tax burdens, improved working conditions, water conservation and irrigation, and extension of social security. Farm and labour groups control the legislature. Roy E. Ayers was elected governor in 1936, Sam Mitchell, secretary of State, Harrison Freeborne, attorney-general, and Ray N. Shannon, treasurer. In 1938, Jerry J. O'Connell, liberal Democrat, was defeated for re-election to Congress.

Education.—The public schools, with a budget of \$13,000,000 enrol 77,000 pupils in the grades and 33,000 in high schools. The six units of the University of Montana register 5,227 students and have an income of \$1,666,969.

Charities and Correction.—Charities and relief were administered almost entirely by the State Board of Public Welfare and by Federal agencies. The State maintains institutions for orphans, blind, deaf, dumb, insane and tuberculars. It also has reform schools for boys and girls, and a State penitentiary.

Finance.—The public debt of the State amounts to \$11,699,000. The State now operates on a balanced budget with an income in 1939 of \$33,669,000, including \$2,734,000 payroll tax. Net county indebtedness is \$6,973,000. The tax income of the 56 counties is \$9,340,000, mostly from property taxes. City and town indebtedness is \$4,987,000, and their tax income is \$4,000,000. School districts have a net indebtedness of \$8,511,000, and an annual tax income of \$9,600,000. Total tax delinquency in 1939 was \$17,722,000.

Agriculture, Manufactures, Mineral Production.—The State contains 47,400,000 ac. of agricultural and grazing lands (excluding public lands), valued at \$379,000,000. The chief crop is wheat, of which 56,608,000 bu. were raised in 1939. Also produced were 891,000 tons of sugar beets, 2,451,000 tons of hay and 320,000 bu. of apples. Sugar and cereals are important manufactures. On the ranches are 1,016,000 cattle, 3,210,000 sheep and 253,000 horses. The forests contain 50,000,000,000 hd.ft. of standing timber located on 14,613,000 acres. From these, 245,000,000 hd.ft. were cut in 1939. Metal production is valued around \$60,000,000 annually, petroleum at \$15,000,000, and coal at \$4,000,000. Copper is the most valuable metal product, but gold, silver and zinc are important. Smelters at Anaconda, Great Falls and East Helena treat the ore and there are mills for making copper wire and other finished products. Electrical energy amounting annually to 1,500,000,000 kw.hr. furnishes power for factories and railroads.

Montreal, in the Province of Quebec, Canada, is situated on an island at the confluence of the Ottawa and St. Lawrence rivers, approximately 1,000 mi. from the Atlantic ocean and 2,760 mi. from Liverpool. It is at the head of ocean navigation and the terminus of lake vessels. It is served by three canal systems, the St. Lawrence canals, 1,230 mi. to the Great Lakes, the Eastern United States canals, via the Richelieu river and Lake Champlain, 127 mi., and the Ottawa river canals, 119 miles. The head offices of the Canadian Pacific railway and of the Canadian National railways are situated at Montreal.

Population of the city of Montreal (Federal census, 1931), 810,925, and of greater Montreal, including its suburbs, 973,637. In 1939, as estimated by Lovell's *Directory*, the population was: city of Montreal 1,286,388, greater Montreal 1,471,928. Greater Montreal is governed by a Metropolitan commission, the majority of whose members are appointed by the city council of Montreal. The city council consists of 35 aldermen, of whom 5, selected by the council, comprise the executive committee. The mayor, elected by the city, is not a member of the executive committee.

Control of education is divided between the Catholic School Commission of Montreal and the Montreal Protestant Central School Board. The method of appointing members of the Catholic School Commission of Montreal was modified during 1937. The commission appointed in 1938 to examine and report on the Protestant school situation suggested modifications in the method of appointing members to the Montreal Protestant Central School Board and advised some changes in the curriculum. It also drew attention to the financial aspect of the problem.

The port of Montreal is the largest in Canada. The number of sea-going vessel arrivals in 1939 was 945, having a tonnage of 3,678,281. The number of coastal or inland vessel arrivals in 1939 was 431, having a tonnage of 937,991. The total inward cargo tonnage for 1939 was 9,410,958 and the total outward cargo tonnage 5,388,735. For 1939 the amount of building permits issued stood at (new) 1,151, value \$7,071,161, (repairs) 1,830, value \$2,182,345; bank deposits (for 11 months ended Nov. 30, 1939) \$28,560,485,250, and bank clearings (for 12 months ended Dec. 31, 1939) \$17,125,877,672. The assessed value of real estate was \$1,236,537,229. (J. A. MA.)

Moore, Hugh Kelsea (1872-1939), U.S. chemical engineer, was born January 3 at Andover, Mass. and was educated at Massachusetts Institute of Technology. Among his inventions were a ten-effect multiple effect evaporator, the unsubmerged diaphragm cell, a stationary furnace for recovering soda content from black liquor, and new processes for making calcium arsenate and converting sodium sulphate into caustic soda and other chemicals. He also conducted research in refrigeration, pulp manufacture, hydrogenating oil, and many other related fields. In 1920 he was awarded the gold medal of the American Institute of Chemical Engineers for the "best contributions to applied science since 1913." He was also awarded the Perkin medal in 1925. Moore, who retired from business in 1934, died at Dunedin, Fla., December 18.

Moravia: see BOHEMIA AND MORAVIA.

Mormons (or LATTER DAY SAINTS). During 1939 the church continued to press forward in its welfare work under the plan adopted in April 1936. It has made more effective its productive budgetary plan, under which a survey is first made of the needs of the various ecclesiastical administrative units

as to food, clothing, shelter, and fuel, and then an assignment is made to these various units of the materials which they are expected to produce for the church budget. At the end of the season there is a supervised interchange and exchange of these materials so that the needs of each community are as fully met as possible. For example, grapefruit, oranges, and lemons from Arizona may be exchanged for Idaho potatoes. Coal from eastern Utah coal mines may be exchanged for flour and canned goods from northern Utah. To facilitate this exchange the materials produced are gathered into storehouses, of which there are more than 70 in the church. Each storehouse arranges for the interchange of products in adjacent areas. A central storehouse in Salt Lake City effects exchanges among the different storehouses. A General Church Committee supervises these exchanges.

In the main such materials are produced by voluntary, unpaid labour. The entire male membership of the church over 12 years of age bear the priesthood—there being no ministerial or priestly class in the church. This priesthood is divided into a higher (Melchizedek) and a lower (Aaronic) priesthood, and each of these is subdivided into other groups, which are again divided into sub-groups called quorums. These quorums are the ultimate units involved in the production of materials. (J. R. CL.)

Morocco: see FRENCH COLONIAL EMPIRE.

Moscicki, Ignacy (1867-), Polish statesman and scientist, was educated at Riga Polytechnic, where he earned a reputation as a brilliant student of chemistry and electricity. He became a lecturer at Freiburg university in 1897 and was appointed professor of electrochemistry at Lwow Polytechnic in 1912. Among his many discoveries, those made in connection with the oxygenization of nitrogen were his most notable. Moscicki organized the Polish Chemical Research institute and was for a while director of a nitrate compounds factory. Although he was interested in politics he had never held even a minor political post when, as Pilsudski's nominee, he was elected president of Poland in May 1926. Moscicki did not take an active part in the "war of words" which preceded the German invasion of Poland in 1939, except that on August 25, replying to President Roosevelt's joint appeal to Hitler and himself, he declared Poland's willingness to attempt a settlement of its dispute with Germany by direct negotiation, arbitration, or conciliation. Fleeing with his ministers before the rapid German advance, Moscicki crossed the Rumanian border and arrived at Cernauti on September 18 after proclaiming that the Polish Government would continue to function with full authority on foreign soil. Twelve days later he resigned in favour of Wladislaw Raczewicz, who established his Government in Paris. Moscicki left Rumania December 26 for Switzerland to enter a sanatorium.

Motion Pictures. The motion picture industry, the invention of Edison, enters its 51st year in 1940 with the greatest economy program ever planned in this lavish business. Labour battles, the European war losses, the annihilation of Japanese and Chinese markets put a drastic economy program into effect.

The investment of \$2,000,000,000, as chronicled in 1938, remains the same, and is distributed in this manner:

Theatres	\$1,880,000,000
Studios	100,000,000
Distribution	20,000,000
	<hr/> \$2,000,000,000

Upper left: CLARK GABLE AND VIVIEN LEIGH in *Gone with the Wind*. The premiere in Atlanta, Ga., Dec. 15, 1939, was an event of national importance. Miss Leigh's acting in this picture won her the 1939 Academy Award

Upper right: NO MEN APPEARED in the cast of *The Women*

Centre left: HENRY FONDA as Lincoln in *Young Mr. Lincoln*

Centre right: SCENE from *Andy Hardy Gets Spring Fever*, released in 1939 as one of a series starring Mickey Rooney (centre)

Above: ROBERT DONAT (right) and Greer Garson in *Good-bye, Mr. Chips*. For this part Mr. Donat received the 1939 Academy Award

Below: JEAN ARTHUR, JAMES STEWART, and Thomas Mitchell in *Mr. Smith Goes to Washington*

Lower right: A NOTABLE TECHNICOLOR PRODUCTION of 1939 was *The Wizard of Oz*

The number regularly employed in the industry in the United States at the end of 1938 was 282,000, and the annual payroll was \$368,560,000. These figures have been greatly reduced during 1939 because of economic necessities due to existing war conditions. Although no definite figures are yet available it is estimated that the losses will not amount to one-third of the revenue, as was at first feared. However, because of the loss of foreign markets each studio has reduced its payroll to meet the lowered income.

With only 31 years of existence in California, this industry has attained world-wide scope. No other business institution boasts such extraordinary growth in one generation. In its influence on human lives it overshadows even its amazing financial triumphs and is seen to take on, more and more, the characteristics of an international service. It mirrors and tends to shape world-wide political developments in an era of strange and tragic tensions.

It has been a most effective instrument for showing world-wide affairs through the newsreels, which took on a new importance in 1939. The Nazi march into Poland, the "Blitzkrieg" of Hitler's armed legions against the outnumbered Poles, the Soviet invasion of Finland, and the preparation of both France and England, as these two nations again declared war against Germany, were among the newsreel subjects of 1939.

These celluloid newspapers also recorded, accurately and entertainingly, the visit of King George VI and Queen Elizabeth to the United States.

As an indication of the good-will influence of motion pictures it is to be recorded that 85,000,000 view the cinema weekly in America, and although the figures, it was first believed, would show a reduction due to the various wars, and only 50,000,000 instead of 150,000,000 others see motion pictures beyond the boundaries of the U.S., it is now estimated that the loss will not be as great as first anticipated.

The top place, accorded the most popular screen player, formerly was occupied by Shirley Temple, an American child of 10, for four years. This position was given in 1939 to Mickey Rooney, a boy of 18. Mickey, in that year, made the most spectacular rise to fame of any motion picture actor.

According to the annual survey of the *Motion Picture Herald*, a trade publication which claims to poll the theatre owners of the United States, Mickey Rooney is named first in popularity at the box office. He is followed in the order named by Tyrone Power, Spencer Tracy, Clark Gable, Shirley Temple, Bette Davis, Alice Faye, Errol Flynn, James Cagney and Sonja Henie.

The most expensive and most widely discussed picture, *Gone With the Wind*, was completed at a cost of \$4,000,000. Statisticians claim it not only will return that amount of money, but make at least \$8,000,000 profit. These figures are based on the early returns of this dramatization of Margaret Mitchell's widely read novel. Vivien Leigh, an English actress, was given an award for the best performance of the year by the New York film critics. Her portrayal of Scarlett O'Hara in *Gone With the Wind* was singled out for this honour. James Stewart was selected by these critics for the outstanding male performance of the year in *Mr. Smith Goes to Washington*.

An adaptation of Emily Brontë's novel, *Wuthering Heights*, produced by Samuel Goldwyn, was chosen by the critics as the best picture of the year. John Ford's direction of *Stagecoach* was awarded first honours.

It is significant that the trend of motion pictures for 1939 was toward American subjects and in glorifying great Americans who have contributed to the sciences and political security of the U.S. Biographies have included *The Life of Alexander Graham Bell* and *Young Mr. Lincoln*, and an ambitious life story of Thomas A. Edison has been planned by Metro-Goldwyn-Mayer.

Gangster, prison, and G-men dramas have kept up their aver-

age. The family series, so popular in 1938, are still leading attractions. The year 1939 saw more remakes of famous plays and pictures than any previous year.

Just as the movies have shown their appreciation of America's great men during 1939, so have they given young America its golden opportunity on the motion picture screen. Many of the outstanding successes were achieved by young people not yet 21.

Before the advent of the European war the Hollywood film studios had mapped out an expansion program with the largest planned expenditure in improvements in the history of motion pictures. More than \$6,000,000 were spent on new constructions, equipment and repairs. Walt Disney commenced work on a new studio in San Fernando valley, California, which will represent an investment of more than \$1,500,000.

The supremacy of the United States in film production remained unchallenged, and the technical skill and entertainment factors developed during the year attained an excellence hitherto unsurpassed. Yet, from a financial standpoint, 1939 was not one of the industry's most profitable years. This condition was attributed, by most informed quarters, to foreign restrictions, quotas, and prohibitive taxes on American films by foreign Governments, particularly the totalitarian States.

The totalitarian States zealously employ imposts, quotas, and provide governmental subsidies to check the importation of foreign films. It is the apparent theory that to shut out alien ideas promotes the acceptance of nationalistic opinions. And because those who live under dictatorships are subtly influenced by the appeal to human emotions—the joys, sorrows, and ambitions that make the whole world kin—the ruling powers fear American films.

The \$2,000,000,000 motion picture industry in the United States for 1939 had an output of 530 feature pictures and 718 short subjects, with an approximate expenditure of \$170,000,000 on production, stories, and talent. The industry has always been forced to rely on sheer entertainment value and artistic merit to maintain its recognized 75% of the world's "screen time." This is because the United States imposes no discriminatory regulations on film imports except a normal tariff rate equal for all.

While the war slowed up the European film production, before the outbreak of hostilities both France and England produced some noteworthy films.

The American companies, at the beginning of 1939, had extensive plans for London productions. One of the finest pictures of the year, *Goodbye, Mr. Chips*, was made in England by Metro-Goldwyn-Mayer, and Robert Donat, the British star, was praised for his fine performance as the school master. Production was greatly cut down for many months but at the close of 1939 conditions were considerably brighter. Noteworthy films produced in England during 1939 were *U-Boat 29*, *The Beachcomber*, *The Challenge*, *The Mikado*, *Edge of the World*, *Four Feathers*, *Jamaica Inn*.

The war brought to an end, temporarily at least, France's most successful year in motion picture production. There was a steady growth in output and excellence of product in spite of heavier taxation, more severe legislation, higher costs and the imminence of war. The general excellence of the French product, both from the standpoint of artistic direction and originality of theme, was exemplified in *Harvest*, *End of a Day*, *Champs Elysees*, *The Puritan* and *Port of Shadows*.

Italian film production lagged behind, in spite of the efforts of the Government-subsidized industry to interest American producers in coming to the film centre, Citta del Cinema. Mussolini announced that 30 American films will be sufficient for the Italian market and states that good American pictures "if maintained in such numbers will not be dangerous for Italian production." Germany and Soviet Russia continued to control motion picture

production virtually 100%, so that most of the films of these nations were nationalistic propaganda.

The cinema industry has maintained in the United States an independence of governmental control that has been the envy of foreign motion picture producers. It has kept itself comparatively free from criticism by self-discipline and control. This autonomy has been attained only after open threats of boycott by moral groups and by censorship in a few States and cities.

Under the direction of Will H. Hays, for 16 years head of the Motion Picture Producers and Distributors of America, Inc., the principal producers have submitted to a voluntary censorship. The most serious criticism of this idealistic scheme is that it sometimes sacrifices artistic integrity to the considerations of security at the box office—but always in the name of public morality.

Since 1937, however, Mr. Hays, who is also an attorney, has been occupied with a more serious task. This is the organization of the defence of the leaders of the industry against a suit to separate the producing interests from those of the distributors. This suit is an action in equity filed by the United States Attorney General in Federal Court at New York. It was brought under the Sherman anti-trust act and alleges the defendants are guilty of forming an illegal monopoly. It is announced that the Department of Justice believed the suit was necessary to restore competitive conditions in the industry.

To this suit, Hays replied with a statement that the motion picture producers and distributors would welcome the prospect of a fair and conclusive endeavour to clarify the application of the existing laws to the trade customs inherent in the development of the motion picture industry. He pointed out that the relationship between producers and consumers of motion picture entertainment is better today than ever before, adding the hope that "judicial clarification would dispel the fog of uncertainty regarding some customs that have grown up in the distribution of a film product involving 12,000,000 transactions every year."

The year 1939 was the most turbulent in the history of motion pictures so far as labour troubles were concerned. Strike threats, hearings before the National Labor Relations Board and intra-union fights, involved long and expensive litigation. A jurisdictional fight between the Screen Actors' Guild and the International Alliance of Theatrical Stage Employees, with the Screen Actors' Guild winning, was one of the significant battles of the year.

Another controversy was that of the United Studio Technicians Guild who fought to control 5,000 IATSE employees, but was defeated. There was a revival of demands for recognition by the Screen Writers' Guild under their own terms. A strike, involving all the A.F. of L. employees in the studios, and the projectionists throughout the United States, was averted at the last moment, by the granting of a 10% salary increase. A promise was made that negotiations could be reopened in Feb. 1940.

In 1939 the studios spent \$1,739,000 for motion picture scripts. Of this amount 22 books were purchased at a total cost of \$728,000 and 18 plays at \$1,011,000, with future royalties still to be computed. While the producers in 1939 did not neglect the time-tested formulae that usually spell success, they did keep away, largely, from costume pictures and musicals. *Broadway Melody*, *Babes in Arms* and *The Great Victor Herbert* were the few successful musical films and their success points toward the production of a greater number during 1940. *If I Were King*, *The Private Lives of Elizabeth and Essex*, and *Juarez* topped the meagre list of costume productions.

With *Gulliver's Travels*, *The Wizard of Oz*, already released, and *The Blue Bird*, *Pinocchio* and 1,000,000 B.C., *Dr. Cyclops*, and a prehistoric story planned for 1940, fantasy will play an important part in the 1940 output of motion pictures.

Among the most important films of 1939 are *Stanley and Livingstone*, *Gone With the Wind*, *Mr. Smith Goes to Washington*, *Stagecoach*, *Wuthering Heights*, *Dark Victory*, *The Old Maid*, *Juarez*, *Goodbye, Mr. Chips*, *The Rains Came*, *Bachelor Mother*, *Ninotchka*, *Love Affair*, *The Women*, *Each Dawn I Die*, *Drums Along the Mohawk*, *Gunga Din*, *Nurse Edith Cavell*, *Rose of Washington Square*, *Wizard of Oz*, *Young Mr. Lincoln*, and *Life of Alexander Graham Bell*.

Notable, also, was the increased amount of Technicolor productions due to the decided advancement in speed emulsions, economies in lighting, improved processing and a better acquaintance with the necessities of camera, laboratory, and colour.

The awards by the Academy of Motion Picture Arts and Sciences for 1938, were made in March 1939, as follows: Bette Davis, best actress of the year, for her screen performance in *Jezebel*; Spencer Tracy, best actor, for his performance in *Boys' Town*; Walter Brennan, best supporting actor in *Kentucky*; Fay Bainter, best supporting actress, in *Jezebel*; Frank Capra for direction of *You Can't Take It With You*; special awards to Walt Disney for *Ferdinand the Bull* and *Snow White*; special awards to Deanna Durbin and Mickey Rooney for outstanding juvenile performances; award for best screen play and dialogue to George Bernard Shaw for *Pygmalion*; best musical score, Eric Wolfgang Korngold; best musical scoring, Alfred Newman for *Alexander's Ragtime Band*; best original screen play, Dore Schary and Eleanor Griffin for *Boys' Town*; best cinematographer, Joseph Ruttenberg for *The Great Waltz*; and the Irving Thalberg Memorial Award went to Hal Wallis of Warner Brothers for "the most consistently high quality of production achievement."

Hollywood vies with world capitals in the number of newspaper correspondents stationed in the film centre. It is estimated that there are now more than 300 accredited writers sending out news of the motion picture capital. During the year a daily average of more than 100,000 words went out of Hollywood by telegraph and mail.

(L. O. P.)

Technical Developments.—Two developments in photography during the year 1939 have contributed materially to the technical progress of motion picture production. The first of these developments is the 20th Century-Fox silent camera, which is now available to the entire industry. This camera was first designed, and one camera built, early in 1935, and during the intervening time has been in almost constant use in production. The camera operates without any "blimp" covering and at a noise level satisfactory for motion picture sound recording. A full 200° shutter opening contributes to improved photography. During 1939, production of 12 of these cameras was started, and these will be placed in use throughout the industry during the first part of 1940. Motion picture camera technique was greatly advanced during the year 1939 by the use of the new "Metro-Goldwyn-Mayer Flexible Camera Mounting and Crane" which was placed in operation at that studio late in the year. This camera mounting is a small accurately counter-balanced crane, upon which the camera is securely fastened and which by carefully engineered control mechanism permits the camera to be easily moved about the set. The design of the camera mounting, by the use of counter-balances, permits the camera to be freely moved in any direction by the cameramen and in effect the use of this mounting completely frees the camera for any type of desired movement.

With the use of this device, the camera can be panned horizontally or tilted vertically through a 360° arc, without any restrictions. The camera can be placed at any height from a lens height of 11" from the floor to a top height of 16'.

New Films.—The year 1939 brought a further refinement of both negative and positive films used for photography, as well as the introduction of a new fine-grain sound recording stock. This

film makes possible a marked improvement in sound quality by the reduction of ground noise and modulated noise effects. Extensive photo-chemistry research was conducted by the Paramount studio technical organization to determine the negative development formula which would give the necessary low gamma, high density, sound-negative development. The improved results obtained with this film were also furthered by the use of a new mercury vapour light with specially designed optical control equipment. The first two pictures released to theatres using this new stock were the Paramount production *Geronimo* and *The Great Victor Herbert*.

The elimination of grain has always been a major problem to the motion picture industry. Film manufacturers and the various laboratories have co-operated continuously in attempting to reduce graininess. An instrument developed at the California Institute of Technology has recently been placed in use in one of the film manufacturing plants for measuring and determining the graininess of photographic emulsions. For the first time it is now possible to measure and define graininess objectively and the use of this instrument should be of further help in progressing with the reduction in grain in photographic film.

Special Effects Photography.—In the motion picture industry, any type of photography which is not ordinary straight production photography is known as "special effect" photography. During the past few years developments in film available for motion picture production, advancements in photography and laboratory processing, etc., made the use of more and more difficult special effect photography possible.

Equipment for various special effect work was developed as the necessity arose, and to take care of some particular situation. This equipment was usually composed of an assembly of units never originally designed to be combined and worked together. Recognizing this situation, and realizing that the development of a complete special effect process equipment would contribute materially both from an economic standpoint and from a technical and artistic standpoint, the research council of the Academy of Motion Picture Arts and Sciences some time ago commenced a study of this situation which was completed in Feb. 1939 by the issuance of complete specifications for the "ideal" special effect equipment. These specifications included all of the ideas of all of the various studios and for the first time outlined the combined requirements of all of these studios. After the issuance of these specifications, a number of the equipment companies, notably the Bausch and Lomb Optical company, the Mitchell Camera company, the Mole-Richardson Lighting company, the National Carbon company, the Technicolor corporation and Selznick-International studios commenced the co-operative development of the completely new special effect equipment. The completion of this equipment and its use on the production *Gone With The Wind* marked a milestone in the motion picture industry because (1) it represented a complete equipment engineered and designed co-operatively by a number of equipment suppliers, and (2) these companies working together utilized all of the data and information compiled jointly by the potential users of the equipment.

Also in line with the specifications developed by the Academy Research Council, Mole-Richardson engineers, in co-operation with Paramount studio engineers developed a new high power arc lamp for special effect photography which more than doubles the light output available from any previous similar lamp. The following productions produced and released during 1939 utilized special effect photography to a great extent, and this type of photography is considered to have greatly increased their production value: *Gone With The Wind*, *Only Angels Have Wings*, *Private Lives of Elizabeth and Essex*, *The Rains Came*, *Topper Takes a Trip*, *Union Pacific* and *Wizard of Oz*.

The development of several new types of treadmills upon which

the actors are placed in front of the background screen when it becomes necessary to obtain an illusion of movement (as when an actor apparently walks along a street in front of a series of buildings lining that street) has also contributed to the more effective use of special effect photography.

Colour Photography.—A slight increase in the number of colour pictures was made during the year 1939 (18 in 1939, 16 in 1938, 6 in 1937). In addition to these features there were made a great number of short subjects, travelogues and cartoons. The technical advancement of colour photography was furthered by the introduction of a new high speed negative film developed by the Technicolor corporation in co-operation with the engineers of the Eastman Kodak company. The new film permitted a reduction in the amount of light needed to photograph in colour as well as considerably increased the quality of colour photography on the new negative. Advancements in special effect photography in colour during 1939 have removed most of the former restrictions limiting colour photography.

Motion Picture Lighting.—The increasing facility of movement of the camera has necessitated a correspondingly increased freedom of movement in motion picture lighting which has been furthered by the development of a miniature spot lamp. The miniature spot lamp is a small powerful source of light which can be concealed on the set or can be mounted on the camera without upsetting the balance of the camera mounting. The lamp is so small that it can be used on desks behind books, on cafe tables behind menus, or in back of any other small object on the set to give close up lighting without being apparent in the finished picture. A new type of fluorescent lamp exactly matching the quality of daylight, and with a complete absence of glare and negligible heat was recently introduced for use in make-up lighting. Previous lights used in make-up rooms in the studios introduced troublesome colour factors for which corrections had to be taken into account in applying make-up. The use of these new type lamps in a number of the studios has eliminated this problem.

Sound Recording.—The year 1939 found the introduction of an improvement in the recorded quality of motion picture newsreels by the use of "push-pull recording." The RCA Manufacturing company during the year introduced a new light weight push-pull recording system which has found considerable favour with the newsreel technicians. During the year a new light weight exceptionally long "boom," used for hanging the microphone, was introduced by one of the studios which because of its greater efficiency over other type booms has found extensive use particularly for location work where equipment weight is of importance from the standpoint of transportation to and from the studio.

During the year the Warner Brothers studio placed in use a completely new sound track printer which was invented and designed by a member of the studio technical staff. This printer is a considerable improvement over printers previously in use, particularly because of the fact that the "slippage" between the negative and positive has been greatly reduced, and contact between the negative and positive at the point of illumination is such that the reproduced frequency response is better than any previously obtainable from the same negative with other type printers. Printer "weave" has been reduced and the sound track positioning on the film is extremely accurate. The printer has been so designed that full-spectrum or restricted-spectrum (ultra-violet) light may be used, either one of which may be placed in use by an instantaneous selection of filters.

The printer has a number of design features, such as an automatic splice "blooper," a separate optical system for placing clearly printed edge numbers on the film, and other features which are in considerable advancement over the older type printer. One of these printers was placed in use in the studio laboratory during

SIR MALCOLM CAMPBELL set a new world's water speed record of 141.74 m.p.h. Aug. 19, 1939, in his "Bluebird II" on Lake Coniston, England

the year 1939. More will be used. (See also PHOTOGRAPHY: *Motion Picture Photography*.) (G. S. M.)

Motor-Boat Racing.

Although there were few noteworthy developments in either hulls or engines, the attainment of greater perfection in the type already in service and a noticeable increase in reliability, resulted in 19 new speed marks being established by American drivers in the U.S. in 1939. Reliability, too, was the largest single factor in the very creditable showing of Zalmon G. Simmons' "My Sin," winner of America's premier classic, the Gold Cup championship.

"My Sin" was built in 1938 and was thoroughly prepared for the Gold Cup grind at Detroit on Labor Day. In winning she set a new mark of 66.240 m.p.h. for the 90 miles. The President's Cup race at Washington, the only other important event for 12-litre hydroplanes, was also hotly contested and was won by Harold Wilson's "Miss Canada III" after a hard battle throughout the three heats.

The 225 cu.in. hydroplanes continued pre-eminent in the in-board racing field and record-breaking flourished. The veteran Jack Cooper drove his "Tops III" to a one-mile mark of 87.448 miles per hour. "Voodoo," another 225, designed, owned and driven by Chauncey Hamlin, Jr., set a new five-mile standard of 66.176 m.p.h. in the National Sweepstakes Regatta at Red Bank, New Jersey. Other noteworthy marks were set by John L. Hyde's "Gypsy Lass" in the 135 cu.in. class. His figures are 67.479 m.p.h. over a mile course and 52.173 m.p.h. over five miles. Arno Apel set a mile mark of 53.894 m.p.h. in the 91 cu.in. class.

World supremacy on the water, however, still remains in England, for Sir Malcolm Campbell moved his own record farther from the reach of prospective rivals by pushing his "Bluebird II" to 141.74 m.p.h. over a measured mile. (H. L. St.)

Motor Racing: see AUTOMOBILE RACING.

Motor Transportation.

Commercial highway transport is America's fastest growing form of public transportation. This applies equally to motor bus passenger operation, and to motor truck freight operation, each of which represents a separate industry in itself.

Buses.—In the motor bus field two main operating groups are involved. These are companies offering intercity or long-haul

service, and those engaged in purely local service within the limits of a single city and its adjoining suburban areas. Intercity carriers, in turn, group roughly into companies operating within the boundaries of one State, known as intrastate carriers, and those crossing State boundaries, known as interstate carriers.

All types of motor bus companies are closely regulated, either by State, Federal or municipal agencies, and in some cases by all three. Interstate highway carriers have been under Federal regulation since 1935. The Motor Carrier Bureau charged with this regulatory responsibility is a division of the Interstate Commerce Commission and governs both motor bus and motor truck operation that is of an interstate character. Intrastate carriers, those operating solely within the boundaries of a State, have long been under the regulation of their respective State governments. In both types of regulations the fundamental provisions are similar and, in general, consist of rules governing insurance requirements, measures designed to promote safety on the highways, a standard accounting classification, the filing of tariffs and compliance with the rates filed in those tariffs. City or local carriers usually are regulated in a somewhat similar manner by the governing bodies of the cities or municipalities in which they operate.

At the close of 1938—the latest year for which statistics are available—there were 4,007 bus operating companies in the United States. Of these, 746 companies were operating in city service, 2,848 in intercity and long-haul service and 413 in sightseeing and other miscellaneous services. These companies jointly owned 51,500 buses, divided 29,200 in city and suburban service, 20,000 in intercity and long-haul service, and 2,300 in sightseeing and other types of common carrier service. Jointly they operated over 385,868mi. of highway, of which 27,812mi. was in city service and 358,056mi. in intercity and long-haul service.

Motor bus revenue for 1938 amounted to \$465,900,000 divided \$222,610,000 for city carriers, \$234,510,000 for intercity carriers, and \$8,830,000 for sightseeing and miscellaneous operation. Passengers carried by buses in 1938 reached the astounding total of 3,965,020,000. Of these 3,249,120,000 were city passengers, 712,390,000 were intercity passengers, and 3,510,000 were sightseers.

One of the most interesting trends is the gradual changeover from railway to bus operation in cities. The records show that close to 600 cities in the United States, having a population of more than 10,000, are now served entirely by buses, a figure which takes on more meaning when we realize that there are only 982 cities in this population group. The electric railways and their subsidiaries now operate approximately 18,000 buses. The steam railroads also have gone in heavily for motor bus operation. Sixty-five railroads operated about 1,800 buses, while in addition many steam railroad companies hold substantial stock ownership in

motor bus operating companies and thus are directly interested in motor bus transportation.

Still another phase of motor bus operation is represented by the school bus field. While school bus operation is not a source of large revenue—since much of the equipment is school owned and the balance operated under relatively low-priced contracts—it does represent a highly important phase of the nation's educational system. Approximately 36,350 schools use buses to carry pupils to and from their classes, utilizing a total of 80,100 buses. In the neighbourhood of 3,400,000 children are carried daily in

DIESEL TRUCK which made trip from New York to San Francisco and return in 1939 in less than 8 days, with a fuel cost of less than a cent a mile

SPECIAL SIGHTSEEING BUS, with elevated seats and high windshield, introduced in 1939

CAB-OVER-ENGINE International truck

this service, at an annual cost to the schools of \$66,000,000. There are approximately 1,225,000 mi. of school bus route.

Trucks.—In size the motor truck field far exceeds the bus field, and there are many ramifications as to the types of service operated. Trucks are used not only by cartage companies in cities and by long distance haulers, but by private businesses as a part of their service to customers. The latest census by the Automobile Manufacturers' Association shows, for instance, that in 1938 there were 997,127 trucks on farms alone. Registrations for 1938 showed that 4,224,031 trucks of all types were licensed during that year.

The large truck fleets are owned mostly by private shippers. The Bell Telephone Company, for instance, operates 16,210 trucks; Standard Oil of New Jersey, 12,000; the Railway Express Agency, 9,960. According to compilations of the Automobile Manufacturers' Association thirty-one private companies operate more than 1,000 trucks apiece, while approximately 1,000 companies operate truck fleets ranging all the way from 100 to 1,000 trucks apiece. These figures do not include tractors, trailers or cars owned by these companies which in many cases equal and often exceed the numbers of motor trucks owned.

Distribution of Motor Truck Fleets by Industries
(Source: Chilton Company)

As of March 1939	Fleets of 8 or More Trucks	
	Fleets Number	Trucks Number
Bakeries, Candles, Florists	1,602	61,601
Bottlers, Breweries	905	18,367
Coal Dealers, Mineral Mines	1,076	19,202
Contractors, Builders	2,081	49,180
Dairy Products, Milk, Ice Cream	1,795	63,107

Government, State, County, Municipal	1,851	230,374
Ice Dealers, Manufacturers	403	14,191
Laundries, Cleaners, Dyers	1,691	34,967
Manufacturers, Steel Mills	789	11,527
Meats, Fish	686	21,057
Newspapers, Publishers	215	5,125
Oil, Gasoline, Greases	1,333	91,631
Paints, Chemicals, Drugs	192	4,397
Public Utilities, Railroads	1,237	74,248
Vegetables, Farmers, Chain Stores	1,535	39,815
Miscellaneous	659	12,283
Totals	25,058	954,302

Railroad use of motor trucks is rapidly expanding. In 1925 a total of only 900 trucks were used in railroad service. By the end of 1938 this had grown to approximately 64,000 trucks in railroad use. This includes terminal transfer service, intercity service, and store-door delivery. Another 200,000 motor trucks are owned by Federal, State and local governmental departments. A highly significant sidelight on the use of motor trucks was offered by a study of the U.S. Bureau of Public Roads which in May 1939 reported that 80% of all trips by motor truck are under 20 mi. in length. According to another Government survey 60% of all common carrier truckers travel less than 100 mi. per trip.

The trucking industry gives employment to more than 3,000,000 drivers, and an uncounted number of freight handlers, mechanics, and helpers. It is closely regulated in every State as to sizes, weights, speeds, and must conform with innumerable other regulations both State and Federal. It pays annually over \$400,000,000 in special truck taxes over and above all regular levies on business, property, and income. Its proudest claim is that it serves 50,000 communities that are not reached by the railroads.

(C. W. S.)

World Trade.—The beginning of 1939 showed that in spite of the fall in world trade in 1938, the growth of motor transport was continued, though the rate of growth was checked, the addition to the number registered (42,756,000) being only 256,000. Though America is still overwhelmingly the greatest of the con-

	Private Cars Taxis '000's	Trucks Buses '000's	Total '000's
United Kingdom	1,916	626	2,542
France	1,750	500	2,250
Germany	1,366	402	1,768
Canada	1,161	220	1,381
Australia	552	252	804
U.S.S.R.	85	593	678
Italy	303	86	389
Union of South Africa	294	45	339

tinents in the field, the percentage of the world total registered in the other continents rose from 25.8% to 26.8%. Outside the United States, the largest numbers are found in the countries shown in the table above. The figures exclude motor cycles, of which large numbers are in use in certain countries—notably Great Britain and Germany. The number in Great Britain has fallen from a peak of 705,000 in 1929 to approximately 400,000 in 1939, owing to the increase in the popularity of the low-powered car.

The early months of 1939 indicated that the growth in 1938 was likely to be at least repeated, but the outbreak of war in Europe reversed the picture. Severe restrictions were placed on the use of motor vehicles, and, while motor transport is being used on an enormous scale for military purposes, the use of private motor cars and public service vehicles has fallen heavily.

The issue of safety on the roads intensified, though the results of the many efforts made to reduce the toll of death and injuries were meagre. About all that can be said is that the growth in motor transport was not causing a further growth in accidents. In one or two cases experiments hold out some hope of a material improvement. In one area in Great Britain motor control police were so effective that deaths were reduced from 303 persons to 248, seriously injured from 1,839 to 1,050, slightly injured from 5,200 to 2,807. This gave a percentage reduction of 44.1 in the persons killed and injured. Unfortunately, to produce such results requires a large staff. Again, the outbreak of war altered the whole position in the countries affected. Fear of attack from the air caused restriction in street lighting and the shading of vehicle headlights. In spite of the reduction in vehicles on the roads, deaths on the roads have doubled—in Great Britain in September and October 2,009 persons were killed, about double the number in the corresponding months of 1938; and the figures for Germany are equally bad. (See also RAILROADS.) (W. T. St.)

Motor Trucks: see MOTOR TRANSPORTATION; MOTOR VEHICLES: *Commercial Vehicles*.

Motor Vehicles. In the United States the 1940 model year began with the New York automobile show in Oct. 1939. There were 21 makes of passenger cars and nine makes of commercial vehicles on exhibit, representing most of the automobile industry. The outbreak of the war in Europe preceded the European shows by a few weeks, and the automobile shows were cancelled in the leading producer countries.

The 1939 motor vehicle production was 33% larger than the previous year. Factory sales amounted to 3,587,000 motor vehicles with a wholesale value of \$2,224,475,000. Total registration climbed to 29,425,000 with 68% of world registration in the United States. Direct employment in automobile, body and parts factories reached 380,000. Export sales amounted to 474,000, or 13% of the output.

The traffic accident rate showed a further small reduction of 2% in the first nine months of 1939. The number killed was 22,240, a saving of 570 lives over the comparable period of 1938. The reduction was due almost entirely to the smaller number of pedestrian fatalities. The automobile industry has spent much of its time in developing the safety features of the new products.

Most speedometers are now marked with safe driving speed zones. Improved brakes, stronger bodies, better vision, new lights and many others are primarily contributions to safety.

Two outstanding developments were offered by most of the automobile industry in the 1940 models, both of them contributing to the safety of the vehicle. The sealed beam headlight was developed by a co-operating group made up of representatives of the State motor vehicle commissioners, safety organizations, electrical manufacturers, and automobile manufacturers. The headlamp consists of a sealed unit replacing the light bulb, reflector and lens. Two types are made, one with glass reflector and glass lens welded into a single unit, the other made up of a sealed assembly of light bulb, metal reflector and lens. The sealed unit protects the reflector from deterioration and assures proper focus of the beam. Either type is interchangeable with the other. In replacing a burned out bulb it is necessary only to aim the beam to have the lamps in proper adjustment. The new lights have an upper and lower beam and are used with a standard foot switch on all cars. The upper beam has an increased intensity for open road driving. The upper beam has a maximum intensity of 75,000 candlepower, an increase from 50,000 candlepower. Practically all passenger car makes and most light trucks carry these lights. Larger batteries and generators have been put on all cars as standard equipment because of the increased drain on the electrical system. Glass insulation is used to increase the generator capacity.

A new sandwich type safety glass was developed by the glass, chemical, and automobile industry and is standard equipment on most 1940 models. An inner layer made of a polyvinylacetyl plastic retains its strength under extremes of cold and has a long life.

Passenger Cars.—The 1940 passenger car bodies are longer, wider, and roomier. Running boards have entirely disappeared on some bodies and many others are offered either with or without them. Windshields and windows are larger with narrower corner posts. This gives better visibility to the driver and passengers. Curved rear windows of safety glass are used on many bodies. More models use foamed-rubber seat cushions. Plastics are used for ornamentation in increased quantities. In opposition to the trend toward larger vehicles there are now three small-size automobiles made.

The appearance of all models has been completely changed. Hoods are broader and lower. Several models have hood catches operated from the drivers' seats. Many additional designs have headlamps, signal lamps and tail lights mounted in the fenders, adding to the smooth appearance of the body. Die-cast radiator grilles are used more widely. Front seats are wider and bodies lower. Several bodies have front seat widths of 60in. which brings the exterior of the body to the full width of the car across the wheels. With the gear shift removed from the floor, this makes it comfortable for three passengers in the front seat. All bodies have better ventilating systems and heaters have been improved. Many cars have heaters under the front seat which heat both front and rear compartments of sedans. Front fenders are more massive and blend into the sides of the body and hood.

Directional signal lights for indicating turns are standard equipment on several models and optional equipment on many more. Flashing lights, both front and rear, are usually used. A suitable switch or buttons mounted conveniently near the steering wheel are used to operate the lights. One model has an automatic switch for turning the lights off after the turn has been completed. In making a turn, front white lights and rear red lights flash on and off to indicate the direction of turn. In addition, telltale lights are used on the instrument panel to indicate the operation of the lights to the driver.

The compression ratio of engines has been increased to take advantage of the higher octane number of gasolines available in 1940. This results in an increase in power output. The petroleum industry now offers several gasolines of 80 octane number or higher. The trend in higher octane fuels is still up. A number of engines are made with compression ratios of over 7 to 1. In several engines a low pressure of 7 lb. per sq. in. is maintained in the cooling system to increase the boiling point of the cooling solution. This allows driving in hotter weather, in mountains and other adverse conditions without boiling away the cooling liquid.

Increased attention has been given to noise and vibration. Body panels are insulated to prevent resonance and the entire body is often insulated from the frame. Mufflers and intake silencers have been redesigned. Unbalance limits on rotating parts have been made smaller. One company has added a final balance operation on the engine assembly line. A new type balancing machine is used to balance the completed engine to a limit of $\frac{3}{8}$ oz. in. before it is assembled into the chassis. This operation is in addition to the balancing of the individual rotating parts during their manufacture.

Transmissions were the subject of much attention in the 1940 models. Practically all cars with gear transmissions now have the shifter lever mounted under the steering wheel. Many shifter mechanisms were redesigned to make shifting easier. A vacuum operated gear shift was continued by one manufacturer. Automatic overdrives are optional on many models. The overdrive is

an economy device since it reduces the engine speed for level road driving. The driver can return to direct drive at will by pressing the accelerator all the way down.

Fluid flywheel drive is more widely used and a fully automatic transmission incorporating a fluid flywheel has been introduced on one model. This automatic transmission does away completely with the clutch pedal and shifter lever for all forward speeds. The accelerator pedal is pushed to go ahead and the brake pedal to stop. A lever under the steering wheel provides for reverse and a high and low range of ratios. For most driving conditions the lever is left in the high range and the control of shifting the planetary gear system is automatic.

*Preliminary Facts and Figures, Motor Industry
Far Year 1939*

Production and Value

Car and truck factory sales, U.S. and Canada	3,587,000
Passenger cars	2,892,000
Motor trucks	695,000
Percentage increase over 1938	33%
Wholesale value of cars, U.S. and Canada	\$1,776,151,000
Wholesale value of trucks, U.S. and Canada	\$ 448,324,000
Wholesale value of cars and trucks combined	\$2,224,475,000
Wholesale value of parts, accessories and tires for replacement, and service equipment	\$1,243,236,000
Motor vehicles, accessories, service equipment and replacements of parts and tires	\$3,467,711,000

Registration

Motor vehicles registered in U.S.	29,425,000
Motor cars	25,215,000
Motor trucks	4,210,000
World registration of motor vehicles	43,000,000
Per cent of world's automobiles in U.S.	68%

Taxes

Total motor vehicle user taxes	\$1,601,000,000
Gasoline taxes, federal, state and municipal	\$1,021,000,000
Percentage motor user taxes to all taxes from all sources, federal, state and local	11.4%

Employment

Employment in auto, auto body and parts factories	380,000
Weekly payroll, wages	\$11,796,000

Automobile's Relation to Other Business

Largest purchaser of gasoline, rubber, steel, malleable iron, mohair, lubricating oil, plate glass, nickel, and lead.	
Railroad carloads of automotive freight shipped	3,400,000

Used in Automobile Industry

Rubber	80%
Steel	16%
Lumber, hardwood	2%
Copper	12%
Lead	40%
Zinc	11%
Tin	10%
Aluminium	11%
Nickel	29%
Gasoline	90%
Gasoline used by motor vehicles (gallons)	20,550,000,000
Gasoline used by motor vehicles, retail value including taxes	\$4,009,000,000

Motor Trucks and Buses

Motor trucks in use	4,210,000
Total special motor truck taxes	\$420,200,000
Fleets of 8 or more trucks (number of operators)	25,058
Trucks operated by fleets of 8 or more	954,302
Number of truck drivers	3,550,000
Motor buses produced	18,000
Motor buses in use	134,000

Sales Outside United States

Number motor vehicles sold outside U.S.	474,000
Per cent of production sold outside U.S.	13%
Value of motor vehicles, parts and tires exported from U.S. and Canada	\$312,100,000

Motor Vehicle Retail Business

Total car and truck dealers	41,698
Total repair shops	88,929
Total retail outlets, duplications eliminated	95,063
Wholesalers	6,063
Retail gasoline outlets	380,000

A NEW CAR OF 1939 was the small, two-cylinder Crosley, which weighs only 925 pounds

STUDEBAKER PRESIDENT two-door sedan

DODGE four-door special sedan

Left: GEARSHIFTS ON THE STEERING COLUMN appeared on most 1940 models

Above: THE "HYDRA-MATIC" DRIVE on the 1940 Oldsmobile eliminates clutch operation; the crankshaft rotor of the "liquid flywheel" transmits power by means of oil thrown against the vanes of the other turbine-like rotor, fastened to the transmission shaft

Right: THE "SEALED BEAM" HEAD-LAMP, filled with an inert gas, was an innovation on 1940 models

Two additional manufacturers have added independent front wheel suspension to all 1940 models. Only a few cars are being built with conventional leaf springs in front. Coil spring rear suspension was continued on several cars. Frames are longer and wider to accommodate the longer wheelbases and larger bodies. One manufacturer has a full ball-bearing worm and nut steering mechanism to make handling easier.

Commercial Vehicles.—The National Truck Show at Chicago in Nov. 1939 opened the 1940 truck model year. A greater attention to body appearance, following the lines of passenger cars, was noted. Trucks vary more in design than passenger vehicles because of the varied nature of the work they do. One air cooled rear engined truck chassis has been developed. Several rear engined buses are offered in the 1940 line. Aluminium was used generally in bus construction.

Hypoid gear rear axles were introduced on light trucks, allowing a reduction in the height of the vehicle. Cab-over-engine models are offered by most manufacturers. This arrangement allows for a maximum of load space for a given wheelbase. Diesel engines, both two- and four-cycle, are installed by several manufacturers in trucks and buses. For large vehicles on heavy schedules the Diesel is becoming more common.

Mundelein, George William (1872-1939), American cardinal. One of nine children of an early immigrant family from Germany, he was born July 2 in New York city and showed such an aptitude for study that he received his bachelor's degree from Manhattan college at the age of 16. Declining an appointment to the U.S. Naval academy at Annapolis, he entered St. Vincent seminary at Beatty, Pa., where he completed his theological studies, then went to Rome. Here he enrolled in the Urban College of Propaganda, was awarded a doctorate of divinity and, on June 8, 1895, was ordained a Catholic priest. Upon his return to America he became secretary to Bishop McDonnell of Brooklyn and from 1895 to 1897 was pastor of a Lithuanian church in that city. From 1897 to 1909 he was diocesan chancellor of Brooklyn; in the meantime he had been appointed censor of the Liturgical academy Nov. 14, 1903, and domestic prelate Nov. 21, 1906. His rapid rise in the Catholic hierarchy began Sept. 21, 1909 with his appointment as auxiliary bishop of Brooklyn and titular bishop of Loryma. Six years later, on Nov. 30, 1915, he was made archbishop of Chicago and thus became not only the youngest American priest ever to be made bishop, but the youngest bishop ever to become archbishop. With Patrick Joseph Hayes (who died Sept. 4, 1938) he was summoned to Rome by Pope Pius XI who, at the consistory of March 24, 1924, created the two American churchmen cardinals. Two years later he secured the Eucharistic Congress for Chicago. By that time he had completed the \$13,000,000 Semi-

nary of St. Mary's of the Lake at Mundelein, Ill., a town near Chicago named for him. Cardinal Mundelein died October 2 of coronary thrombosis at his home adjoining the Seminary of St. Mary's of the Lake and was buried on October 6.

Municipal Government. Of first importance to municipal Government during 1939 was the rising tide of interest in the vitality of local self-government. The advance in Europe of totalitarian philosophies which dispense with all types of local home rule have served in America to accentuate interest in municipal institutions. This interest is shown not only in local elections, graft clean-ups, the extension of local home rule powers, new municipal charters, the demand for the increased decentralization of relief administration, the opposition to increased central control of education, but also in the statements made by nationally recognized leaders. The words of President Nicholas Murray Butler are worthy of note:

The strength of democracy is measured by the power of local self-government and by the strictness with which limitations set upon distant and central governments are enforced. That people which surrenders local self-government, either from indifference, from inertness, or from a desire to live on someone else's earnings, is on the way out from the temple of democracy.

New emphasis is being thrown upon the meaning of citizenship through the organization of "Citizenship Days" with impressive ceremonies surrounding the induction of voters. The cities of Wisconsin and Illinois have found such programs of value.

Budgets and Prices.—Changes in Federal and State policies have thrown additional burdens upon the cities to finance and administer relief and other local services. The effort to meet this burden in local budgets from current funds and current tax levies has created new financial difficulties in many cities particularly in Ohio, New York, New Jersey, Michigan and New England. The rapid growth of relief needs, together with the increased demands for hospitals and other institutional services, and the new management costs of buildings, boulevards, bridges, parks, playgrounds, highways, sewage systems, water supply systems and other improvements constructed largely by the Federal Government to "make work" are now seen to be upsetting the long established internal balance of local budgets. The first service to feel the pinch has been education, with drastic cuts of school services, as in Ohio and Michigan, and less severe cuts throughout most of the cities of New York State. Those interested in the schools are retaliating by placing their needs before the public more effectively, and are initiating a movement to take the schools completely out of local budgets.

Tax delinquency continues to improve slowly, though 1939 shows little improvement over 1938. There were, however, no significant new defaults on municipal bonds.

The cities are already experiencing slight increases in commodity prices influenced by the war. If hostilities continue throughout 1940, substantial increases are anticipated by city purchasing agents, though no provisions have been made therefor by budget officers. Miscellaneous city revenues have all shown distinct gains especially during the latter half of 1939. The only municipal service thus far generally affected by the war is police. New York city and several other large cities have placed their forces on an emergency basis in co-operation with the Federal Bureau of Investigation of the Department of Justice, extending special protection to steamship piers, foreign consulates, utility plants and other danger spots.

Relief.—Drastic reductions and restrictions by the Federal Government have complicated the relief problem for both the local governments and the States. Congress slashed \$150,000,000 from the President's supplementary appropriation bill for the WPA in the first half of 1939. In June, it reduced the total annual appropriation for WPA by almost one-third as compared with the preceding fiscal year. It also imposed many restrictions, such as the requirement of a 25% State or local contribution, not necessarily a cash one, however; limitation of the cost of building projects; abolition of the prevailing wage policy; abolition of wage differentials in different sections of the United States, except as justified by the differences in costs of living; compulsory 30-day layoffs for those carried on the rolls continuously for 18 months or more; and establishment of a need basis for employment. The effect has been to increase the relief problem for most cities. Particular hardship has been experienced in States where direct relief is left to the local governments. The acute situation in Ohio cities, Toledo and Cleveland in particular, as well as in the rural communities, with respect to the schools and direct relief, attracted nation-wide attention.

Housing.—Low-cost housing received a tremendous impetus through the functioning of the United States Housing Authority. This organization aids local projects through loans and grants. The local authorities bear 10% of the cost of housing projects, besides providing a local subsidy, usually in the form of tax exemption, equal to at least one-fifth of the annual Federal contribution. The number of local housing authorities increased from less than 50 in Dec. 1937, to 250 by the close of 1939. Some 38 States have housing legislation, at least five of which were added in 1939. The legality of State housing authority acts has been uniformly upheld by the courts. New York State implemented its constitutional housing amendment by a public housing law authorizing State borrowing and re-lending to local housing authorities and providing for annual subsidies to help liquidate the loans it makes. New York city inaugurated the first housing program financed entirely by a municipality, through a special city tax on the occupancy of rented business property. The proceeds of the tax are used to liquidate the bonds of the authority over a period of years. A notable study of housing demand is found in a report by Homer Hoyt and L. Durward to the Federal Housing Administration, entitled "The Housing Demand of Workers in Manhattan." There were many new laws enabling local Governments to contract with one another or with State agencies for the performance of numerous public services, such as airport building, police and fire protection, highway construction and personnel administration. Such co-operative service is now most highly developed in California, Michigan and New York.

The documentary film *The City*, sponsored by the American Institute of Planners and shown daily at the World's Fair in the New York City building, was but one of many new steps for bringing local affairs to the attention of citizens and visitors. Among these was the installation of a new Information Center in New York city. Reports from city planning commissions indicate that planning has passed from the "city beautiful" stage and is now equally concerned with the economics of urban development. It is particularly significant that there is open discussion of the danger of zoning too large a frontage for business development in view of current population trends.

There were extensive activities in public service training for both local and State employees in various parts of the U.S. The State Education Department of New York adopted regulations relating to the approval of in-service training courses and the granting of certificates. In New York State alone 20,469 public servants attended training courses in 1939.

The downward trend in the number of traffic deaths continued

throughout 1939, despite an increase in highway traffic. Automobile thefts showed a drop of 5.2%, though other major crimes showed a similar increase, murders rising by 4.6%. (L. Gu.)

Munitions of War. During the first three weeks of Sept. 1939, German forces aggregating approximately 1,000,000 men put to utter rout the entire military machine of a nation of 30,000,000. And although the latter counted only two-thirds as many effectives (regular army) as the former, available reserves, if employed, as they presumably were, just about reversed this ratio—in favour of the defender. The Poleš, brave soldiers all, were fighting for home and fatherland with the courage of desperation. Why then such swift and overwhelming defeat?

Military experts ascribe two causes for the debacle, viz: (a) Inept Polish strategy, and (according to most observers, much the more important) (b) Insufficient equipment in all modern munitions.

As an example of such insufficiency, it is recorded that of the 70 to 80 German divisions in the field, six were fully mechanized, and four more, motorized, while no comparable units existed among the 40 to 60 Polish (regular) divisions engaged, and obviously none among the reserves. Further, each German division boasted 72 anti-tank, and 12 anti-aircraft guns, as against 18 and 4 respectively for similar Polish commands, while in the air, Germany was prepared to crush Poland's 800 to 1,000 planes with some 8,600 of her own. Reviewing these figures we arrive at the following ratios:

	Men	Anti-tank guns	Anti-aircraft guns	Aeroplanes
Germany	1 (Approx.)	4	3	10
Poland	1	1	1	1

Other things, then, being equal, it would appear that the nation possessing the largest number of ultra-modern munitions is likely to achieve victory in military operations of today.

Hordes of men and masses of modern weapons do not necessarily, however, spell success. Other factors, such as morale and leadership, must receive consideration. Witness the failure of the Russians, most of whose older and abler officers had been "purged" in recent years, to crush, despite overwhelming superiority in men and munitions, the stout Finns in the undeclared war which they initiated in the late fall.

Other things being equal, the quality and quantity of the munitions possessed by one side or the other may readily be the deciding factor. To achieve superiority in these elements is, however, not as simple as it may sound. Indeed the mere acquisition of the very minimum sufficient to the demands of a major military offensive, or defensive, cannot be assured unless:

(1) The numbers required have actually been fabricated and issued to troops, or placed in storage, prior to the commencement of hostilities, or

(a) adequate stocks of all the raw materials entering into their composition, the sources of which lie without the nation's borders and the supply of which is likely to be disrupted or severed when operations commence, have been purchased and actually received, and

(b) necessary provisions made to assure the rapid and uninterrupted conversion of these into the finished product as soon as any indication for this arises.

Obviously, the first answer appears the simpler. In reality, the solution lies between the two. For it is difficult to estimate very long beforehand, either as to type or quantity, the exact requirements, in munitions, for the conduct of a major military operation. Thus, had the United States, at the termination of the World War (1914-18) determined to manufacture and issue or store all of the items of munitions required by an army of, say, 4,000,000, over a period of one, two, three, or four years of active campaigning, and been prepared to spend the billions which such an effort demanded, it would now have available a supply of these sufficient for the arming of a force much larger than it is likely to assemble for a long time to come. But the

majority of these would be obsolete, or obsolescent. Ammunition would in large measure have become unserviceable and require replacement. Gas masks would long since have deteriorated. Guns would be inferior in range and mobility as compared with types recently developed. And imagine a few thousand tanks, or aeroplanes, of the vintage of 1918 being uncased and assembled for active service, anno Domini 1940!

Not only do weapon types change over such a period, but likewise the proportions in which they are employed. Thus the tank, anti-tank gun, and the infantry mortar have not only undergone tremendous improvement since 1918, but the quotas of those issued per tactical unit have been multiplied by several hundred percent. The same holds for aircraft, anti-aircraft armament, and, at least so far as numbers are concerned, for machine guns, though changes in the last-named have scarcely been as revolutionary as in the other varieties. Thus a supply of any of these weapons adequate to the requirements of an army of 4,000,000 in 1918 would be woefully inadequate in a war of tomorrow.

On the other hand, the purchase and storage of stocks of raw materials vital to the fabrication of munitions, but not produced, or inadequately produced, within the homeland, and hence likely to become unavailable or insufficiently available after hostilities commence, is but the beginning of an answer to the problem. For it has been learned by sad experience that the period required by manufacturers not previously trained in their production to convert these into finished munitions varies, no matter how modern their plants and skilled their operatives, from a number of months to considerably more than a year, during which an active and fully armed aggressor can wreak unending havoc. Nevertheless, it remains an important, indeed an absolutely essential, beginning; for lacking such reserve stocks a suddenly established blockade can instantly and completely shut off all further supplies. Hence the active efforts now being made, and made for years past by all major nations doubtful of the security of their naval lanes, to acquire such stocks against the day of need. Even the United States, finally awakened to the necessity for speedy and comprehensive action in this direction, has now undertaken active steps toward the procurement of many vital raw materials in quantities of considerable magnitude.

But this is only the beginning. The building of many types of munitions is an art in itself—one not practised in time of peace save in a few Government arsenals operating with skeleton staffs. And even when fully staffed, and working under the stimulus of wartime conditions, these are unable to supply more than a minute fraction of the total requirements. As already indicated civilian manufacturing plants, having no demand for such products, lack experience in the art and must acquire this before they can, when the tocsin sounds, turn out such items in the quantity and quality which the exigencies of war demand.

So, in addition to the raw materials, it becomes necessary to educate, at the Government's expense, a selected group of such civilian producers in the fabrication of the finished products, not after hostilities commence, but before. Not until the executive and operating staffs of enough of these have been trained in the accurate and speedy construction of the most essential items of an army's equipment and are prepared to convert their plants, practically overnight, from the production of instruments of peace, to those of war, may a nation, in these parlous times, breathe easily. Even then, it dare not lessen for an instant such efforts toward its military security.

Thus, in the last analysis, this security depends upon:

(1) The organization, thorough arming (with the most modern weapons) and training of a force (regular and reserve) sufficiently numerous to ensure the successful defence of the State if suddenly attacked by a major opponent, until it can adequately be reinforced through the usual channels of voluntary service and conscription.

(2) The laying up of reserves of raw materials sufficient to a major military effort of one to four years.

(3) The education of civilian manufacturers in the fabrication of products strictly military in character and not ordinarily produced in time of peace.

(4) The advance preparation of an elaborate and comprehensive plan which will ensure that the thousands of factories whose facilities will be required in a war effort will be in a position to commence their conversion toward the objectives of such an effort within 24 hours after the bugle sounds.

Passing from the general to the specific in the field of munitions, 1939 witnessed much progress in the perfection of existing types—little by way of innovation. Probably the most exciting development in the latter category was the employment by the Germans against the British of a new sea mine of "magnetic" character. While the details of their make-up and exact mode of operation remain military secrets, best naval opinion seems to hold that their firing mechanism must incorporate a circuit-closing device (for detonation of the priming element) the operation of which is initiated by the near approach of any large object capable of exerting a magnetic influence—such as a steel vessel. Beyond this, all is conjecture, though it is hinted that the British, as a result of careful laboratory studies made on specimens which drifted ashore, have solved the intricacies of their construction.

Since most of the latest improvements in munitions, as now being employed by European contestants, received their preliminary try-outs in the Spanish Civil War, it may prove useful to examine conclusions of military observers as to how successfully, or unsuccessfully, various of these fulfilled their missions. Some of the pronouncements have been as follows:

(1) The anti-tank arm has shown itself capable of coping with any tank attack.

(2) Armoured attacks (*i.e.*, by tanks) must have the support of the other arms—infantry, artillery, aircraft.

(3) Low-flying aircraft can at times be the decisive factor in an engagement, and are almost always able to render service of the utmost value.

(4) Fast-flying planes tend to overreach their targets.

(5) Bombing from the air fails to demoralize civilian populations.

(6) Anti-aircraft artillery performed most efficiently, its moral effect likewise being most noticeable.

(7) Too few tanks were used to answer the question as to whether these can be counted upon in future wars to break up a stalemate. Light types were less effective than heavy models, and even the humble hand grenade was used with some success by infantry against these lumbering juggernauts.

(8) The individual infantry soldier must not be overburdened with loads of ammunition for his accompanying weapons—machine guns, trench mortars, and light cannon.

Let us see what weapons actually underwent the test of fire and steel during the Spanish conflict:

Tanks.—The Insurgents employed two general types, viz: The German light tank and the Italian Fiat-Ansaldo tankette. The former weighed $5\frac{1}{2}$ tons, had an overall length of 13ft., a top speed of 30 m.p.h., and carried armour of 0.6" maximum thickness. It was equipped with two machine guns, manned by a crew of two; possessed a rotating turret but no radio.

The latter weighed 3.6 tons, was 10ft. long overall with a maximum speed of 27 m.p.h. and armour 0.51" thick. Its weapons were one to two machine guns. The crew again numbered two. It had neither rotating turret nor radio. Against these the Government forces mustered the following varieties: Trubia (light) Spanish, Renault (light) French, T 26 (light) Russian, Christie-Ruski 34 (medium; convertible) Russian, and T 28 (medium) Russian.

These weighed 7, 8, $8\frac{1}{2}$, 14, and 19 tons respectively, with overall lengths to 21.6ft., speeds to 40 m.p.h., and armour from .43" to 1.0" thick. Guns varied from three machine weapons (Trubia) to one 45mm. cannon and 3 machine guns (T 28). Crews ran from two to five or six. All had rotating turrets, and the T 26 and T 28 were occasionally equipped with radio—the rest not.

It thus appears that the Insurgent tank equipment, though speedy, was uniformly too light, and weak in arms, armour, and radio facilities, whereas most of the Government types were reasonably well equipped in these particulars. It is not therefore sur-

Upper left: BRITISH 3.7-IN. ANTI-AIRCRAFT GUN which fires up to heights of 36,000 feet
 Above, left: FRENCH 155-MM. GUN which fires a 95-lb. shell 10 miles
 Above, right: FRENCH 8-MM. HEAVY MACHINE GUN, in position for anti-aircraft fire
 Right: LIGHT FIELD ARTILLERY PIECE of the German army: a 75-mm. howitzer
 Below, left: ANTI-TANK GUN of British army, with effective range of 1,000 yards
 Lower left: BRITISH BREN .303-IN. LIGHT MACHINE GUN, used chiefly for attack
 Lower right: GERMAN 81-MM. TRENCH MORTAR, fired by dropping a bomb into the muzzle

prising that the Insurgents suffered many tank losses, rather is it to be remarked that these were not more extensive.

Anti-tank.—Calibres and varieties of anti-tank weapons included: Hotchkiss (French) 13mm. and 25mm., Oerlikon (Swiss) 20mm., Rheinmetall (German) 37mm., Bofers (Swedish) 40mm., Italian 65mm. infantry cannon. The effectiveness of these was variously estimated as follows: 13mm. (.50 calibre), its solid projectile proved inadequate; 20mm., this piece, weighing but 700-lb. and capable of a rate of fire of 300 rounds per minute, penetrated 1" armour at 500-700yds., and proved highly efficient; 25mm., effective, but of excessive weight (1,760lb.) and low rate of fire (180 rounds per minute); 37mm., opinions differed, some considered rate of fire too slow; effectiveness generally conceded; 40mm., no observations recorded; 65mm., too heavy, and lacking in mobility.

It would appear, then, that while almost any well-designed gun of 20mm. calibre or above can cope successfully with the average tank, those possessing features of light weight and great rapidity of fire proved more satisfactory than such types as lacked these characteristics.

World War figures compared with statistics based on the Spanish conflict, indicate that the percentage of tanks put out of action by gunfire (80-90% of all lost in battle) has increased slightly—from 17% of those engaged in 1918 to 19% in 1939—thus supporting the conclusion already cited: that development in anti-tank defence has closely paralleled that of the tank itself. Considered opinion holds that even greater losses (with a minimum of 25%) must be expected in the future.

Aircraft.—Although enormously improved since the World War, aircraft (when not enjoying great numerical superiority, as in the German invasion of Poland) while occasionally turning the tide of battle, did not prove a decisive factor in military operations. As already noted, constant bombing failed to break civilian morale. Nor, in many instances, did it succeed in disabling objectives of strategic importance. Thus, of 38,000 bombs dropped on the power houses in Barcelona and Sagunto during Spain's 2½ years of Civil War, exactly six made direct hits!

Nevertheless, as a combat arm the aeroplane developed increasing significance, completing the artillery preparation and often closely supporting the infantry attack as well. Even more successfully was it employed in the counterattack, having proved the defender's quickest and most effective means of halting the enemy. Power-diving from great heights to positions 150 to 300ft. above hostile ground troops, ships in groups of 15 to 50 executed short but violent raids, circling above their quarry and harassing him with bombs and machine gun fire. (At 1,000ft., the altitude formerly kept, anti-aircraft fire was effective; at the new low altitudes the enemy became panic-stricken and dashed madly for cover.)

Anti-Aircraft.—Divergent opinions continue to be registered as to the percentage of planes brought down by other ships and by anti-aircraft fire. Thus an excellent authority states that pursuit aviation accounted for nearly 75%, anti-aircraft artillery, 20%, and small arms, 5%, whereas other military experts of high repute attribute to anti-aircraft fire no less than 80% of all plane casualties. Probably both opinions are correct, the discrepancy being due to the fact that, in the first phases of the World War, planes were slower, flew lower, and paid little attention to ground weapons, hence the heavy toll taken by these during that period.

Anti-aircraft guns of small calibre (20mm.) were found highly effective for front line defence, where planes swooped low to attack, but for the security of rear positions subject to bombing from high altitudes those of much larger calibre (e.g., 88mm. or 3.6") proved necessary. Improvements in fire-control systems based on sound ranging were such that creditable reports indi-

cated that no plane would survive 15 successive shots fired at it by an anti-aircraft battery into whose range it flew at an altitude of less than 12,000 feet.

So much for actual trials of munitions in the field. With respect to new or improved methods and devices, or the more efficient applications of older ones, first disclosed to the world in 1939 and yet to stand, over long periods and under all conditions, the acid test of war, we may discuss in turn those applicable to operations on Land, Sea, and Air.

Land Warfare.—Mechanization and motorization received increasing attention from all major military establishments. Thus the British announced, early in 1939, the motorization of three Territorial (National Guard) divisions, each incorporating, among other units a motorcycle battalion and a radio-equipped motorized company of Field Police (to control and direct traffic while on the march), these in augmentation of one partly mechanized division and one mechanized brigade in the regular establishment. France has thus far developed three mobile (partly mechanized) divisions, Italy four. Each of these latter includes in its armament and motor equipment, 148 light and 66 heavy machine guns, 38 minethrowers, 36 field pieces, 30 tanks, 16 armoured reconnaissance vehicles, 400 motorcycles, 650 light, 183 medium and 320 heavy trucks; or about 1,000 motor vehicles all told. The new United States "triangular" division (mechanized and mobile) five of which (four infantry; one cavalry) are in process of organization, has a war strength of 11,500, and is equipped (infantry) with 1,357 motor vehicles as against 1,000 for the old division of almost double its size, though it does not, as yet, embody any tank elements. Even the relatively small Swiss Army entered the year 1939 with 45 motorized batteries of various calibres, their road speeds varying from 9 m.p.h. for the 120mm. gun to 44 m.p.h. for the 105mm., and presumably even more for those of lesser calibre.

Russia announced nine independent mechanized divisions in her regular army, with five more in the reserve. In addition she is said to have somewhere between 25 and 55 combat car regiments of two to three battalions, 13 independent combat car battalions (belonging organically to the infantry division), 12 independent combat car companies, at least five (probably more) completely motorized rifle divisions, and 9 mechanized brigades designed for employment in connection with the larger cavalry organizations for increasing their shock power. In the last-named units, riflemen are transported in fast trucks accompanied by organic artillery. Certain of her mechanized commands have been grouped into three motor-mechanized corps, each of two mechanized and two motorized brigades, and 23 independent brigades of mechanized units and tanks, apart from 13 independent tank battalions. Her total strength in tanks was estimated at 5,000—many of these in special categories (flame-throwers; smoke-emitters, etc.). Disregarding the lessons of the Spanish war, she was sacrificing armour to speed, insisting that the latter offers greater protection than do walls of steel. Thus her heaviest standard tank (36 tons) which mounts one gun of 75mm., two of 37mm., and two machine guns, is capable of 18.6 m.p.h., while her light amphibian (3.2 tons) makes 25 m.p.h. on land and 6.2 in water.

Certain tank authorities foresee the gradual separation of these instruments into three general categories (apart from specialized types), viz:

Accompanying Tanks (light): weighing up to 10 tons, manned by crews of one to three, with 37mm. guns as their heaviest pieces, and a maximum (battlefield) speed of 5-6 m.p.h.; armoured to resist infantry weapons but not anti-tank cannon.

Leading Tanks (medium): heavier and better armoured than the former, with larger crews and more powerful guns, their mission being to open a breach for the smaller types and the infantry. An example is the French "D" tank of 15-17 tons, with minimum armour thickness of 20mm., armed with a 47mm. gun and two machine guns. With a radius of action of 50mi., it possesses a maximum speed of 12 m.p.h., and an average speed

(in action) of 5 miles per hour. Its short wave radio is effective to a distance of 3-6 kilometres.

Special Mission Tanks (Heavy): for attacking anti-tank batteries and hostile tanks. Their weight averaging 20-30 tons, armament includes guns up to 75mm. in calibre. Still heavier types may mount guns of even 155mm. bore, and as many as 8 machine guns. With armour $1\frac{3}{4}$ - $2\frac{1}{2}$ " thick, these can withstand the shell of the 75mm. field gun, but their slow speed and great weight (up to 98 tons) will seriously limit their employment.

Reconnaissance Cars: The French have developed a 60 km.p.h. armoured reconnaissance car with an average speed of 40 km.p.h. and a range of 200 kilometres. It carries a 37mm. gun and two machine guns of alternate calibres. A wheeled vehicle, it weighs $6\frac{1}{2}$ tons and is manned by a crew of five.

For closer reconnaissance there is a 55 km.p.h. car, capable of a cross-country speed of 17 kilometres per hour. It weighs 6 tons, operates on tracks with a crew of two, and mounts two machine guns.

In heavier types we find the armoured combat car of 50 km.p.h. top speed. Its normal road speed is 30 km.p.h., and its cross-country speed, fifteen. Weighing 12 tons, it has a three-man crew which manipulates a 37mm. cannon, and machine guns.

Artillery.—The new 155mm. field gun just developed by the U.S.A. is considered equal or superior to any comparable piece in existence. Weighing 30,765lb., it possesses the remarkable range of 25,000 yards. Capable of high elevation (65 degs.) and all-around traverse, it and the 155mm. corps howitzer handle the

same shell interchangeably. In lighter types, the manufacture of her 37mm. anti-tank weapon, but a single pilot model of which was available in 1938, is now in full swing. This little gun, mounted on a pneumatic-tired carriage with split trail, is capable of wide traverse, and discharges, at a muzzle velocity of 2,600 ft.sec., a projectile capable of penetrating $1\frac{1}{2}$ " of the best armour at 1,000 yards. Light in weight (only 900lb.), it may readily be manoeuvred into position by man power.

Gas.—Though accusations and counter-accusations have been made, there appears to have been no authentic instance of the employment of gas in military or naval operations during 1939. Thus the gloomy prognostications of whole cities being wiped out by toxic gases rained from above show, to date at least, no indication of being fulfilled.

Sea Warfare.—The outcome of the naval battle between the German pocket battleship "Graf Spee" and three British cruisers off the coast of South America in December, astonished a world which up to that time had been convinced that the heavy guns (11") of the "Graf Spee" and other ships of her class would inevitably sink any less strongly armed vessel before it could approach close enough to employ its pieces effectively. (The largest weapon carried by any of the British vessels engaged was of 8" calibre.) The answer to the apparently anomalous outcome

Above: AMERICAN 37-MM. anti-tank gun

Left: GERMAN MORTAR which fires a 240-lb. high-explosive shell

Right: TWELVE-INCH German railway gun, capable of firing a 700-lb. shell 20 miles

Below: THE U.S. ARMY ordered 65,000 Garand semi-automatic, .30-calibre rifles Oct. 10, 1939, as the first step in equipping all infantrymen with this powerful new weapon

of the engagement is yet to be disclosed.

Air Warfare.—As in the case of gas, the myriads of high-explosive and incendiary bombs which the capitals of Europe had expected to descend upon them immediately following the commencement of hostilities, failed in most instances to materialize. True, in those cases where one contestant held overwhelming air superiority (e.g., Germany *v.* Poland, and Russia *v.* Finland), bombing of certain non-military objectives (as in Warsaw and Helsinki) was ruthlessly carried out, with many attendant civilian casualties. But when a strong counterattack could be expected, belligerents let each other's civilian centres severely alone.

Among the agencies of air warfare, planes steadily became faster, more heavily powered and armed, and capable of longer flights from their bases. Speeds now mount to well above 350 m.p.h. (as against about 125 m.p.h. at the termination of the World War, 1914-18) with operating ranges up to 3,750 mi. (350 in 1918).

The Diesel motor continues to receive serious attention in certain quarters. Reinforced plastics (for moulding fuselage and wings) are rapidly coming to the fore, it having been demonstrated that a bandful of men can produce, from such materials, either of these structural elements of a plane within a few hours. Though not as yet generally adopted, all portents appear to indicate that, as the wood-and-fabric plane gave way to the all-metal, the latter must now look to its laurels if it is not to be superseded by its plastic rival.

Anti-Aircraft.—Weapons are constantly increasing in calibre and range. Thus the tendency in the British service is toward a minimum calibre of 90 to 100mm., with even 150mm. not entirely out of consideration. (The new aircraft carrier "Ark Royal" mounts anti-aircraft guns of 115mm.) When the bore equals or exceeds 100mm., however, the rate of fire slows to 15-20 rounds per minute, whereas the smaller, fully automatic weapons, can operate at 100 rounds per minute and more. (See also AIR FORCES; ARMIES OF THE WORLD; EUROPEAN WAR; NAVIES OF THE WORLD.)

Murphy, Frank (1893-), U.S. jurist, was born April 13 at Harbor Beach, Mich. He was made a bachelor of laws by the University of Michigan in 1914 and then continued graduate study at Lincoln's Inn, London, and at Trinity college in Dublin. He practised law in Detroit from 1916 until the United States entered the World War, when he went to France as a first lieutenant and later captain of infantry. After his discharge from the army of occupation in Germany in 1919 he returned to Detroit and was appointed chief assistant to the United States attorney for the eastern district of Michigan. From 1923 to 1930 he was judge of the Recorder's (criminal) court in Detroit, and in 1930 he was elected mayor of the city. Re-elected in 1932, he resigned in May 1933 to accept appointment as governor-general of the Philippines. Reputedly at the suggestion of President Roosevelt he ran for governor of Michigan in 1936 and was elected. During his administration he was widely criticized for not taking action to control the sit-down strikes of 1937 in Michigan, and in 1938 he was defeated for re-election by Frank D. Fitzgerald (q.v.). Roosevelt then appointed him U.S. attorney-general to succeed Homer S. Cummings, and he was sworn in to this office on

Jan. 2, 1939. He showed great energy and travelled over the nation throughout 1939 investigating charges of corruption and fraud. Among his successful prosecutions were those of Judge Martin T. Manton of New York and Thomas J. Pendergast of Kansas City. On Jan. 4, 1940 President Roosevelt nominated Mr. Murphy associate justice of the Supreme Court to succeed the late Pierce Butler.

Music. The political situation of the world has vitally affected both composer and performer. The year 1939 has intensified the relation of art to society. It has been a year of political chaos, a year in which the easy relationship of peoples of one culture with those of another has been very nearly stopped. The Spanish civil war of the past few years interrupted the musical life of Spain. Germany's attack upon "cultural bolshevism," upon degenerate music, upon Jewish music led to an exodus, by no means limited to the Jewish race, of established German musicians, weakening unmistakably the musical fecundity of that country. Italy's attack upon the Jew, brought about by the Rome-Berlin Axis, exiled once again more talent of Italy. The year 1938 witnessed the cancellation of Austria as a musical centre; 1939 has seen the cancellation of Czecho-Slovakia, of Poland and of Finland. "Black-outs" and mobilization have for the moment stopped what musical life was left in other centres.

The immediate effect of the political situation is an intensification of what has been occurring for the past decade. Neutral countries, somewhat removed from the strong currents of conflict, become the retreats for an increasing stream of exiles. These countries, still in a position to foster an active musical life, and favoured by the increasing talent that is available for the carrying on of such activity, find themselves taking over the functions that were formerly assumed by the large music centres of Europe. While a review of musical productions for the first part of 1939 must still give space to the activities in London and Paris, that for the last half of the year must shift to Switzerland and other neutral countries of Europe and to the Americas.

The position of the Americas in the musical world is a unique one. While concert life even in Switzerland and other neutral countries has been affected by mobilization and by the uncertainty that comes from too great proximity to the belligerent nations, the American nations, however much their economic life is affected by the world situation, have not as yet felt any curtailment of their cultural activities. Moreover, this shift of the spot light to America comes at a time when the contribution of American composers and performers is being more felt and more recognized, with the result that the situation created is a new and vital one. Exiles have arrived in great numbers in the United States, it is true, and their musical activity is being felt, but the importance of the work that American composers are doing is increasing and the effect is stimulating both to the composers themselves and to American concert life. It is not impossible that in time America will do as much to change the idioms of exiled composers living there, as the exiles will do to effect change in the American idiom.

The usual international festivals of music that occur during the spring and summer took place, and on their programs were heard some works of interest. The 17th Festival of the International Society for Contemporary Music (S.I.M.C.) met in Warsaw in April in spite of the acute political tension at the time. On its programs were few works by the most known modern composers. Either the more established composers do not feel that they should use these programs for the presenting of their new

works or else the international situation was such that they wished not to do so this season.

Of the new works performed some were of real interest. Francis Poulenc's *Messe en Sol-majeur* revealed a new side to that composer's temperament which may mean a great deal in the future of his expression. On the whole the concerts showed once more a movement away from the more extreme methods of expression. Two works, both using with great ingenuity the 12-tone technique, achieved success: a scherzo-finale of a concerto for violin and orchestra by Vladimir Vogel, and *Five Orchestral Pieces* by the English composer Christian Darnton. The 1940 festival of the S.I.M.C. is scheduled for Budapest. Neither the Baden-Baden Festival of Contemporary Music nor the 7th International Festival of Music at Frankfurt were of very great interest. The difficulties in organizing these festivals on an international basis must have been almost insurmountable. To find composers and performers who were willing to appear on these programs and who were acceptable to the Foreign Office must have been a Herculean task. Most of the compositions were by younger German composers, with a few works such as G. Francesco Malipiero's *Hecuba*, a string trio by Jean Rivière, and a ballet, *La Rosière du Village*, by Henri Tomasi, to give the impression of an international scope.

The "Maggio Musicale Fiorentino" established in 1933, though not pretending to be in any way an international festival of music, is nevertheless an occasion of considerable interest. In 1938, Malipiero's ingenious "Dramma per Musica" *Antonio e Cleopatra* was performed. One of the most interesting productions of the festival was Orazio Vecchi's "Madrigal Opera" *L'Amfiparnaso*.

It must be admitted that though the international festivals in Europe in the past may have been truly international in their scope, this was not true of them in 1939. There were, however, festivals of contemporary music in the United States which were broader. The series of concerts by various nationalities presented at the World's Fair of New York might well be termed a festival, and though these concerts presented but few first performances they did present an international viewpoint. The most outstanding concert was that of music by Brazilian composers, in which the music of Villa Lobos had a great success. Three first performances of new English works were well received: Arnold Bax's *Seventh Symphony*, a *Piano Concerto* by Arthur Bliss and *Five Variants on "Dives and Lazarus"* by Vaughan Williams. With one exception no American work appeared on this series of concerts at the World's Fair. This exception was Walter Piston's *Prelude and Fugue*, included by the courtesy of Sir Adrian Boult. (It should be mentioned that the Composer's Forum of the WPA presented an outstanding series of concerts of chamber music by American composers.) It was left to Serge Koussevitzky to present the concerts of American music that might well have been included on this international occasion.

At an American Festival in Boston were presented works of great variety and interest, ranging all the way from Arthur Foote's *Suite for String Orchestra*, Howard Hanson's *Romantic Symphony*, Gershwin's *Concerto in F.*, Randall Thompson's *Second Symphony*, to Roy Harris's *Third Symphony* and an *Overture* by a new young American composer, William Schumann. Such a festival of American music by a major symphony orchestra was truly daring, yet it was accepted as a matter of course, was well received, and was repeated in New York city.

Of the many other festivals of music held in the United States the Berkshire Festival should be specially mentioned, for it is planned to extend this festival with a summer academy somewhat

IGNACY PADEREWSKI began his farewell tour in America Feb. 26, 1939, with a concert broadcast from New York city

on the order of the Salzburg Festival. In conjunction with the usual symphonic concerts there will be a course in conducting under Serge Koussevitzky and courses in composition by Aaron Copland and Paul Hindemith.

The usual repertoire of standard operas continued in spite of the tenseness of the times. With the declaration of war most opera houses in cities that feared bombing were closed, but there were already plans for reopening a few of them. Several new operas of a conventional type were performed. In Italy *Re Lear* by Vito Frazzi was produced at the spring festival in Florence; *Re Hassan* by G. H. Ghedini was staged at the Teatro della Fenice in Venice; and *Il Candelieri* by Ezio Carabella was given in Genoa. In Paris, Henri Sauguet's opera *La Chartreuse de Parma* based on a libretto adapted from Stendhal by Armand Lunel achieved a moderate success. The movement towards a more dramatic yet musically stylized work that dominated the period following the great war may still be followed. Performance during 1939 of Hindemith's *Mathias der Mahler* and Malipiero's *Antonio e Cleopatra* showed that interest in a revitalized form of dramatic expression is not dead. The great success of the former led to its repetition in Switzerland and performance elsewhere. Hindemith's opera *Cardillac* was revived in Zurich. In line with this more progressive thought are also the new works by Darius Milhaud and Arthur Honegger. Milhaud's new opera *Médée* (text by Madeleine Milhaud) had an apparently successful premiere in the Royal Flemish Opera house of Antwerp. Honegger's "Oratorio-Dramatique," *Jeanne d'Arc au Bûcher*, composed to a poem by Paul Claudel, was pronounced on its performance at the Municipal Theatre of Orleans to be his finest achievement since *King David*. Two new works by this composer: *La Danse des Morts*, also to a text by Paul Claudel, and *Nikolas von der Flüe* are to be performed in 1940 in Switzerland. Yet this production of new operas of the more radical type was not the only sign of the interest composers have in the form. A manifesto "Pour un renouveau du Théâtre-Lyrique" was signed by several outstanding French composers: Auric, Delannoy, Honegger, Jauher, Milhaud, Poulenc, Poland-Manuel and Germaine Tailleferre. In New York city a new American Lyric Theatre was organized for the purpose of performing operas and ballets of American interest. This organization produced with definite success during the month of April two new operas: *The Devil and Daniel Webster* by Douglas Moore to a libretto by Stephen Benet, and *Susanna, Don't You Cry* to a score by Clarence Loomis including music by Stephen Foster. A most interesting opera score was *The Old Lady and the Thief*, written on commission for the National Broadcasting Company by Gian-Carlo Menotti, whose one-act opera, *Amelia Goes to the Ball* was successful in 1938 at the Metropolitan Opera. That there will eventually develop a "radio" opera there can be no doubt, and this new opera by Menotti is a noteworthy attempt in that direction. (See DANCE: Ballet.)

It would be impossible to enumerate important performances by even the greatest symphony orchestras and chamber music groups. Such performances were the first to be revived after the first shock of the crisis. Concerts in Germany tended to be limited, as might be expected, to performance of German classics and to works of young composers who have, as yet, achieved no hearing outside of that country. In England there was considerable activity on the part of the British Broadcasting Company for the performance of new works. A first symphony by Erik Chisholm and a piano concerto by William Busch were performed. *Symphonic Studies* by Alan Ravsthorne and a string quartet by Elizabeth Lutyens were performed at the Contemporary Music Festival at Warsaw. A new violin concerto by William Walton was scheduled to be given its premiere performance by the Cleveland Symphony with Heifetz playing the solo part. In France three new

string quartets were performed by Maurice Jaubert, Henri Tomasi and Olivier Messiaen. A new piano concerto by Jean Francaix was given when Nadia Boulanger conducted the New York Philharmonic-Symphony during her visit to America. Jean Rivière was represented at the Festival of the S.I.M.C. by a *Symphony in D Major* and at the Baden-Baden festival by a string trio. The interest in new Italian music centred largely in the Florentine productions. Among the works performed were G. Francesco Malipiero's *Concerto à Tre*, a violin concerto by Gino Gorini, a pupil of Malipiero, and a cantata by Leone Massino. The first performance of Castelnuovo-Tedesco's second Piano Concerto was given November 2 by the New York Philharmonic-Symphony. Two new symphonies were performed in Helsinki: Uuno Klami's *First Symphony* and Lauri Ikonen's *Second Symphony*. Bela Bartók's *Rhapsody* for clarinet and violin was given a sensational first performance in New York city by the famous Hungarian violinist, Szigeti, and the great exponent of "swing," Benny Goodman. Not to be outdone by the critics who discover infant prodigy virtuosos, two critics sang the praise of two infant prodigy composers, both of America. Lukas Foss, horn in Berlin in 1922 and now living in Philadelphia, was praised by Paul Rosenfeld. From Paris came the praise of critics for the compositions of nine-year-old André Mathieu, son of a Montreal musician. (See also MUSIC, POPULAR.) (R. L. Fy.)

Music, Popular. Ironically enough, it was a Polish folk-song, masquerading under the title of "Beer Barrel Polka," that led the American bit parade of 1939. This Shapiro-Bernstein publication sold a total of about 600,000 copies of sheet-music during the year, the first popular song to pass the half-million mark in some time.

Second place was taken by a late arrival, "South of the Border," a reversion to the geographical nostalgias that were once so popular in Tin Pan Alley. In third place was "Deep Purple," whose melancholy strains were evolved from an instrumental piece.

In addition to these three leaders, a dozen hit songs were grouped by *Variety* in the "first fifteen" of popularity as measured by actual sales. These 12 were: "Umbrella Man," "Deep in a Dream," "Penny Serenade," "Little Sir Echo," "Three Little Fishes," "Wishing," "Sunrise Serenade," "Over the Rainbow," "Man with the Mandolin," "Scatterbrain," "Blue Orchids," and "My Prayer." Close to the sacred circle were four more hits, "And the Angels Sing," "Jeepers Creepers," "Stairway to the Stars," and "Rancho Grande."

The year showed a significant continuation of the tendency to make popular songs out of established classics, with frank credit to the source of the melody. Larry Clinton, who had started the cycle with "My Reverie" (after Debussy), again scored heavily when he turned the best theme of Tchaikowsky's *Romeo and Juliet* Fantasie-Overture into "Our Love." André Kostelanetz then capitalized the slow melody from the same composer's fifth symphony as "Moon Love." There was also an echo of Ravel's *Pavane* in "The Lamp is Low," while Raymond Scott made household music out of Mozart's piano sonata in C by simply giving it the title "In an Eighteenth Century Drawing Room."

At the close of 1939 Abe Olman's "Oh, Johnny," dating back to 1917, was riding high once more, proving that a good tune will assert its vitality in the face of the strongest competition. Hawaiian music maintained its vogue, with Ray Kinney and Clara Inter ("Hilo Hattie") as its chief interpreters, and the "swing" treatment of popular melodies showed no signs of weakening, with Glenn Miller's new band added to the established groups under the direction of Benny Goodman, Artie Shaw, Boh Crosby, and other leaders in the improvisational style.

The battle between the American Society of Composers, Authors

and Publishers (ASCAP) and the entertainment interests, particularly radio, was bitterly fought out in the courts, with the creators of America's commercially profitable music winning signal victories in the upholding of the Federal Copyright Law.

One result of this running battle was an increased interest in the work of obscure songwriters and musical amateurs, whose opportunities for performance and publication became greater than ever before. In this development of new talents, the most practical service was given by the New York clearing-house, The Songmart.

Statistics of the music business, however, showed that the traditional methods of publishing and exploiting popular songs were too firmly grounded to be shaken by legal attacks or undermined by novices. The most successful of America's popular songs continue to be produced by a comparatively small group of skilled workmen, to whose efforts the public insists upon giving a just reward. (See also MUSIC.) (S. SP.)

Mussolini, Benito (1883–), Italian statesman and dictator, played a large part in European politics during 1938 and 1939. For his earlier career, see *Encyclopædia Britannica*, vol. 16, pp. 28–31. On Sept. 29, 1938, he formed one of the "Big Four" at Munich which, at 1.30 A.M. on the 30th, reached agreement. His last act of international importance before the close of 1938 was his denunciation, on December 17, of the Franco-Italian agreement of Jan. 1935 regarding Tunisia.

The Italian role in international politics of 1939 began with the two-day visit of Neville Chamberlain to Mussolini in Rome, January 10–12. Nothing developed from this meeting. The rest of the year Il Duce blew hot and cold on the question of peace. On March 26 he suggested that France should begin discussion of the "problems" of Tunisia, Jibuti and the Suez canal, but when Daladier declined, Mussolini did not press his point. On April 7 he ordered the invasion of Albania; on April 20 he accused President Roosevelt of committing "geographical errors" by asking Hitler to refrain from further aggression, but he tempered this speech by calling attention to the Rome fair of 1942 as an indication of Italy's will for peace. On May 14 he delivered a very conciliatory speech at Turin, declaring that "recourse to the sword is not necessary"; and eight days later Italy signed a 10-year treaty of military alliance with Germany. At the approach of war Mussolini redoubled his efforts for peace and as late as September 2 he tried to call a five-power conference. When the war did break out he declared in an official communiqué that Italy would "take no initiative whatever." This alternate sword-rattling and peace-courting revived the old charges of opportunism directed at Mussolini, but in some quarters he was publicly thanked for his peaceful endeavours, notably by Chamberlain in the House of Commons on September 1. Naismith, James (1861–1939), U.S. physical director and inventor of the game of basketball. He was born at Almonte, Ont., Canada, November 6 and received his education at McGill university, Presbyterian college at Montreal, and the Y.M.C.A. college at Springfield, Mass. It was at the latter institution, where he was physical director after his graduation, that he originated and introduced basketball in 1891. The game was originally called Naismith ball and was played with two peach baskets and a soccer ball. Naismith was later director of physical education at the Y.M.C.A. college in Denver (1895–1898) and at the University of Kansas (1898–1937). He died November 28 at Lawrence, Kan.

National Academy of Sciences. The National Academy of Sciences was incorporated by Act of Congress in 1863 for the purpose of investigating, examining, experimenting and reporting upon any subject of science or art whenever called upon by any department of the United States Government. Membership is by election, in recognition of outstanding achievements in scientific research, and is limited to 350 active members and 50 foreign associates. Members must be citizens of the United States.

At the annual meeting held in Washington, D.C., April 24–26, 1939, 15 new members were elected, as follows: Gregory Breit, Detlev Wulf Bronk, William Bosworth Castle, Frederick Gardner Cottrell, Frederick Parker Gay, Albert Baird Hastings, Vladimir Nikolaevich Ipatieff, Merkel Henry Jacobs, Zay Jeffries, Donald Forsha Jones, George Bogdan Kistiakowsky, Warren Judson Mead, Oscar Riddle, Adolph Hans Schultz, Philip Edward Smith. Three additional foreign associates were elected: Sir Joseph Barcroft, of Cambridge, England; Sir William Bragg, of London; and F. A. Vening Meinesz, of Utrecht, The Netherlands.

Four gold medals were presented at the dinner on April 25, 1939: The Agassiz Medal for Oceanography, to Harald Ulrik Sverdrup, of the Scripps Institution of Oceanography, of the University of California, for his personal oceanographic explorations in Arctic regions and his numerous contributions to physical oceanography and the interrelations between the sea and the atmosphere; the Daniel Giraud Elliot Medal for 1933 and an accompanying honorarium of \$200 to Richard Swann Lull, of the Peabody Museum of Natural History, Yale university, in recognition of his work entitled: "A Revision of the Ceratopsia or Horned Dinosaurs"; the Daniel Giraud Elliot Medal for 1934 and an accompanying honorarium of \$200 to Theophilus Shickel Painter, of the University of Texas, in recognition of his work on the chromosomes of the salivary glands in *Drosophila* in relation to the problems of mutation and genetics, published in *Genetics* and in the *Journal of Heredity* in 1934; and the John J. Carty Medal and an accompanying honorarium of \$3,000 to Sir William Bragg, of the Royal Institution, London, England, in recognition of his fundamental work in X-ray crystal analysis. Sir William Bragg had come to the United States primarily for the purpose of delivering the Pilgrim Trust Lecture before the Academy. The Pilgrim Trust Lecture-ship was established in 1937, to continue for six years under a plan of operation adopted by the Royal Society of London and the National Academy of Sciences, supported through the generosity of the Pilgrim Trust which was set up in Great Britain by Edward S. Harkness, an American. Under this plan, in alternate years the Royal Society of London will invite a distinguished American scientist to lecture before the Society, and in the intervening years the National Academy of Sciences will invite a distinguished British scientist to lecture before the Academy. The first Pilgrim Trust Lecture was given in London on Dec. 8, 1938, by Dr. Irving Langmuir of the Research Laboratory of the General Electric Company. The subject of Sir William Bragg's lecture before the Academy on April 24, 1939, was "History in the Archives of The Royal Society." The autumn meeting was held at Brown university, Providence, Rhode Island, October 23–25, 1939. The Academy publishes an annual report, biographical memoirs of deceased members, scientific memoirs, and monthly *Proceedings*.

The officers of the Academy are: Frank B. Jewett, president; Arthur L. Day, vice president; L. J. Henderson, foreign secretary; F. E. Wright, home secretary; Arthur Keith, treasurer; Paul Brockett, executive secretary. The Academy building is at 2101 Constitution avenue, Washington, D.C.

National Debts. Although public debt figures would appear to be precise and meaningful measures comparable from one country to another, there are many limiting factors in such comparisons. Figures are generally available for only national debt, whereas the relative importance of the independent obligations of lesser political units no doubt varies considerably among different countries. In the United States the debt of States, cities, counties, and other minor civil divisions was approximately \$20,000,000,000 in 1939, about half as large as the Federal public debt. The figures as presented herein are confined to national debt because of the limited source material on the debt of local agencies for nearly all countries. Although the figures given in the accompanying table are taken from the same source and have been reduced in so far as possible to a common definition, the official reports on which they are based are not equally reliable, there being a tendency in some countries toward concealment in order to indicate understatements of the debt total. Because of limited comparability of data taken from primary sources, the League of Nations' *Statistical Yearbook* was used and the latest figures from this source are for some date in 1938.

The data are available in original form only in the local currency of each country and, therefore, must be converted into a common unit of measurement. This conversion into dollars has been made through the use of exchange rates prevailing as of the date for which the debt figures are given. Exchange rates are not satisfactory in many instances because of the artificial controls and barriers imposed on foreign exchange in different countries. For instance, the debt of France as measured in dollars has dropped sharply since 1936 because of the decline in the dollar exchange rates of the franc. Even when the conversion into a single monetary unit can be achieved satisfactorily, the matter of population is a factor and the figures must be converted to a per capita basis. Beyond these adjustments there are many other elements which should be considered, such as the value of Government property, the scope of Government functions, the national income, the interest and service costs of the debt, and costs of living. For most of these factors there is little information available.

By far the largest aggregate national debts are owed by Great Britain and the United States, the former being slightly under \$39,000,000,000, and the latter slightly over \$41,000,000,000. These totals are several times as large as the debts of France, Germany, or Italy. When the figures are converted to a per capita basis, the national debt of Great Britain is substantially more than double that of any other country except Australia and New Zealand whose per capita debts are not far below the Great Britain figure. The averages of \$819 per person in Great Britain, \$727 in Australia, and \$724 in New Zealand compare with \$316 in the United States, \$315 in Canada, and \$277 in France. Other countries whose per capita national debts exceed \$200 include the Netherlands, Belgium, and Italy. The latest figure available for Italy is for 1935. No doubt the expanded military program of Italy and its conquest of Ethiopia have greatly enlarged the Italian national debt in recent years.

Comparisons between the national debt and the national income is difficult because the figures are not always available for the same years, and the income figures are even less dependable than are the debt figures. However, some generalizations can be made. It appears that for Great Britain and Australia the national debt

is from one-and-one-half to two times as large as the national income, and in Italy the national debt is more than twice the national income. Also, in France, Belgium, and Greece the national debt exceeds the national income.

In all other countries the national income is larger than the national debt, the ratios of debt to income varying from about three-fourths in Canada, Japan, Spain, the Netherlands, and the United States to less than one-half in Argentina, Denmark, Finland, Germany, Hungary, and Sweden.

The national debt of the United States has only been of substantial size since the World War. Throughout the early part of the 19th century the gross debt never exceeded \$100,000,000. It rose to \$2,678,000,000, or a per capita total of \$77 in 1865, as a result of the Civil War. Thereafter the debt tended downward through the balance of the century and varied only slightly in the early part of the 20th century. In 1916 the United States public debt was \$1,225,000,000 or \$11.96 per person. By 1919 the World War brought about an increase in the national debt to \$25,482,000,000 or \$240 per person. Throughout the '20s there was a decrease, the low point being recorded in 1930 when the obligations of the United States totalled \$16,185,000,000. Deficits in every year since 1930 have brought the level above \$40,000,000,000 at the close of 1939.

Somewhat similar to the trend in the United States, the national debt of Great Britain was much smaller prior to the World War than subsequent thereto. Throughout the entire last quarter of the 19th century, the total national debt varied from approximately £700,000,000 to £800,000,000. Little variation occurred during the first 15 years of the 20th century, the total tending slightly downward. In 1914 the total debt was £651,000,000; by 1920 this had risen to £7,829,000,000. This increase was somewhat larger than the rise in national debt in the United States

as a result of the World War. Throughout the '20s there was no decline in the British national debt, whereas the total in the United States fell off substantially. However, in recent years the national debt of Great Britain has shown little change whereas the United States debt has more than doubled since 1930.

With the outbreak of the war in Europe in Sept. 1939 there appeared immediate evidence of further mounting of national debt in the United Kingdom and elsewhere on the continent. The large debts of the World War had, in most countries, continued to be unliquidated, except in some instances by default, before preparations for and participations in new wars brought new debts. The conflicts in China, Spain and Ethiopia were costly but appear minor in comparison with the prospective cost and new debts of the war of the major European powers which began in Sept. 1939. (See also GOVERNMENT EXPENDITURES; GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.) (R. R. N.)

National Defense Power Committee: see PUBLIC UTILITIES.

National Education Association of the United States, organized in Philadelphia in 1857, "is dedicated to the upbuilding of democratic civilization and supported by the loyal co-operation of the teachers of the United States to advance the interests of the teaching profession, promote the welfare of children, and foster the education of all the people." It has a membership of over 200,000 and is governed by a representative assembly composed of delegates from State, territorial, and local units. Its official organ is *The Journal* of the NEA issued to all members monthly except during June, July and August. Special branches of education are represented by 27 departments such as school administrators, teachers colleges, elementary principals, secondary principals, classroom teachers, adult education, and the like.

The Association's winter convention was held in Cleveland, February 25 to March 2, 1939, around the theme "The Foundations of American Education;" its general convention in San Francisco, July 2-7, 1939, around the theme "The Responsibilities of our Profession." The 1940 conventions are to be at St. Louis in February and Milwaukee in July. Leading activities of the Association during 1939 were the Centennial of Teacher Education; the development of Future Teachers of America; the work of the Educational Policies Commission; and continuing efforts on behalf of teacher welfare and Federal aid for general education. American Education Week, which the Association sponsored in co-operation with other groups November 6-12 around the theme "Education for Tomorrow's America" brought more than 8,000,000 visitors into the schools. Association headquarters are in its own building at 1201 Sixteenth Street Northwest, Washington, D.C.; president for 1939-40, Miss Amy Hinrichs, principal of the Audubon School in New Orleans, La.; executive secretary, Willard E. Givens. (See also ACADEMIC FREEDOM; EDUCATION.) (J. E. Mo.)

National Gallery of Art: see SMITHSONIAN INSTITUTION.

National Geographic Society. Organized in 1888 "for the increase and diffusion of geographic knowledge," and since 1899 directed by Gilbert Grosvenor, the National Geographic Society has completed over a half-century of noteworthy achievement. It had in 1939 a mem-

bership of 1,100,000 in all parts of the world—the largest educational institution of our time. In addition to the editorial and photographic surveys constantly being made, the society has sponsored more than 100 scientific expeditions, some of which required years of field work to achieve their objectives. Narratives of these expeditions and other explorations, together with photographic surveys, are presented to the society's membership through the pages of the *National Geographic Magazine*. To form a pictorial record of world geography, the society has assembled a gallery of some 300,000 photographs, over 25,000 of which are in natural colour. During 1939 the society in co-operation with the Smithsonian Institution sent an archaeological expedition to Veracruz, Mexico. M. W. Stirling, leader of the party, reported on Jan. 16, 1939, the discovery of the oldest dated work of man yet uncovered in the Americas, a Mayan stele bearing a date equivalent to Nov. 4, 291 B.C. Dr. Stirling's account of the find was published in the August issue of the *National Geographic Magazine*. Another outstanding record of archaeological achievement was published in the May 1939 issue as "Frozen Fragments of American History." This is an account of the National Geographic Society-Smithsonian Institution Expedition to Bering sea which, under the leadership of Henry B. Collins, Jr., found the first traces in Alaska of the old Eskimo "Tbule" culture.

The National Geographic Society-Cornell university three-year study of auroras, under Dr. C. W. Gartlein, clocked and measured the aurora borealis on the night of Aug. 11, 1939. Photographs in colour and motion pictures were made of these lights which were the most spectacular seen in the northern United States and Canada in ten years. Charles Bittering, N.A., completed his paintings of solar phenomena for which he made studies during the National Geographic Society-U.S. Navy Solar Eclipse Expedition to Canton island in 1937. These paintings were reproduced in the July 1939 issue of the *National Geographic Magazine* to accompany F. Barrows Colton's review of recent astronomical achievements.

Mr. and Mrs. Wendell Chapman conducted an expedition which photographed in colour big game animals in their native habitats from Arizona to Canada; these pictures were shown in the July 1939 issue of the *National Geographic Magazine*. J. D. Whiting made a survey of the ancient cone dwellings in Cappadocia, Turkey; the first pictures in colour of these early Christian retreats were published in December. Dr. Maynard Owen Williams, W. Robert Moore, and Luis Marden made an eight-months' survey of South America for the society. The hostilities in Europe necessitated the postponement of the year-long expedition during which the society, in co-operation with the University of Virginia and the U.S. Coast Guard, planned to survey an area of 4,500,000 sq.mi. in the Central and South Pacific ocean.

In addition to its magazine the society has published a series of nature books. The most recent is *The Book of Fishes*, edited by Dr. John Oliver La Gorce, the most comprehensive, full-colour presentation yet published of the better known species of North American inland and coastal waters. The two-volume *Book of Birds*, edited by Dr. Gilbert Grosvenor and Dr. Alexander Wetmore, in this series is the first book to be published portraying in full-colour illustrations all the known species of birds on the North American continent, north of Mexico. The scientific monograph entitled "National Geographic Society-U.S. Navy Solar Eclipse Expedition of 1937 to Canton Island" was published in 1939 as one of the society's series of *Contributed Technical Papers*. (G. Gr.)

National Guard. The mobilization plans of the Army of the United States call for the National Guard to take the field at peace strength immediately upon the call or

order of the President. Eighteen infantry divisions are to mobilize at once concurrently with four of the Regular Army. One cavalry division and numerous other non-divisional units are also to mobilize without delay as parts of the Initial Protective Force.

The National Guard is the largest of the three components of the Army with strength of approximately 205,000. During the year, Congress authorized a substantial increase in the air corps units of the Guard. The National Guard appropriation for the year ending June 30, 1939, included \$14,024,472 for modern arms and equipment.

On June 30 there were 14,667 commissioned and warrant officers in the active and 674 in the inactive National Guard. Also, 1,602 enlisted men of the active National Guard held commissions in the National Guard of the United States which they would fill immediately upon mobilization. It is planned to increase this last category to approximately 12,000.

In Aug. 1939, approximately 54,000 officers and enlisted men of the National Guard took the field for extensive manoeuvres in the First Army Area at Plattsburg, N.Y., and Manassas, Va. These manoeuvres brought out the fine state of training and esprit of the National Guard.

During 1939, 421 members of the National Guard graduated from Regular Army schools. There were also 33,524 enrolled in the Army extension courses of these schools. Regular Army instructors on full duty with the National Guard numbered 463. The units of the National Guard are now distributed at some 2,200 home stations throughout the 48 States, the District of Columbia, Puerto Rico and the Territory of Hawaii. The organizations and officers of the active National Guard are listed in the Government publication: *Official National Guard Register*. (See also ARMIES OF THE WORLD.) (A. H. BL.)

National Health Program: see DENTISTRY; SOCIALIZED MEDICINE.

National Income. In 1939 the national income in the United States turned upward again after recording a sharp decline in the previous year. The drop in 1938 had come after five successive annual gains. Thus, the national income increased in six of the seven years from 1933 to 1939, inclusive, with the 1939 total of \$68,500,000,000 representing a 70% increase over the \$40,000,000,000 level of 1932. The \$4,500,000,000 increase over the 1938 total of \$64,000,000,000 represents a considerable advance but the dollar national income in 1939 was still more than \$3,000,000,000 below the recovery peak of 1937 and some \$14,000,000,000 under the 1929 record total.

Within the year 1939, economic activity drifted moderately downward during the early months of the year and then turned upward early in the summer. The rise exhibited added vigour early in September after the initiation of hostilities in Europe and the gains were particularly large in the final months of the year. According to the monthly figures on income payments to individuals, as compiled by the United States Department of Commerce, the gain in the final quarter of 1939 over the comparable period of 1938 was \$1,250,000,000, whereas the increase in the first three months of 1939 over the same months of the previous year was \$500,000,000.

Income of the United States was higher in each month of 1939 than in the corresponding month of 1938.

In its official reports, the Department of Commerce defines the national income as the net value of all goods and services produced within a given year. It includes not only the value of the production of such physical commodities as food, houses, roads and industrial equipment, but also the value of intangible services such as those created by hotels, laundries, theatres and telephone

companies. It is the most comprehensive measure of economic activity now available. When everyone is employed and productive capacity is being effectively utilized, the national income is high and general prosperity prevails. On the other hand, when the national income falls, there is unemployment, idle plant capacity and depression.

National income is arrived at by adding together the net value of what each industry produces. The contribution of each industry to the national income equals the gross value of its product, less the value of the wear and tear on its plant and equipment and the value of raw materials it consumed during the year. By making deductions for all raw materials used, all duplication is eliminated.

With but few exceptions, present estimates of the national income are confined primarily to the value of those goods and services which are produced for sale in the market. Goods and services produced within the home for domestic consumption are not included. Thus, the value of the housewife's services in the form of cooking, cleaning and caring for the family is not counted. However, when such services are performed by a servant, their value is reflected in the servant's wages, which are included. Also, personal services performed by individuals for themselves such as shaving and washing one's own car are not included. On the other hand, if similar services are performed by the barber shop or the garage, they are incorporated in the figures. There is no doubt that the value of economic activities performed within the home add greatly to the general well-being but there is no basis for satisfactorily evaluating the yield from these efforts.

Price Influence.—When the national income rises and falls, the magnitudes of the changes do not satisfactorily indicate changes in the quantities of goods and services being produced. The national income is measured in terms of dollars and the buying power or the value of the dollar itself changes from time to time. This is clearly illustrated in comparing the national income in 1939 with the total for 1929.

In 1939, the total of \$68,500,000,000 was more than one-sixth below the 1929 national income of \$82,700,000,000. This does not mean that the quantity of goods and services produced in 1939 was one-sixth below 1929, because prices were lower in 1939 than in 1929. In fact, relative to 1929 the national income in 1939 was 83%, the cost of living of urban wage earners was 82%, and the United States Bureau of Labor Statistics wholesale price index was 81%. These figures appear to indicate that "real" income in 1939 was slightly higher than in 1929. The price series quoted are not truly representative of all prices and therefore do not lend themselves to such precise comparisons, but it is obvious that the output of goods and services in 1939 was little different from the record pre-depression levels. It also appears probable that the "real" national income in 1939 was approximately equal to that of 1937.

Average prices for the year 1939 as a whole were slightly under 1938 so that the \$4,500,000,000, or 7%, increase in the national income in 1939 was entirely accounted for by an enlarged production of commodities and services. The rise in real income in 1939 probably was larger than in any other year during the past decade with the exception of 1936. This evidence is substantiated by the rise in nearly all available indexes of physical production.

Industrial Source.—The contribution of each industry to the national income is a valuable measure of its relative importance in the total output of the nation, but is not always related to indispensability of the industry.

Some industries, like mining, contribute only a very small proportion to the national income but are highly essential segments of the economy.

In the accompanying table data are presented showing the net value of product or the contributions of each of the major indus-

tries to the national income in the United States. These data are significant indicators of the industrial character of a nation. For instance, in 1929 the commodity producing industries (agriculture, mining, manufacturing and construction) contributed approximately 40% of the national income. The commodity handling industries, including transportation, trade and the public utilities accounted for about one-fourth of the national income the remaining third having been contributed by the service creating industries such as Government, finance and service proper. Available data over a long period of years indicate a gradual decline in the relative importance of the commodity producing industries and a relative rise in the importance of the service industries in the United States. This is to be expected as an economy becomes more mature.

The substantially greater fluctuations in the commodity industries are revealed by the magnitude of the declines from 1929 to 1932, and again from 1937 to 1938 in these industries as compared with the service industries. The difference is particularly marked in 1938, for in that year the commodity industries which in 1937 contributed about one-third of the national income, accounted for more than three-quarters of the drop from 1937. As would be expected, the recoveries in 1932 and 1937 and again in 1939 were largest in these commodity industries. Construction was an exception with the recovery in this industry after 1932 lagging far behind the improvement in other industries.

National Parks and Monuments. In two-thirds of a century, a system of national parks and monuments undreamed of a century ago in any political economy, has been established and developed in the United States. The Yellowstone, the first national park, was established in March 1872. On Dec. 31, 1939, there were 155 separate areas in the national park and monument system of the United States, with a total area of 20,859,891 acres. Twenty-five of these areas are national parks, areas reserved by the Congress because

of their superlative scenery or some historic or scientific feature of outstanding national interest. Eighty are national monuments, areas established by presidential proclamation under authority of the Congress because of historic, prehistoric, or scientific interest of national calibre.

In addition there are four national historical parks, 11 national military parks, seven battlefield sites, eight national memorials of various types, four national historic sites, one national recreational area, 11 national military cemeteries, three national parkways, and the park system of the national capital, consisting of over 700 separate units in and around Washington, D.C.

Through Congressional action two national parks primarily of historical value were given new status. The Abraham Lincoln National Park, Kentucky, became a national historical park and Fort McHenry National Park, Maryland, a national monument. The Chalmette National monument, Louisiana, became the Chalmette National Historical Park.

By presidential proclamation the following new national monuments were established: Homestead National Monument of America (Nebraska), including all of the homestead of Daniel Freeman who filed the first claim under the Homestead Law signed by President Lincoln in 1862; Badlands National Monument (South Dakota), containing over 150,000 mi. of the most important "badland" geological features in the world; Santa Rosa Island National Monument (Florida), a long narrow strip of

white sand forming a barrier island off the Gulf coast of Florida and illustrating in an outstanding manner natural processes by which much of the shoreline of the continent has been formed; and Tuzigoot National Monument (Arizona), with interesting prehistoric ruins.

Other interesting additions to the Federal park system were Federal Hall Memorial and the Philadelphia Customhouse National Historic Site, established by Secretary of the Interior Harold L. Ickes under authority of the Historic Sites Act.

New York city's old subtreasury building, itself of historic interest, stands on the site of old Federal Hall, where George Washington took the oath of office as President of the United States; where the Declaration of Independence was read to the populace July 18, 1776; where the first 12 amendments to the Constitution (10 of them forming the Bill of Rights) were adopted—among many epoch-making events in American history.

The Philadelphia Customs House, over 100 years old, was built to house the Second Bank of the United States. When the fiscal system of the Federal Government was changed, the bank became the Second Bank of the United States of Pennsylvania and continued in operation until 1841, when it was closed as a result of the panic of 1837. Shortly afterwards it was occupied by the Customs service.

The Skyline drive, throughout the length of the Shenandoah National Park, was completed and opened to travel. Excellent progress also was made on the Blue Ridge parkway, to connect Virginia's Shenandoah Park with the Great Smoky Mountains National Park in North Carolina and Tennessee. One hundred miles of the parkway was opened to travel. Interesting progress was made also on the Natchez Trace, following generally the route of the historic highway between Natchez, Miss. and Nashville, Tenn.

The Great Smoky Mountains National Park attained full status. International complications have held in abeyance plans for its dedication by the President. The various areas of the Federal park system were visited by 15,454,367 persons during the year 1939.

Natural Gas. Production of natural gas in the United States suffered only a comparatively small reduction during the depression years, dropping from 1,943,000,000,000 cu.ft. in 1930 to 1,556,000,000,000 in 1933, and recovering to approximately the former level in 1935; in 1938 production declined 5% to 2,295,600,000,000 cu.ft., of which 29% was used in the field, 50% for industrial and 21% for domestic and commercial consumption. The largest item of industrial use is the production of carbon black, which took 14% of the total output. Production in Canada increased slightly in 1938, to 33,400,000,000 cu.ft., and preliminary figures indicate a further increase in 1939.

Navicert System: *see* NEUTRALITY.

Navies of the World. One of the results of the war which broke out on Sept. 3, 1939, was to stimulate the construction of new warships, not only in the countries involved, but in others with interests liable to be affected. By the end of the year there were no fewer than 33 battleships building or about to be begun, of which nine were British, eight American, four Japanese, four French, two Italian, four German, and two Russian. In the case of four British, two American, four Japanese and possibly two German, the displacement is between 40,000 and 45,000 tons. The remaining 21 ships are all to be of 35,000 tons, in accordance with the original limitation imposed by the London Naval Treaty of 1936, which was expanded by agreement in 1938 to 45,000 tons.

None of the various designs provides for a speed of less than 28 knots, and in the majority of cases the figure exceeds 30 knots. Other features common to all are absence of torpedo tubes, extensive protection against plunging fire or air bombing, a plentiful anti-aircraft armament, and the inclusion of seaplanes and catapults in the equipment. General similarity is inevitable in ships whose maximum displacement is limited, giving little latitude for innovations if adequate defensive power, protection, speed, and seakeeping qualities are to be ensured. Considerable variation exists as regards the calibre of the main armament. British 35,000 ton battleships are to be armed with ten 14-in. guns, and the 40,000 tonners with 16-inch. American, Japanese and Russian battleships are all built to mount nine 16-in., while the French, Germans and Italians have preferred either eight or nine 15-inch. In range and accuracy there is believed to be little to choose between the three calibres, the main difference being the weight of the gun and its mounting, and of the projectile that it fires. With the exception of Italy, whose naval staff regard such vessels as superfluous in view of the country's geographical position, all these powers are building aircraft carriers, varying in displacement from 10,050 to 23,000 tons. A typical example of these aircraft carriers, which was completed in 1938, is the British "Ark Royal," of 22,000 tons, with a speed of 31 knots. She is armed with 16 dual-purpose guns of 4.5-in. calibre, and can operate 60 aircraft,

though her spacious hangars, arranged on two decks, could undoubtedly accommodate many more than this.

Cruisers have hitherto been limited by treaty to a displacement of 8,000 tons, and a maximum gun calibre of 6.1-in., but this does not apply to Japan, which was not a party to the 1936 London Treaty. There have been rumours that battle cruisers of about 15,000 tons are being built by that country, and one is even reported to have been launched during 1939; but otherwise there is no evidence that 8,000 tons does not mark the limit of Japanese cruiser displacement. Destroyers built in recent years are remarkable for their size, many of those building for the British Fleet being over 1,900 tons displacement. So far the United States has built none beyond 1,850 tons, but Japan's current program includes a dozen of about 2,000 tons. France is building two types, one of about 2,900 tons, the other of under 1,800 tons. Italy has not gone beyond 1,729 tons in destroyers, but has built a dozen cruisers of 3,362 tons, obviously designed to repel destroyer attacks.

Germany's biggest destroyers are of 1,811 tons, but Russia has completed several of about 2,900 tons.

Submarines are being built in very large numbers. In the British and American Navies, under-water craft building or on order at the end of 1939 numbered 14 and 19 respectively. Japan has at least a dozen under construction; France 24; Italy 16; and Germany an uncertain but undoubtedly large number. Russia, which is believed to possess more submarines than any other nation, has published no figures, but 20 is a conservative estimate of the number in hand.

British Naval Strength.—When the war with Germany began, active steps were in progress for the replacement of the high proportion of out-of-date ships which resulted from the restrictions imposed by the Naval Treaties of 1922 and 1930. Of the new battleships under construction, four were understood to have been launched by the end of 1939, and it was hoped to complete one, if not two, by the end of 1940. Good progress had also been made with other categories of new warships.

At the end of 1939 the British Navy comprised the following warships: 11 battleships; 3 battle cruisers; 15 heavy cruisers mounting 8-in. guns; 43 cruisers with 6-in. guns; 6 anti-aircraft ships (ex-cruisers); 1 minelayer; 5 first line aircraft carriers; 181 destroyers; 58 submarines; 51 escort vessels; 44 minesweepers; 8 patrol vessels; 3 aircraft tenders; 2 netlayers; 20 river gunboats; 6 coastal minelayers; over 25 motor torpedo boats; and 3 monitors. At the outbreak of war there were under construction or authorized (in many instances as replacements): 9 battleships; 23 cruisers; 4 minelayers; 6 aircraft carriers; 18 destroyers; 14 submarines; 26 escort vessels; 20 minesweepers; 3 patrol vessels; 2 river gunboats; and 22 motor torpedo boats. A supplementary program, passed shortly before war began, authorized the construction or purchase of a large number of small craft, mainly trawlers and patrol vessels of the whale-catcher type. Undoubtedly many more new ships have been begun since the outbreak of war, but particulars of these have not been published.

One of the first steps taken by the British Government on the outbreak of war was to give notice of suspension of all its obligations under the London Naval Treaty of 1936, and under the Naval Agreements with Russia and Poland, thus giving all the parties to these Treaties freedom from the restrictions as to displacement and gun calibre placed on the various categories of warships by the Conventions in question.

The total personnel provided for in the 1939 Navy Estimates was 133,000, just 20,000 less than at the outbreak of the World War in 1914.

Naval forces of the Dominions, including Royal Indian, Royal Australian, and Royal Canadian Navies and the New Zealand

Division, are included in the above figures, so far as material is concerned, but not their personnel, which amounts to over 10,000 reserves. There are also reserves of personnel in other British overseas territories, such as Newfoundland, Kenya, South Africa, Hongkong, and the Straits Settlements.

United States Naval Strength.—Large increases in the numbers of all classes of warships had been approved up to 1939, when proposals for additional construction were being brought forward. The total strength at the end of that year included 15 battleships; 18 heavy cruisers with 8-in. guns; 19 light cruisers with 6-in. guns; 5 aircraft carriers; 221 destroyers; 94 submarines; 10 escort vessels and gunboats; 23 patrol vessels; 5 aircraft tenders; 8 light minelayers; and 41 minesweepers. Under construction or about to be ordered were 8 battleships; 6 cruisers; 2 aircraft carriers; 29 destroyers; 19 submarines; 6 aircraft tenders; 1 minelayer; 2 minesweepers; 3 motor patrol vessels; and 6 motor torpedo boats. The total personnel amounts to 138,903, exclusive of reservists.

Japan.—Though official information concerning the Imperial Japanese Navy is nearly non-existent, it is known that at the end of 1939 the total strength was: 9 battleships, which may have been increased to 10 (if one which was to have been demilitarized has been re-armed as proposed); 6 aircraft carriers; 12 cruisers with 8-in. guns; 27 cruisers with 6-in. or 5.5-in. guns; 5 old cruisers rated as coast defence ships; 122 destroyers; 12 torpedo boats; 63 submarines; 15 submarine chasers; 5 aircraft tenders; 14 minelayers; 18 minesweepers and 11 gunboats. So far as unofficial reports are to be relied upon, the following ships are believed to be building: 4 battleships and possibly two battle cruisers; 6 cruisers; 1 or 2 aircraft carriers; at least 4 destroyers; 12 submarines; and numerous smaller craft. The total personnel when last reported was 107,000, but this may have been increased.

France.—The French Navy possesses (Jan. 1, 1940) 7 battleships; 7 cruisers with 8-in. guns; 11 cruisers with 6-in. or 6.1-in. guns; 1 aircraft carrier; 58 destroyers, of which 32 are of between 2,126 and 2,884 tons displacement; 13 torpedo boats, one of these being of the motor type; 77 submarines; 2 minelayers; 1 netlayer; 1 aircraft tender; 8 escort vessels; 27 patrol vessels; 13 minesweepers; 17 submarine chasers; and 9 river gunboats. There are also two old battleships which have been relegated to training duties. Under construction or about to be laid down are: 4 battleships; 2 aircraft carriers; 3 cruisers; 30 destroyers; 30 motor torpedo boats; 25 submarines; 4 aircraft tenders; 2 escort vessels; 15 minesweepers; and 14 submarine chasers. The total personnel is about 85,000.

Italy.—Italy is the first power to complete any 35,000-ton battleships of modern design. Her strength at the end of 1939 comprised 6 battleships, of which 2 were under reconstruction; 7 cruisers mounting 8-in. guns; 14 cruisers with 5.9-in. or 6-in. guns; 1 obsolete cruiser, of value only for coast defence; 61 destroyers; 73 torpedo boats; 72 motor torpedo boats; 105 submarines; 1 escort vessel; 1 aircraft tender; 13 minelayers; 42 minesweepers; and 13 gunboats. There were under construction: 2 battleships; 14 cruisers; 14 or more submarines; and an uncertain number of motor torpedo boats. The personnel numbers about 75,000.

Germany.—German naval strength when the war began included 2 battleships; 3 armoured ships of 10,000 tons, popularly known as "pocket battleships"; 2 cruisers with 8-in. guns; 6 cruisers with 6-in. guns; 22 destroyers; 12 torpedo boats; 20 motor torpedo boats; 71 submarines; 10 patrol vessels; and 37 minesweepers. Under construction at the same date were four battleships; 2 aircraft carriers; 3 cruisers armed with 8-in. guns; 4 cruisers armed with 6-in. guns; 8 destroyers; 30 torpedo boats; 12 motor torpedo boats; 28 submarines; and 18 minesweepers. Two obsolete battleships, officially rated as training ships, were employed in the attack on Poland. A great many more submarines are believed to have been begun since. The total personnel is uncertain, but unquestionably exceeds 50,000.

U.S.S.R.—Official information concerning the Soviet Fleet is as scarce as in the case of the Imperial Japanese Navy, but the following particulars are believed to be reliable. Completed ships include 3 old battleships; 5 cruisers (excluding obsolete vessels used for training); 33 destroyers; 21 torpedo boats; 130 motor torpedo boats; 150 submarines; and a large number of minelayers and minesweepers. Under construction or about to be begun are: 2 battleships; 2 cruisers; 3 aircraft carriers; 6 destroyers; and about 20 submarines. There are no recent statistics of personnel, but the total is probably between 30,000 and 40,000.

Other European Countries.—Of the smaller naval powers, the one that has taken the most active steps to increase its naval strength is the Netherlands, which has in hand the biggest program of construction in Dutch history. The existing fleet includes 4 cruisers; 8 destroyers; 10 torpedo boats, of which 2 are of the motor type; 23 submarines; 1 gunnery training ship; 3 escort vessels; and 1 old coast defence ship; 11 minelayers; and 15 minesweepers. It is proposed to build 3 battle cruisers, which will be by far the biggest warships ever designed for the Royal Netherlands Navy. There are building or on order 3 cruisers; 4 destroyers; 30 motor torpedo boats; 7 submarines; and 7 escort vessels. Particular concern is felt in the Netherlands for the safety of the vast Dutch possessions in the East Indies, for the protection of which the existing fleet is thought to be insufficient.

In the Scandinavian countries there is great uneasiness in regard to the international situation. It is plain that the tendency of Germany and Russia to expand at the expense of their immediate neighbours is causing concern to those on the opposite side of the Baltic. Sweden (Jan. 1, 1940) possesses 2 cruisers; 8 coast defence ships; 8 destroyers; 15 torpedo boats, 2 of which are of the motor type; 16 submarines; and 6 minesweepers. There are under construction or to be laid down shortly: 2 coast defence ships; 2 destroyers; 4 motor torpedo boats; 5 submarines; and 10 minesweepers.

The Royal Norwegian Navy comprises 4 coast defence ships; 20 torpedo boats; 9 submarines; 4 minelayers; and 11 minesweepers. Under construction are 2 destroyers; 3 torpedo boats; 8 motor torpedo boats; and 2 submarines.

Denmark, whose fleet (Jan. 1, 1940) comprises 2 coast defence ships; 17

torpedo boats; 10 submarines; and 3 minesweepers, is building 2 torpedo boats; 2 submarines and a minelayer, part of the most extensive program that has been put in hand for a long time past.

The Finnish Navy, at the time of the Russian invasion, included 2 coast defence ships; 5 submarines; 7 motor torpedo boats; 4 gunboats and a number of small minelayers and minesweepers.

Poland, although her navy sustained severe losses when attacked by Germany, still possesses 3 destroyers, which are now serving with the British Fleet, and 5 submarines. Two more submarines were ordered in France some months ago.

Estonia proposes to build a number of motor torpedo boats, one of which was ordered in England early in 1939. Otherwise her Navy consists of 2 submarines; 1 torpedo boat; 4 minelayers and a number of smaller craft.

Latvia possesses two submarines, 2 minesweepers and 1 gunboat; and Lithuania has a single patrol vessel, which since the German occupation of Memel has had to seek refuge in a Latvian port.

Spain is still engaged in reorganizing her naval forces after the Civil War. There are in service (Jan. 1, 1940) 6 cruisers; 19 destroyers; about 25 torpedo boats; 13 submarines; 4 minelayers; 6 escort vessels; and many smaller craft. The old battleship "Jaime Primo" is still in existence, but is of little fighting value except for coast defence purposes. New ships ordered before the Civil War include two destroyers, 3 submarines and 2 minelayers. Construction of these has doubtless been resumed.

The Portuguese Fleet, as modernized under the present regime, comprises 6 destroyers; 8 escort vessels; 1 torpedo boat; 3 submarines; and 4 gunboats. It had been proposed to order 3 destroyers; 3 submarines; and 6 motor torpedo boats during 1939, but the outbreak of war between the Allies and Germany has held up this program.

Greece possesses 1 old cruiser; 10 destroyers; 13 torpedo boats; 6 submarines; 1 large and 8 small minelayers; and 2 motor torpedo boats. Two destroyers and two motor torpedo boats are under construction, and two submarines are projected.

The Turkish Fleet comprises one old battleship; 4 destroyers; 9 submarines; 2 old cruisers used for training; 3 motor torpedo boats; 3 minelayers; and various smaller craft. Four destroyers; 4 submarines; and 2 minelayers are under construction in British shipyards.

Rumania has 4 destroyers; 1 submarine; 3 old torpedo boats and some minor war vessels. Two submarines and 2 minelayers are building in Rumania, and it is proposed to acquire 3 motor torpedo boats.

The Yugoslav Navy possesses 4 destroyers; 4 submarines; 8 torpedo boats; 10 motor torpedo boats; 1 aircraft tender; 6 minelayers; and an obsolete cruiser, used for training. A destroyer, a patrol vessel and 2 submarines are under construction, but as the last mentioned are building in Germany it is probable that they will be appropriated by that country.

Hungary has 4 armed patrol vessels on the Danube, but, following the annexation of Austria and Czechoslovakia, the river flotillas of these countries have been absorbed into the German Navy.

South America.—Recently several South American states have taken steps to renovate their naval forces.

The Argentine Navy includes 2 old battleships; 3 cruisers; 4 coast defence ships; 16 destroyers; 3 submarines; and 15 patrol vessels. To these will need to be added 2 escort vessels under construction in an Argentine dockyard.

Brazil possesses (Jan. 1, 1940) 2 battleships; 2 cruisers; 1 destroyer; 6 torpedo boats; 4 submarines; and 4 minelayers. Three destroyers and 2 minelayers are to be built in Brazilian yards.

Chile, which in naval efficiency is second to no other country in South America, has been restrained by financial considerations from increasing her fleet, which at present comprises 1 battleship; 3 cruisers; 8 destroyers; and 9 submarines. A program of new construction to include 2 cruisers, 2 submarines and an escort vessel has not yet materialized, with the exception of the last ship, which is being built in Chile.

Peru has undoubtedly been hindered by the instability of her recent Governments from making much progress in the modernization of her Navy. It includes 2 cruisers; 2 destroyers; 4 submarines; and 1 torpedo boat. Similar considerations apply to Ecuador, whose sea force (Jan. 1, 1940) is restricted to a single gunboat.

Colombia has in service 2 destroyers; 2 minesweepers; and some vessels of less importance. Venezuela can muster 5 gunboats, while Uruguay has 3 modern patrol vessels and 2 old gunboats used for training. Paraguay's force comprises 3 river gunboats.

Mexico has 4 modern escort vessels; 2 older vessels of a similar category; 10 small gunboats; and 3 patrol vessels. Cuba has 2 escort vessels, recently reconstructed; 5 gunboats; and 7 patrol vessels. Haiti has 2 small patrol vessels of no fighting value. The Dominican Republic, in addition to an armed transport, has 3 patrol vessels, purchased from the United States Coast Guard. Nicaragua has a patrol vessel acquired from the same source. None of the other Central American republics appears to possess any vessels of importance.

Asia.—In the Far East, the Chinese Navy, for practical purposes, has ceased to exist, though it is possible that a few small craft survive in the upper reaches of the Yangtze. Three or four of the larger vessels of the Chinese Fleet have been repaired and added to the Japanese Navy.

On the other hand the Navy of Thailand, to give Siam its new name, has been completely reorganized as regards its materials and personnel. Most of its new ships have been built in Japan or Italy. There are in service 4 coast defence ships; 1 destroyer; 21 torpedo boats, 9 of which are of the motor type; 4 submarines; 2 escort vessels; 2 minelayers; and sundry smaller craft. Two cruisers are under construction in Italy.

Iran has also developed a small Navy under Italian tutelage. This includes 7 gunboats; 3 motor patrol boats; and 1 or 2 smaller vessels.

Manchoukuo, as a satellite of Japan, has acquired 1 destroyer; 15 gunboats; and 16 patrol vessels. Many of these are understood to be river craft. Iraq has 4 patrol vessels, a yacht and a tug.

With a first class war in progress at sea, developments in naval affairs are likely to be rapid. Those countries with extensive programs of new construction in hand will naturally do their utmost to accelerate them, though difficulty in obtaining materials may cause delay in some cases.

*The German figures are as of Sept. 3, 1939.

For convenience of reference, the table above shows the strength in the principal categories of warships of the navies of the world at the end of 1939. (See also AIR FORCES; ARMIES OF THE WORLD; BLOCKADE; EUROPEAN WAR; MUNITIONS OF WAR; STRATEGIC MINERAL SUPPLIES; SUBMARINE WARFARE; TACTICS IN THE EUROPEAN WAR; UNITED STATES: *History*.) (F. E. McM.)

Nazis: see ANTI-SEMITISM; ARGENTINA; BOHEMIA AND MORAVIA; BRITISH EAST AFRICA; EDUCATION; FASCISM; GERMANY; MINORITIES.

Nebraska, one of the States formed from the Louisiana Purchase; area, 76,808sq.mi.; population, 1930, 1,377,963, estimated July 1, 1937, 1,364,000; capital, Lincoln, 75,933. The largest city is Omaha, 214,006. In 1930, 54.9% of the population was urban; 1,355,702 were white, 13,752 coloured, 1,262,617 native-born and 115,346 foreign-born.

History and Government.—The executive power is vested in the governor and eight other administrative officers. The governor prepares the biennial budget, has a considerable appointing power, and a veto power which extends to items in appropriation bills. The principal State officers for 1939-41 were governor, R. L. Cochran; lieutenant-governor, W. E. Johnson; auditor, Ray Johnson; secretary of State, Harry R. Swanson; treasurer, John Havekost; attorney-general, Walter R. Johnson; superintendent of public instruction, Charles W. Taylor.

The legislative power is vested in a single chamber of 43 members, known as the Senate. Senators are elected for single-member districts on a non-partisan ballot for a term of two years. The lieutenant-governor is the presiding officer, though a speaker acts in his absence. Regular sessions are biennial in the odd-numbered years, though special sessions may be called either by the governor or by two-thirds of the membership.

Education.—Higher education is supported by the State at the University of Nebraska and in four teachers' colleges. The State university consists of ten colleges and three schools of collegiate grade. The total enrolment for 1938-39 exceeded 12,000, of whom more than 9,000 were resident students of collegiate rank. Property and equipment are valued at \$11,700,000 and the biennial appropriation for 1939-41 was \$7,530,270 (including Federal grants). The management of the university is vested in an elec-

tive board of regents. The four teachers' colleges offer collegiate training for four years leading to a bachelor's degree. The total enrolment in 1939 was 4,877 and the faculties numbered 186. Control is vested in a board of seven members. Elementary and secondary education is in the hands of local school districts of which there are now more than 7,000 in the State. Financial support is derived almost wholly from the local tax on property. The total enrolment in 1937 was 300,041 and the number of teachers employed was 17,440. School property was valued at \$84,424,329, school expenditures were \$20,525,000 and school indebtedness amounted to \$30,220,830.

Charities and Corrections.—The dependent, delinquent and defective classes are cared for in 17 institutions under the supervision of the State Board of Control. In addition to the penitentiary and reformatories for men and women, there are industrial schools for boys and girls, hospitals for the blind, the deaf and the feeble-minded, three hospitals for the insane, one home for soldiers and sailors, an orthopaedic hospital and a home for dependent children. The total institutional population in 1939 was 9,103 and the legislative appropriation, \$5,574,989. In addition there is an appropriation to the State assistance fund for the biennium 1939-41 of more than \$14,900,000. This fund is administered by a State assistance director in co-operation with the county boards.

Banking and Finance.—State banks under the supervision of the State banking department numbered 290 on June 30, 1939—a decrease from 415 in 1933. These banks have resources of \$78,555,507. There were also 54 building and loan associations with resources of \$58,946,419 and 161 co-operative credit associations with assets of \$2,452,498. National banks at the same date numbered 136 with resources of \$213,411,000.

The total assessed valuation of the State for tax purposes is \$2,033,302,482. The tax rate for State purposes for 1939 is set at 2.61 mills, which is calculated to produce \$5,344,026. The biennial budget for 1939-41 carried appropriations of \$51,436,114, of which about \$12,500,000 are Federal funds. The chief sources of State revenue, aside from the direct tax on property, are the tax on gasoline, motor vehicle licences, taxes on liquors and miscellaneous fees and licences. There is no State tax on personal or corporate incomes or on sales. The inheritance tax is collected by the counties. The State has no debt, though that of the local subdivisions in 1938 amounted to \$71,000,000. This does not include debts of the Public Power and Irrigation Districts amounting to \$60,000,000.

Agriculture and Manufactures.—Nebraska is an almost purely agricultural State and its chief products are from the soil. Its most valuable products are cereals and livestock. The normal production of corn is nearly 250,000,000bu. and of hogs more than 5,000,000 annually. Other important crops are wheat, oats, hay, potatoes and sugar beets.

The chief industries of the State are connected with the processing of farm products. The meat packing industry of Omaha involves 12 establishments, turning out products valued at \$109,419,614. Next in order of their importance come the processing of milk, flour, feed and mill products; car and car repairing, and such minor industries as confectionery, leather and harness, lumber and millwork and concrete products. In 1937, 24,480 persons were gainfully employed in 1,071 manufacturing establishments and the value of manufactured products was \$282,502,287.

Necrology: see OBITUARIES.

Negroes (American). The civil rights campaign for removal of disabilities of racial discrimination has continued significantly. After the 1938 U.S.

Supreme Court decision, ordering the State of Missouri to admit Lloyd L. Gaines to the University of Missouri Law school or provide equal facilities within the State, a separate law school for Negroes, authorized by the Taylor Bill, has been organized at St. Louis as an extension of the State-supported Lincoln university. This has been widely protested, the school premises picketed, and suit is impending to show the facilities offered unequal and therefore, discriminatory. Other Southern States, much concerned by the implications of the Gaines decision, have been increasing appropriations and educational facilities for Negroes. In Maryland, the State has taken over Morgan college, a private institution, as a State college. A few States are now offering graduate and professional studies, some in co-operation with the faculties of the white State universities, others by extension of the programs and staffs of the Negro State schools. Pressure for full facilities and removal of legal disability still continues in legal and popular protest.

Fourteenth amendment pleas before the liberalized courts seem increasingly successful. The Virginia suit for the equalization of teachers' salaries, brought in Norfolk, Va. was lost and has been appealed, but the Annapolis county (Md.) Mill's Injunction case won a favourable decision and the Maryland authorities were ordered to equalize the pay of white and Negro teachers, and acquiesced.

Similarly, there has been increased participation of Negroes in both labour organization and in campaigns for labour rights. Both in A.F. of L. and C.I.O. organizations, increased recognition and activity of Negro workers took place, especially in the C.I.O. unions, where mixed unions are the rule even in Southern jurisdictions. The Brotherhood of Red Cap Porters won a long-standing salary decision before the Labor Relations Board on mandatory wages instead of gratuities from the travelling public. Labour activity has been intensified by the pressure of the depression, from which Negroes have suffered disproportionate employment losses. Growth of labour consciousness accounts also in part. Acute suffering and unrest among urban Negro workers has only been obviated by the Federal and State relief and remedial employment programs. In the rural districts, the situation has steadily grown worse, so that farm tenant evictions, riots and protests have featured the year; especially in Arkansas, Missouri and Oklahoma, where sharecropper conditions have become matters of national publicity and concern. A significant feature has been the frequent joint organization and action of the white and the Negro sharecroppers, sometimes independently, sometimes under the auspices of the Southern Farm Tenants Union. In the relief retrenchments of both State and Federal funds, Negroes have experienced heavy economic set-backs, due to local discrimination and allowance differentials in certain States of the relief allotments.

Educational and Cultural.—*The Crisis* annual survey of education reported a grand total of 3,467 Negro college and professional graduates, 2,890 of whom were trained in Negro colleges with a total of 25,781 students enrolled. Fourteen doctoral degrees and 32 Rosenwald Fellowship and two Guggenheim Fellowship awards showed steady gains in the upper brackets of research and creative scholarship. In the arts especially noteworthy progress took place not only in music and drama, but in the fine arts. The Baltimore Museum of Art held in March a show, very favourably received, of the work of Negro artists. Marian Anderson, world famous contralto, continued her triumphal career with new public recognition in radio and concert, but was denied the use of Continental Hall in Washington by the D.A.R. Board. This discriminatory decision met nation-wide protest, culminating in resignations from that organization which included that of Mrs. Eleanor Roosevelt. As a protest, an open air concert was held in

Washington Easter Sunday at the Lincoln Memorial, 72,000 persons participating in a record-breaking event under prominent patronage and with an introduction by Secretary of the Interior Ickes July 2, at the annual convention of the National Association for the Advancement of Colored People, Miss Anderson was presented her Spingarn medal awarded by Mrs. Roosevelt, who had previously placed her on the White House recital program honouring the visit of King George and Queen Elizabeth, the British sovereigns. Notable recognition came during 1939 to another singer, Dorothy Maynor, soprano, presented by Serge Koussevitsky in Boston and New York with the Boston Symphony orchestra. In the 25th anniversary concerts of the American Society of Composers, Authors and Publishers at Carnegie Hall, an historical review of Negro music featured one evening, with special tribute to W. C. Handy, composer of the "St. Louis Blues." Symphonic as well as popular music was presented. It was established by Kelly Miller that the author of "Carry Me Back to Ole Virginny" was James Bland, a Negro musician of the late '70s. Geo. W. Carver received one of the three Roosevelt medal awards, for his achievements in scientific horticulture and industrial chemistry.

In drama, notable theatre productions of 1939 were *Mamba's Daughters*, by DuBose Heyward, starring Ethel Waters, *John Henry*, by Roark Bradford starring Paul Robeson, and the Chicago Federal theatre production of a jazz version *Swing Mikado*.

In New York city, Jane Bolin was appointed the first woman court judge by Mayor La Guardia, and Judge Myles Paige, previously appointed to the Criminal Division Court was promoted to the Special Sessions Bench. Kelly Miller, famous sociologist and race publicist, died December 29.

In the field of religion, the unification of the Northern and Southern branches of the Methodist Episcopal churches took place and two Negro bishops were assigned jurisdiction over Negro churches. In the Roman Catholic Church a movement for closer inclusion of Negro communicants in churches and church schools without racial discrimination received great impetus from its approval in the first encyclical of Pope Pius XII, who at his first consistory appointed two Negro missionary bishops. (See also **ILLITERACY**.)

Neoprene: see STANDARDS, NATIONAL BUREAU OF.

Nepal, a kingdom lying between India and Tibet, is now completely independent, but has the closest association with India, both in commerce and in its recruits for the fine Gurkha regiments of the Indian army. The prime minister is by old tradition *de facto* ruler of the State. The British envoy (Col. G. L. Betham) resides at Khatmandu, the capital city (pop. 80,000). On the outbreak of war in Europe the Government of Nepal offered to send 8,000 Gurkhas for the garrisoning of India. (ME.)

Nervous Diseases: see MEDICINE; PSYCHIATRY.

Nervous System. Localization of specific functions residing within discrete areas of the grey cortex of the brain has become more exact since neurosurgeons have, during the course of operations for brain lesions, systematically stimulated the exposed surfaces of the human brain. Valuable data have been derived of practical value in localizing diagnoses.

Penfield and Boldrey have demonstrated that in epileptic patients habitual abnormal patterns of discharge have been conditioned by repeated attacks indicating how important is early adequate anti-convulsant therapy. The field of electroencephalography has been extended and has become of practical value. Focal lesions may be localized by the presence of large slow delta waves recovered from specific areas of the skull. Epileptics of various types may be differentiated by a specific type of wave. Children with behaviour problems and sufferers from dementia praecox may show epileptoid waves indicating a primary disturbance of brain rhythm. Data are emerging which seem to indicate that the personality and even intelligence of an individual may be roughly mirrored in his brain waves. Vitamin B₁ deficiency which at first seemed only causative of beriberi has now been shown to be the most important factor in producing many types of neuritis. The term has been modified to that of neuropathy because only in a circumscribed group of cases is there actual inflammation. Most of the so-called cases of neuritis are degenerations of the peripheral nerves due to vitamin B₁ deficiency. These include the neuritis in alcoholisms, plumbism, diabetes, pregnancy cachexias, etc. Excellent therapeutic results are achieved by the administration of synthetic vitamin compounds such as thiamin. The psychoses of alcoholics, as delirium tremens, are rapidly alleviated by vitamin ingestion.

The shock treatment, which was first introduced for schizophrenia, has now been extended to the field of the depressions with amazing results. Melancholia even of long duration may be rapidly alleviated by two or three induced convulsions or shocks brought on by metrazol. Even elderly individuals are successfully treated. The effect seems to be largely psychological but improvement of cerebral circulation and release of pent-up tensions are probably other factors in the recovery process. (See also ENDOCRINOLOGY; PHYSIOLOGY; PSYCHIATRY; MEDICINE; VITAMINS.)

Netherlands, area 13,440 sq.mi.; pop. (est. Dec. 31, 1938) 8,728,560. Chief towns (pop. Dec. 31, 1938) Amsterdam (793,526); Rotterdam (612,372); The Hague (495,518.) Ruler: Queen Wilhelmina; president of the Council of Ministers: Jonkheer Dr. D. J. de Geer; language: Dutch; religion: Christian (1930 census: Dutch Reformed Church: 2,732,333; Roman Catholics: 2,890,022).

History.—Naturally the European conflagration overshadowed all other events in 1939, especially in view of Holland's geographical situation. Quite apart from all questions of right and wrong as between the belligerents, it should be borne in mind that although Great Britain is Holland's best customer, Holland's economic relations with Germany are of great importance to her, a fact which renders her position as a neutral all the more difficult.

A new commercial treaty between Holland and Germany was signed on March 25, the main purpose of which was to effect exchanges of goods equitable to both sides. In April Holland intensified her military precautions and introduced a Government scheme for insurance against maritime war risks. The subsequent sinking of several of her ships—notably the "Simon Bolivar" and "Sliedrecht"—amply justified this measure. On May 19, the minister of finance—Mr. de Wilde—resigned on account of differences of opinion relative to the 1940 budget. The state visit paid by Queen Wilhelmina to King Leopold on May 23 was an event of great political importance as it reaffirmed the friendship

THE DUTCH BARRICADED their frontier roads in 1939 with all manner of obstacles to mechanized forces

between Holland and Belgium. Holland continued her great work of peace, namely, the reclamation of the Zuyder Zee. Steady progress has been made during 1939. The north-eastern Polder is now under construction and a new great dyke connects the island of Urk with the mainland.

On June 29, the cabinet resigned, after difficulties relative to financial policy. On July 23 the prime minister, Dr. Colijn, succeeded in forming a new cabinet which excluded the Roman Catholics, but a few days later it was voted down by the Second Chamber and resigned. In August Jonkheer de Geer formed a new cabinet which included social democrats for the first time.

The suspension of payments by Mendelssohn's Bank caused a financial sensation and *inter alia* caused considerable losses to a great Netherlands' bank.

On August 24, the statesmen of the Oslo bloc met in Brussels to discuss various problems of common interest. In this month Germany confirmed that Holland's neutrality would be respected in the event of a European war. On September 1 Great Britain did likewise with the proviso that no other power violated its guarantee.

Princess Irene Emma Elizabeth, second daughter of H.R.H. Princess Juliana and Prince Bernhard, was born on August 5.

General mobilization took place on August 28 and Lieut. Gen. Reynders was appointed Commander-in-Chief of the Netherlands

NETHERLANDS: Industrial production index (*The Annalist*)

Army and Navy. Various emergency laws became operative and measures were taken to safeguard Holland's economic position.

On August 29—on the initiative of Queen Wilhelmina—she and King Leopold offered their good services to France, Great Britain, Germany, Italy and Poland, in an attempt to find a way out of the political deadlock. Holland proclaimed her neutrality on September 3.

On November 4 the Netherlands Government published an *Orange Book* relative to various negotiations with the belligerents. On November 9 Queen Wilhelmina and King Leopold again offered to mediate between the belligerents. (C. M. Me.)

Education.—In 1938: elementary schools 7,812: scholars 1,242,778; secondary schools 288: scholars 62,301; high schools (1937-38) 4: scholars 3,037; universities (1937-38) six: scholars 9,471.

Banking and Finance.—Revenue, ordinary (est. 1939) 602,153,493 florins; expenditure, ordinary (est. 1939) 744,732,786 florins; public debt (Dec. 31, 1938) 3,986,628,806 florins; notes in circulation (July 31, 1939) 1,036,976,000 florins; gold and silver reserve (July 31, 1939) 1,153,448,000 florins; exchange rate (average 1938) 8.89 florins=£1 sterling; (July 31, 1939) 8.82 florins=£1 sterling.

Trade and Communication.—Overseas trade (merchandise) 1938: imports 1,414,768,000 florins; (Jan.-Aug. 1939), 983,450,000 florins; exports 1,039,156,000 florins; exports (Jan.-Aug. 1939), 703,710,000 florins. Communications and transport 1938: roads, suitable for motor traffic 16,000mi.; railways, open to traffic 2,016mi.; rivers and canals, navigable 4,817mi.; airways, distance flown 6,629,000mi.; shipping (June 30) 2,855,400 gross tons; launched (July 1938-June 1939) 246,400 gross tons; entered with cargoes 27,606,524 net tons; cleared with cargoes; 23,151,428 net tons. Motor vehicles licensed (Aug. 1, 1938): cars 94,000; buses 4,088; trucks 50,988; cycles 55,140; wireless (June 30, 1939): registered receiving sets 839,542; connections with radio-distributing-systems 368,710; telephone subscribers (Dec. 31, 1938) 302,808.

Agriculture, Manufactures, Mineral Production.—In 1938, in metric tons, rye 551,060; (1939) 554,000; oats 446,549; (1939) 332,000; wheat 433,762; (1939) 362,000; coal 13,487,524; pig iron and ferro-alloys 299,000; potatoes 2,842,800; barley 140,465; (1939) 130,000; beet-sugar 191,321; butter 103,000; cheese 124,900; flax (fibre) 17,100; superphosphates of lime 569,855; lignite 170,637; wood pulp 105,000; paper and paper boards (1937) 535,000. Industry and labour: index of industrial production (1929=100) (average 1938) 96.1; (average May 1939) 106.3; workers employed in industry (average 1938) 827,000; (May 31, 1939) 930,000; wholly unemployed, registered (average 1938) 303,422; (June 30, 1939) 196,166. (W. H. Wn.)

Netherlands Colonial Empire. Total area (approx.) 845,800 sq.mi.; total population (est. Dec. 31, 1938), 76,401,000. The table lists the mother country and its various possessions:

Neumann, Heinrich (1873-1939), Austro-Hungarian otologist, was born at Hethars, Hungary on June 16 and studied medicine at the University of Bucharest, later completing his course at the University of Vienna. He began to specialize in diseases of the ear shortly after his graduation from the latter institution, and in 1912 he became chief of the surgical department of the Business Men's hospital in Vienna. In 1918 he was appointed to the faculty of the University of Vienna. Dr. Neumann became famous for his successful operations on the middle and inner ears; his later patients were to include King Edward VIII of England and King Alphonso XIII of Spain. He was arrested in Vienna four days after German troops invaded Austria in March 1938 but was later freed by the Nazis. He went then to Switzerland and, in the spring of 1939, to New York city, where he died November 6.

Neutrality. The status of neutrality, which had almost been abandoned as a legal conception during the years immediately succeeding the establishment of the League of Nations, began to revive in 1931 when the League proved unequal to the task of restraining Japan, and thereafter gradually reacquired its traditional place in international law when Italy successfully defied the League in 1935 and Japan again defied it in 1937. Small States, members of the League, which had hitherto expected to play their part in enforcing the sanctions of the League, began to consider how they might maintain a position of neutrality now that the authority of the League appeared unequal to the task of preventing war.

The United States, which had never renounced the status of neutrality, now sought to protect itself against being drawn into another world war by adopting legislation in 1935 and 1937 designed to restrain its individual citizens from performing acts which, although permissible under the general law of neutrality, might have the effect of giving rise to incidents tending to arouse sympathy for or hostility to one or other of the belligerents and thus create the danger of drawing the country into the war.

In April 1939, with the possibility of war in Europe imminent, new legislation was proposed in Congress and public hearings were held upon a wide variety of bills. Chief among these was the Thomas Resolution, which sought to distinguish between belligerents on the basis of their violation or observance of treaties not to resort to war, forbidding shipments of materials of war to the former and permitting them to the latter. Other bills ranged all the way from complete prohibition of all shipments of war materials to the free sale of them under the traditional rules of international law. Congress adjourned in August without taking action. In the meantime, however, the "cash and carry" provisions of the act of 1937 were allowed to expire by time limit on May 1, 1939, without renewal.

Upon the outbreak of war on September 3 the President issued two distinct proclamations of neutrality, the first based upon the obligations of the United States as a neutral in accordance with the rules of international law and the provisions of domestic statutes in harmony with international law; the second based upon the act of May 1, 1937, the revision of which had been under consideration during the last session of Congress. Congress was summoned in special session, and on September 21 the President delivered a message recommending on the one hand the enactment of legislation prohibiting the ship-

ment of goods to the belligerents in American vessels and requiring the foreign buyer to take transfer of title in the United States, and on the other hand the repeal of the existing embargo on the shipment of arms, ammunition, and implements of war, and a return to the traditional rules of international law.

The "Neutrality Act of 1939."—A joint resolution was introduced in the Senate striking out all but the enacting clause of the Bloom bill, which had been passed by the House during the summer, and containing provisions substantially in accord with the President's recommendations. The resolution provided that whenever the President, or the Congress by concurrent resolution, should find that there exists a state of war between foreign States he should issue a proclamation naming the States and thereafter it should be unlawful for any American vessel to carry passengers or articles or materials to any State named in the proclamation and unlawful for any person to export or transport to any such State articles or materials until all title and interest therein should have been transferred to some foreign Government or national.

Together these two sets of provisions had come to be known popularly as the "Cash and Carry" plan. A later amendment permitted the transport of goods, other than arms and ammunition, to the possessions of belligerent countries in areas other than the North Atlantic and the Mediterranean. "Combat areas" were to be proclaimed by the President, and thereafter it should be unlawful for any American vessel to proceed into or through any such combat areas. American citizens were forbidden to travel on vessels of the States named in the President's proclamation; American vessels engaged in commerce with any foreign State were not to be armed; no person within the United States could purchase or sell the securities of Governments of the States named in the proclamation or make any loan or extend any credit to such Governments, or solicit or receive any contribution on their behalf. Further provisions were designed to prevent the use by belligerents of American ports as bases of naval supply and to restrict the use of American ports by submarines and armed merchantmen. The resolution omitted the specific embargo upon the shipment of arms contained in the acts of 1935 and 1937, so that all goods of whatever character were made subject to the same provisions.

The resolution was debated at length in the Senate, finally passing by a vote of 65 to 30. Debate in the House was briefer, the vote in favour being 243 to 181.

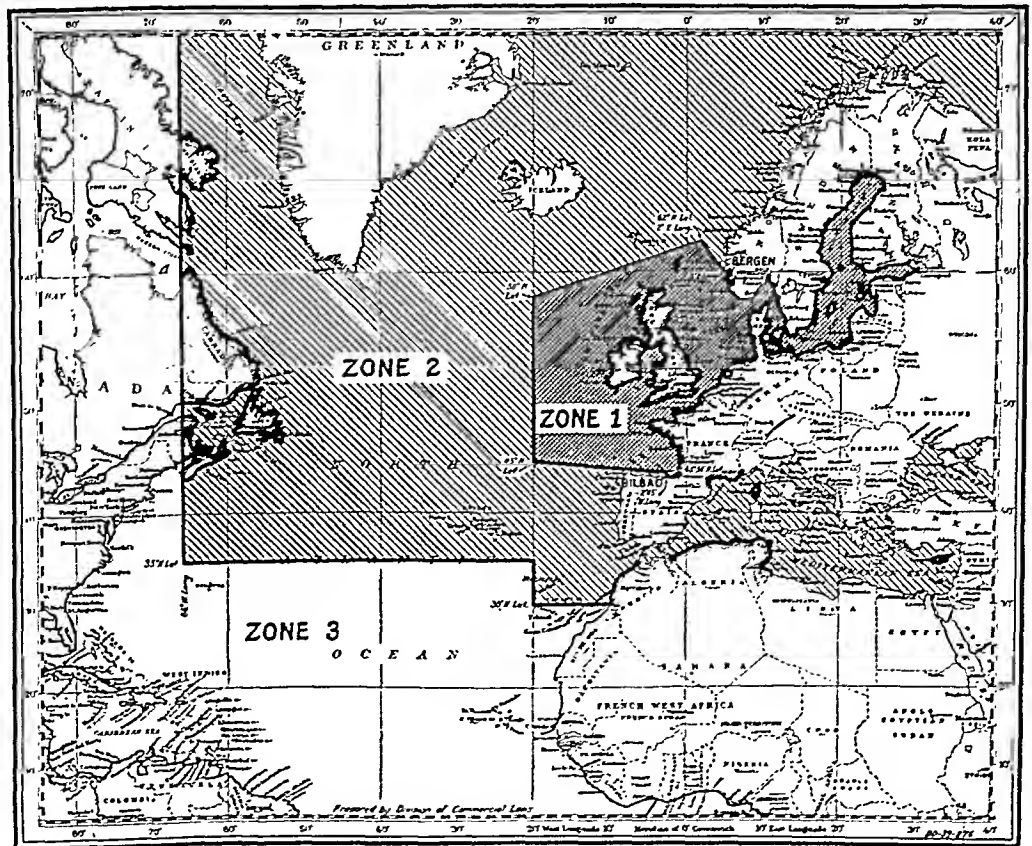

Proposed Transfer of Merchant Ships.—Immediately upon the passage of the law the question arose whether certain American ships belonging to the United States Lines, formerly engaged in trade with the belligerents, might be transferred to the flag of Panama. The proposed transfer was sharply criticised as being an attempt to evade the law, chiefly because the United States Lines, which requested permission to transfer, had a

controlling interest in the Panama company. The President, after hesitation, finally ordered the Maritime Commission to forbid the transfer.

Effect of U.S. Legislation.—The importance of the special neutrality legislation of the United States lay in the effect which it was certain to have upon the fortunes of the belligerent States. Just as the restrictions placed upon American shipping and upon the extension of credits to belligerents operated to the advantage of Germany, so the lifting of the embargo upon arms operated to the advantage of Great Britain and France. International law does not require a neutral to adjust its legislation so as to operate with equal effect in respect to the belligerents. Geographic location and control of the sea are permitted to have their natural results. The objection was raised by a number of persons, whether the United States was free to change its neutrality legislation during the progress of a war, when its motive was to aid one side against the other; but this was answered by saying that so long as the United States was acting within its acknowledged rights no foreign nation was privileged to claim that the motive of the United States was any other than that stated by Congress in the law, namely the preservation of its neutrality.

General Neutrality Problems: Submarines and Mines.—In respect to the traditional rules of international law, as distinct from special national legislation, controversies soon arose as to the use by the belligerents of certain instrumentalities and methods of warfare by which neutral States were indirectly affected. Complaints against Germany arose when submarines sank neutral merchant vessels carrying goods alleged to be contraband to the enemy, the justification given by Germany for their destruction being the fact that it was impossible for the submarine to bring the neutral vessel into a German port for condemnation by a prize

U.S. SHIPS AND CITIZENS were forbidden by presidential proclamation on Nov. 4, 1939, to enter waters in a specified "combat area" (zone 1 on the Government map). Ships may travel in zone 2 but must not enter ports of belligerent countries or their possessions unless they carry no passengers or cargo (shorelines indicated by heavy lines)

AFTER ROOSEVELT'S ANNOUNCEMENT Sept. 6, 1939, that the U.S. Navy would patrol the Atlantic and the Caribbean to keep informed of belligerent activities, the work of reconditioning 116 old destroyers for patrol began immediately

court. By November the complaints of neutrals against submarine warfare were supplemented by complaints against the use of automatic contact mines in violation of the rules of international law. Large numbers of neutral merchant vessels were sunk by mines sown near the entrance to the Thames river, and along the eastern coast of Great Britain and in other parts of the North sea. A Dutch vessel, the "Simon Bolivar" of 8,309 tons, an Italian vessel, the "Grazia," of 5,857 tons and a Japanese vessel, the "Terukuni Maru" of 11,930 tons were among others sunk during the second and third weeks of November.

"City of Flint."—On October 9 the United States merchant vessel, "City of Flint," was captured by a German warship for alleged carriage of contraband destined to a British port, and was taken by a German prize crew to the Russian port of Murmansk. The United States promptly called upon the Russian Government to release the vessel by reason of its presence in a neutral port which, under international law, was not permitted to harbour a belligerent prize of war except under conditions of necessity not present in the case. The Russian Government, in spite of protests from the American ambassador, released the vessel to the German prize crew; but when the vessel put into a Norwegian port the Government of Norway interned the German crew and released the vessel to its American crew.

British Contraband Regulations.—In the announcement of its contraband schedules Great Britain retained the distinction between absolute and conditional contraband, placing fuel and instruments of transportation in the first category, but placing food and clothing in the latter category. The distinction, however, quickly broke down when Great Britain resorted to the practice followed during the World War of "rationing" neutral countries adjacent to Germany so as to prevent them from selling their entire domestic production to Germany and making up for the larger sales by increased imports for their own consumption.

The Navicert System.—In order to exercise a more complete supervision over neutral trade with Germany and at the same time to meet the complaints of neutrals over delays due to detention in port for purposes of inspection, Great Britain instituted a sys-

tem of navicerts, by which neutral vessels could submit their cargoes to examination before leaving their home ports and receive from the British consul a document, navicert, which would insure them free progress through the controlled traffic zones. Protests were entered against these navicerts on the ground of subjecting neutral trade to restrictions not authorized by international law.

Submarines and Neutral Ports.—The practical difficulty during the World War of making submarines conform to the laws of war in respect to the safety of the passengers and crew of neutral vessels intercepted by them had led to the adoption of several international conventions condemning their use unless they conformed to the traditional law.

These conventions led a number of neutral States, upon the outbreak of war in September, to consider the advisability of excluding submarines from their neutral ports. The United States neutrality legislation of 1935 and 1937 had made provisions for their exclusion; and on October 18, the President by proclamation denied them the use of American ports except in cases of entrance due to *force majeure*.

Status of Armed Merchantmen.—Likewise deriving from World War precedents, the question arose whether belligerent merchant vessels might arm for defence against submarine attacks without losing their character as commercial vessels in respect to privileges in neutral ports.

The United States Neutrality Act of 1939 also made provision for denial of admission of such vessels to American ports if deemed by the President to be a necessity for the protection of neutral security or commercial interests; but no action was taken in respect to them.

Declaration of Panama.—An important extension of the right of neutral States to be free from the operations of war took place at the meeting of the ministers of foreign affairs of the American republics at Panama, September 23-October 3. The "Declaration of Panama," there adopted, asserts on the part of the American republics a right to have the waters adjacent to the American continent "free from the commission of any hostile act by any non-American belligerent nation." The demarcation of this security zone is put forth "as a measure of continental self-protection." It extends roughly to a distance of 300mi. from shore, so as to insure not only that hostilities will not be committed near the shore but that inter-American trade routes will not be endangered.

The Declaration announces that the American republics will endeavour "to secure compliance" by the belligerents with the rights thus asserted, and if necessary will consult together to determine upon the measures which they may individually or collectively take to this end.

The General Declaration of American Neutrality.—In addition to the Declaration of Panama the meeting of the ministers of foreign affairs adopted a General Declaration of Neutrality of the American republics, in which the American republics affirmed their "status of general neutrality" and undertook to state "standards of conduct" which they proposed to follow in order to maintain their neutral status and to fulfill their neutral duties. These standards are set forth in a series of rules to be followed; and it was further provided that, with a view to formulating further recommendations based upon experience and changing circumstances, there should be established for the duration of the war an Inter-American Neutrality committee, composed of seven experts in international law. The committee was scheduled to hold its initial meeting at Rio de Janeiro on Jan. 15, 1940.

Case of the "Graf Spee."—Both the Declaration of Panama and the General Declaration of Neutrality were put to the test when on December 13 the German pocket battleship, "Admiral

Changing Concepts of Neutrality.—While the relations between neutral States and belligerent States have during the opening months of the war been governed by appeal to the traditional rules of international law, it is significant that the policies of a number of neutral States have shown many deviations from the more rigid status of neutrality hitherto defined by international law. Italy, for example, although still neutral has not hesitated to give official expression to sympathy with Germany which is not in accord with traditional law. Russia, although neutral in respect to the war between Germany and Poland, assisted Germany in the conquest of Poland and annexed a share of the Polish

(C. G. Fk.)

Agriculture and Mineral Production.—According to the latest census there were 3,696 farms in Nevada having a farm population of 15,385. The State has a total farm acreage of 3,621,769 acres.

The principal crop is hay. The number of cattle populating Nevada ranches was listed on Dec. 1, 1939, as 360,000 beef cattle; 21,000 dairy cows; 23,000 hogs and 845,000 sheep; the number of sheep shorn was 774,000, and the shearings totalled 6,192,000lb. of wool.

The mineral production of Nevada in 1938 was valued at \$23,529,064 in gold, silver, lead, copper and zinc—a decline of 32%. Gold production for the year totalled \$10,375,190; silver, \$2,815,658; copper, \$9,049,124; lead, \$430,468; zinc, \$858,624. The production of gold alone showed an increase for the year of 5%. Silver, copper, lead and zinc all showed decreases in production. Nevada retained its position as the principal tungsten producer. In 1938, shipments of concentrates totalled 1,461 short tons, reduced to the equivalent of 60% WO₃. The production of vanadinite was seven tons and no molybdenum was produced in 1938. One carload of manganese ore was shipped. Mercury was produced in a number of counties of Nevada. The total output of the State, however, was only 336 flasks. An estimate of the 1939 output is expected to show an increase, especially in gold, silver, copper, tungsten and mercury production.

In gem stone production Nevada showed increases, during 1938; 8,000lb. of turquoise and turquoise matrix were marketed at \$3 per pound; 39 mines were noted in the State. The discovery of emerald was made early in 1939, but the importance of the find is in doubt. (E. C. D. M.)

Newbery Medal: see AMERICAN LIBRARY ASSOCIATION; CHILDREN'S BOOKS; LITERARY PRIZES; *United States*.

New Brunswick, one of the original Provinces which united to form the Dominion of Canada in 1867; area 27,985 sq.mi.; population, according to the Dominion census of 1931, 408,219, estimated Jan. 1, 1940, 445,000. Capital, Fredericton, 8,830. The only other cities are Saint John, 47,514, the most important port, and Moncton, 20,689, the main divisional point of the Canadian National Railway in the Maritime Provinces. Of the Province's population 263,432 are rural, or 64%; 403,049 are Canadian born or nearly 99%. The present Government assumed office in 1935 as the result of a Liberal victory over the Conservatives.

A provincial election in Nov. 1939, resulted in the return of 27 Liberal as against 21 Conservative members. The lieutenant-governor, who is appointed by the Dominion Government for a term of five years, is the Hon. Murray MacLaren. The Premier and Minister of Public Works is the Hon. A. A. Dysart.

New Brunswick has a system of free schools and the law provides for the compulsory attendance of children but, largely as the result of the presence of a large number of French Canadians in the north and east of the Province, the law is not strictly enforced. This, together with the sparseness of the population, is largely responsible for the fact that nearly 7% of the population can neither read nor write. The enrolment in the public day schools is (1940) 94,179; in private day schools 2,395. There are two universities in the Province, the University of New Brunswick, which is financed and controlled by the Government and has an enrolment of 365, and Mount Allison university with an enrolment of 445. The value of the net production for the Province in 1936 was \$63,573,236, an increase of nearly 4% over the preceding year. The maximum of the 14-year period ending in 1934 was reached in 1928. The high level of that year was followed by four years of decline. The estimated wealth of the Province is \$855,511,000; wealth per capita \$2,118. The net value of manufactured products in 1937 was \$28,770,727, a slight increase over the preceding year. The gross value of agricultural products in 1937 was \$26,517,000. New Brunswick is not an important mineral-

producing Province, the value of the output in 1938 being only \$3,766,265.

New Brunswick is represented in the Dominion Parliament by 10 Senators, appointed for life, and 10 members of the House of Commons, who are elected for five years or less.

Newfoundland and Labrador. Area: Newfoundland 42,000 sq.mi.; Labrador 110,000 sq.mi.; total 152,000 sq.mi.; pop. (est. Dec. 31, 1938): Newfoundland 290,660; Labrador 4,780. Chief town (capital, pop. est. 1938) St. Johns (41,000). Governor: Sir Humphrey Walwyn, K.C.M.G., K.C.S.I., C.B., D.S.O.; language: English; religion (1935 census): Roman Catholic 93,925; Church of England 92,732; United Church 76,110; Salvation Army 18,054.

History.—The island of Newfoundland off the east coast of Canada, which has sovereignty over the mainland area of Labrador, is a British Dominion with its government as such in suspension since 1933. It is at present administered by a Commission of Government instituted by the Imperial Government.

J. H. Penson, the commissioner for finance, in the course of his budget speech on July 3 outlined an extensive program of reconstruction with which the Government intended to proceed. This would involve the expenditure of some £197,000 on agriculture, £321,000 on roads and bridges, £25,000 on land settlement, £20,000 on medical services, and £20,000 on educational buildings, as well as provision for five additional bait depots and aid for the manufacture of herring meal and oil. The Commission Government introduced its first tax increase by raising the excise on local manufactures of beer, cigarettes, and tobacco.

The year was noteworthy for the visit of the King and Queen on their way home from their tour of Canada and the United States.

Education.—In 1938: schools 1,166; scholars on rolls 62,272; average attendance 43,406.

Banking and Finance.—Revenue, ordinary (est. 1939-40) \$11,381,700; expenditure, ordinary (est. 1939-40) \$13,634,732; expenditure, reconstruction and special (1939-40) \$5,735,208; public debt (June 30, 1938) sterling £20,392,543, Canadian \$625,000; notes in circulation (June 30, 1938) \$44,823; exchange rate as Canadian dollar.

Trade and Communication.—Overseas trade 1938-39 (merchandise): imports \$24,500,000; exports \$31,500,000. Communications (Dec. 31, 1938): roads, main 1,150mi.; secondary and local 6,000mi.; railways, open to traffic 747mi.; motor vehicles licensed (1938): cars 3,966; trucks 1,082; cycles 172.

Mineral Production and Fisheries.—Fisheries (inshore, cod and Labrador) 115,604 metric tons. Seal fishery (1938) \$189,384; salmon fishery (1938) \$368,030; lobster fishery (1938) \$267,923; fish oils (1938) \$189,384. In metric tons: wood pulp 342,000; iron ore (metal content) 890,000; lead concentrates (1938) 42,652; copper concentrates (1938) 33,382; zinc concentrates (1938) 124,036; silver (1938) 47.9; gold (1937) 699 kilograms.

New Guinea: see DUTCH EAST INDIES; MANDATES; PACIFIC ISLANDS, MANDATED.

New Hampshire, one of the original States of the United States, popularly known as the "Granite State"; area, 9,282 sq.mi.; population (U.S. census 1930) 465,765.

293, estimated July 1, 1937, 510,000. Capital, Concord, 25,228. Other cities with populations exceeding 20,000: Manchester, 76,834; Nashua, 31,463; Berlin, 20,018. Of the State's population 273,079, or 58.7%, were (1930) urban; 464,350 whites. Of the white population, 381,690 were native born, and 82,660, foreign born. Important foreign-born elements were: United Kingdom 11,539; French Canadians, 37,682; other Canadians, 13,277.

History.—Governor, Francis P. Murphy; secretary of State, Enoch D. Fuller; State treasurer, F. Gordon Kimball; adjutant general, Charles F. Bowen; attorney-general, Thomas P. Cheney (all Republican). U.S. Senators from New Hampshire are H. Styles Bridges and Charles W. Tobey (both Republican). Congressmen are Arthur B. Jenks and Foster Stearns (Republican). The 162nd session of the General Court of the State extended from Jan. 4 to June 17, 1939. Important measures enacted were those authorizing a \$5,000,000 bond issue for construction, reconstruction and maintenance of highways and for reimbursement of towns for hurricane and flood damage; levying a 15% tax on all tobacco products as a means of eliminating the direct tax of \$1,200,000 a year; approving acquisition by the Federal Government of land at four sites in New Hampshire for construction of flood control dams; extending legality of pari-mutuel horse race betting through 1942.

Education.—There are in New Hampshire 1,693 public schools, including 103 approved public high schools; 16 public academies approved as high schools; 5 accredited private academies; 608 private schools; and two teachers' colleges (formerly designated normal schools) at Plymouth and Keene. There are also four institutions of higher education: University of New Hampshire, Durham; Dartmouth college, Hanover; St. Anselm's college, Manchester; and Colby Junior College for Women, New London. There were in 1939 some 198 juvenile camps licensed by the State Board of Health. Total State expenditures for public education, year ending June 30, 1938, \$7,458,043. Last available report of the State Board of Education shows a total of 82,181 public school pupils and 33,037 private school pupils, with a total of 115,218 pupils in all schools.

Banking and Finance.—Savings banks and savings departments of trust companies reported deposits of \$204,464,415, as of June 30, 1939, being an increase over June 30, 1938, of \$3,263,868. There were also 28 building and loan associations with assets of \$11,970,454, an increase of \$293,562 over the preceding year. Cash receipts of State Treasury Department, for fiscal year ending June 30, 1938, \$44,320,965; cash disbursements, \$43,072,192. Net bond and note debt June 30, 1938, \$13,683,000. Average tax rate in 1936, \$34.30 on each \$1,000 of valuation.

Agriculture, Manufactures, Mineral Production.—Major farm products are milk and cream, potatoes, apples, dairy cattle and live poultry, marketed principally in cities of Eastern and Central Massachusetts and New York city. Estimated acreage in 1934, used for crops, 448,000; for pasture, 961,000; woodland, 1,274,000. Lumber production, 1936, estimated at 161,000,000 board feet. Number of farms, 1935, 17,695, with average acreage of 119.6; average value per acre, \$31.64. Principal industries produce textiles, boots and shoes, and lumber and wood products, including paper. Value of manufactures in 1937, \$249,631,724. Electric power generated in 1937, in kilowatt hours: water power, 706,000,000; fuel power, 56,000,000. Estimated direct gross income from recreational facilities within the State, in 1936, \$9,641,503. An important report was submitted in 1939 to the Commission for the Promotion of the Wealth and Income of the People of New Hampshire. It finds that in 1936, the people of the State as individuals saved \$13,761,000, but that the net loss in business, banking and government amounted to \$17,750,000. Of the total State income, 51.5% came from manufacturing; 19.6% from serv-

ice; 13.6% from trade and finance; 9.9% from transportation and communication and 5.4% from agriculture. The report embodies what is claimed to be the first such economic analysis of a State as a unit ever made. A report on industry was also issued by the State Planning and Development Commission, which estimates that between 1933 and 1937, the value of the manufactured products of the State increased by more than 50%. (W. E. Ss.)

New Hebrides: *see* PACIFIC ISLANDS, BRITISH; FRENCH COLONIAL EMPIRE.

New Jersey, described as the "Garden State," was one of the original States of the United States; area 8,224.44 sq.mi.; population according to U.S. census of 1930, 4,041,000, estimated by U.S. Census Bureau, July 1, 1937, 4,343,000; capital, Trenton, 120,000. The largest city is Newark, population 1930, 442,337. Of the State's population in 1930, 1,571,548 were native whites and of native parentage; 208,828 coloured; 1,413,239 native white and of foreign or mixed parentage; 844,442, foreign born. The urban population was 3,339,244, or 82.6%.

History.—The Republican Party in the 1939 elections added to the gains begun in 1938 when W. Warren Barbour was elected to the United States Senate for the unexpired term of Governor A. Harry Moore, Democrat. Only legislative and local offices were at stake, but the Republicans took control of the 1940 legislature by the largest majority since 1930. The House of Assembly will line up with 45 Republicans to 15 Democrats and the Senate will be Republican 16 to 5.

New Jersey joined the States which have turned to race tracks in quest of new revenues. A constitutional amendment, adopted in 1896 to prohibit gambling, was modified at a State-wide referendum to permit pari-mutuel betting at race tracks. Supported by the Democratic State machine and Republican machines in most counties, the referendum was carried by 152,000 votes. When the year 1939 ended, however, no race tracks were operating in the State because the legislature had failed to agree on the proper form of racing control and no racing commission had been appointed because of a fight between the Senate and the Assembly.

This factional Republican quarrel seriously impeded the work of the legislature and agreement was impossible on most controversial issues. It was not until mid-summer that an agreement was reached on the method of financing relief for 1940-41. Then the legislature authorized a referendum on a bond issue of \$21,000,000, representing the State's share of relief. The referendum was carried by 47,000 votes, largely because the electorate was convinced that municipalities were in no position financially to carry the full load and because no alternative program had been provided by the legislature.

The lack of accord between the Senate and the Assembly was reflected also in the failure to pass promised election reform measures and to compromise overdue taxes owed by New Jersey railroads. The roads offered \$14,263,000 in settlement of arrearages which aggregated approximately \$32,000,000 including interest and penalties. Subsequently the Central Railroad of New Jersey filed a petition in bankruptcy contending this action was necessitated by the failure of the legislature to agree to a compromise. Later Judge Philip Forman in the United States District Court declared the State's formula of taxing railroads to be invalid and the effect of the decision was to cancel approximately \$15,000,000 which the State claimed to be due for 1934-35-36. The controversy between Mayor Frank Hague of Jersey City and the C.I.O. was terminated by the Supreme Court of the United States. The court ruled unconstitutional an ordinance under which the police power was used to prohibit public meetings in streets and parks. The decision upheld an injunction by Judge William Clark

of the Third Circuit Court of Appeals which prohibited Jersey City officials from interfering with the right of free speech and free assemblage.

In 1939 the State's payroll reached an all-time high of \$24,000,000 due to "broader State activities." The State continued its policy of requiring examination of motor vehicles twice a year, at a charge of 50 cents for each inspection. This system was adopted as a safety measure and traffic deaths were approximately 11% under 1938.

Finance.—The net valuation of taxable real and personal property for 1938 was \$5,667,877,713. That was a decrease from 1937 of \$100,425,888. These ratables are made up as follows: Real estate, exclusive of second class railroad property, \$4,815,510,255; second class railroad property, \$197,994,407; personal property, \$718,889,817. The average tax rate for 1938 was \$4.535 per \$100 of valuation. Real estate and personal property specifically exempted from taxation for 1938 amounted to \$1,058,536,661, comprised mainly of schools, churches and charitable properties.

For the fiscal year ended June 30, 1939, New Jersey collected \$160,788,000 in taxes, which did not include unemployment compensation taxes.

Agriculture and Manufacturing.—Weather conditions in 1938 were generally unfavourable and crop production in New Jersey declined accordingly. The total crop of grains, potatoes, hay, berries and vegetables fell from 56,129,000 units (generally bushels or crates) in 1937 to 50,500,000. Prices were below the previous ten-year average. Prices stood at 77 cents per unit, three cents less than in 1937 and 15 cents below the preceding 10 years. The estimated value of the 1938 crop was \$41,819,000 and of livestock \$51,245,000. (A. J. S.)

New Mexico, the fourth largest State in the South-western United States, popularly known as the "Sunshine State"; area, 122,634 sq.mi.; population according to the U.S. census of 1930, 423,317 (official estimate July 1, 1937, 422,000). Capital Santa Fé, 11,900. Albuquerque is the only larger city, 27,200. Of the State's population 106,816 are urban, or 25.2%; 331,755 white; 59,340 Mexican; 28,941 Indian.

History.—The Administration, legislature and congressional representation of New Mexico is Democratic. The chief officers of State elected for two years are: governor, John E. Miles; lieutenant-governor, James Murray, Sr.; secretary of State, Jessie M. Gonzales; auditor, E. D. Trujillo; treasurer, Rex French; attorney-general, Filo Sedillo; superintendent of public instruction, Grace J. Corrigan; commissioner of public lands, Frank Worden. The national representatives are Senator Carl A. Hatch, Senator Dennis Chavez and Representative John J. Dempsey.

Education.—For the school year 1937-38 public schools cost \$9,001,045 for 129,877 children. The State also supports the University of New Mexico, College of Agriculture and Mechanic Arts, Normal university, School of Mines, Normal school, Eastern New Mexico Junior college, Spanish American Normal school, and the Military Institute.

Charities and Correction.—State charitable institutions are: School for the Deaf, School for the Blind, Home and Training School for Mental Defectives, Industrial school, Girls' Welfare school, Insane Asylum, Miners Hospital, penitentiary and the Carrie Tingley Crippled Children's Hospital.

Banking and Finance.—On June 30, 1939, there were 41 banks with total deposits of \$57,054,000. The assessed valuation of New Mexico is \$312,442,485. Total State revenue receipts for the fiscal year ending June 30, 1939, were \$22,608,766.52. A 5¢ gasoline tax yielded \$4,570,713.76; a 2% sales tax, \$3,451,997.95; and a 5.60 mills general property tax, \$1,877,488.00. An estimated \$80,000,000 was spent by tourists.

Agriculture and Mineral Production.—The leading farm products were: gr. sorghums, 4,725,000bu.; wheat, 2,960,000bu.; corn, 2,552,000bu.; beans, 643,000 bags; cotton, 97,000 bales. In 1938 there were 1,190,000 head of cattle, worth \$36,129,000, and 2,334,000 sheep worth \$11,906,000.

Mineral production for 1939: copper, \$9,549,904; zinc, \$3,362,108; gold, \$1,294,685.

BIBLIOGRAPHY.—Gladys A. Reichard, *Desza, Woman of the Desert*; T. M. Pearce and James Hall, *Cartoon Guide of New Mexico*; Cleve Hallenbeck, *Alvar Núñez Cabeza de Vaca*. (F. D. R.)

New South Wales. Area 309,432 sq.mi.; pop. (est. March 31, 1939) 2,742,859. Chief towns (pop. est. Dec. 31, 1938): Sydney (1,288,720); Newcastle (115,660). Governor: Capt. the Rt. Hon. Lord Wakehurst, K.C.M.G.

History.—On February 28 B. S. B. Stevens achieved a record term of office as premier of New South Wales. In August, however, following a sharp disagreement on financial policy with Mr. Spooner, minister for works and social services, his government was defeated and resigned. A. Mair became premier at the head of a reconstructed Cabinet which included Mr. Bruxner (deputy premier and minister for transport), Sir Henry Manning (attorney-general and vice-president of the Executive Council), Mr. Drummond (minister for education), Mr. Treatt (minister for justice), Mr. Primrose (acting minister for health), Mr. Gollan (minister for labour, industry and social services), Mr. Reid (minister for agriculture), Mr. Tonking (chief secretary), Mr. Vincent (minister for mines and forests) and Mr. Manfred (assistant minister).

The State Labour Party also suffered from internal strife. The revolt of Mr. Heffron and his followers against Mr. Lang's leadership provoked an inquiry by the Federal Executive of the Australia Labour Party, which recommended a conference of both sections of the party. The Heffron group were favourable, but Mr. Lang strongly opposed interference from outside. The conference took place in August, and resulted in the overwhelming defeat of Mr. Lang, and the election of W. J. McKell as leader of the party.

In estimating a budget deficit of £1,502,309 for the financial year 1939-40 the treasurer announced increases in company taxation, taxation of individual incomes and taxation of motor vehicles, which together were expected to yield additional revenue amounting to £3,900,000. The deficit of £2,448,674 for 1938-39 was larger than anticipated, principally owing to higher railway costs.

Pastoral and agricultural areas suffered from drought conditions early in the year, but there was some improvement later. The autumn lambing was below expectations. Damage from bush-fires and heat in January was estimated at £300,000. On August 18 the premier, Mr. Mair, inaugurated the Deniboota irrigation scheme, built to serve 1,400,000 acres of the Murray river area. Secondary industries continued to thrive, and the Broken Hill Proprietary company declared a record profit at its annual meeting. New industrial enterprises included the formation of a £1,000,000 company for the production of aluminium. (L. R. Mc.)

Education.—In 1938: public schools 3,317; teachers 13,134; scholars on roll 367,052; average attendance 300,768; expenditure by State £5,000,000; private schools 746; scholars 100,720.

Finance.—In 1937-38: revenue £54,346,000; expenditure £54,292,000; debt outstanding (June 30, 1938) £354,299,000.

Communication.—Roads (March 30, 1937) 46,108mi. fit for motor traffic. Railways, Government (June 1938) 6,114 miles. Tramways (June 1938) 188 miles. Motor vehicles licensed (June 30, 1939): cars 216,050; commercial vehicles 84,175; cycles 24,151; buses 777; taxi-cabs 1,313. Wireless receiving set licences (June 1938) 403,978. Telephones (June 1938): exchanges 2,004; instruments connected 244,590.

Agriculture and Mineral Production.—Production in 1937—38: wheat 55,104,000bu.; butter 120,883,000lb.; wool greasy 495,027,000lb.; maize 3,403,000 bu.; coal (1938) 9,570,530 tons; gold (1938) 88,698 fine oz. Industry and labour: average number of employees in factories (1937–38) 224,861; employment (June 1939) 93.7%.

Newspapers. War news led the newspaper story of 1939—war news gathered and transmitted from rapidly shifting centres of distant military, naval, aerial, and diplomatic activities—Spain, Czecho-Slovakia, China, Poland, France, the North sea, and finally Finland—war news confused by new kinds of governmental propaganda, censorship, and short-wave radio gestures. Europe's long "war of nerves" changed on September 1 to "war of military surprises"; instantly the European news machine which the American press had been building for 20 years went into high speed, with American newspapermen in every focal centre sending eye-witness stories that made war correspondents' "by-lines" familiar to the entire American public. As press and radio co-operated, Americans in most remote hamlets watched the great show, blow-by-blow, shot-by-shot, in a way that no other people had ever before watched the daily manoeuvres in a distant war. United in a way perhaps never seen before, American newspapers endeavoured to handle the news in such a manner that the United States should not join the war, that the press should not be accused of leading the people into war, and that readers should not be victims of foreign propaganda in spite of strong sympathies. Such was the theme of almost every newspaper meeting. If there was a jingo press, its voice was unnoticed. By the end of four months of war, it was evident that the much-feared censorship and propaganda of opposing powers were relatively harmless—the two cancelled each other out. This was because the new media of wireless communication opened a free flow of news from both sides of the conflict, unlike the one-sided coverage resulting from cable control during the World War of 1914–18. Significantly, the large "listening staffs" set up by press agencies to glean elusive facts from foreign short-wave radio were shortly disbanded as useless.

It is difficult to express graphically the size of the war news machine that served America. Mainly it was a co-operative effort of newspaper-controlled press associations, rather than the activity of individual newspapers; the entire daily press, large or small, carried the entire story, with no one newspaper leading in "scoops" or accuracy. The Associated Press had more than 100 American-trained reporters in Europe, directed from London by Milo M. Thompson and aided by 2,500 native "string correspondents" and tipsters; the United Press had 500 correspondents in Europe, led by Ed. L. Keen and Webb Miller; the International News Service, smaller but manned by numerous star war men, was directed by Barry Faris in New York. Each of the three agencies reported daily European files ranging from 25,000 to 40,000 words; their daily costs doubled, ranging up to \$6,000, far more than in 1914–18. Press traffic of cable and radio increased 40%. In October the U.P. levied a war assessment of 12½% on its newspaper clients; I.N.S. raised its rates 15%; A.P. charged 5 to 25% extra for news released for radio broadcast. Cable handicaps soon shifted the news centre from London to New York, and shortly Britain received French news via New York. War photos came with the news, by cable, radio, and clipper plane, dozens a day at a cost of \$75 each.

Newspaper circulations rose 3% to 4%, partly regaining the losses caused by raised prices in 1938; on some days millions of war extras were sold. Radio news broadcasts, based on newspaper enterprise, were facilitated when in May the Associated Press relaxed its rule forbidding broadcast of its dispatches.

A MILESTONE in newspaper illustration was the perfection of cabled photographs between Europe and the U.S.A. in April 1939. This test "cable photo" was transmitted from London to New York city April 1 in 20 minutes

With war news leading, the biggest stories of 1939—gauged by newspaper space involved—were so numerous that experts differed widely in listing them. The United Press announced this list, after polling 1,000 client editors: (1) Declaration of war on Germany by England and France; (2) Invasion of Poland by Germany and Russia; (3) Russian invasion of Finland; (4) Russian-German non-aggression pact; (5) Visit of British King and Queen to America; (6) Death of Pope Pius XI and election of Pius XII; (7) Disaster of U.S. submarine "Squalus," followed by loss of British "Thetis" and French "Phenix"; (8) Special neutrality Congress, repealing arms embargo; (9) German annexation of Czecho-Slovakia; (10) Sinking of British liner "Athenia"; (11) Munich beer hall blast 10 minutes after Hitler's exit; (12) German capture of U.S. ship, "City of Flint." To these, other news agencies added: Scuttling of German pocket battleship "Admiral Graf Spee"; Beginning of regular trans-Atlantic air service; Adoption of peace-time conscription in England; Peace pleas of President Roosevelt, Queen Wilhelmina of Holland, and King Leopold of Belgium; German use of mystery magnetic mines; Chilean earthquake; Franco victory in Spanish civil war; Conviction of Tammany leader James J. Hines; and Seizure of Albania by Italy. Looking back over the period, 1930–40, the Associated Press listed as the ten best decade stories: (1) Allies' declaration of war on Germany, 1939; (2) Lindbergh kidnapping, 1932; (3) Abdication of Edward VIII, 1936; (4) Roosevelt bank holiday, 1933; (5) Diplomatic Victory of Hitler at Munich, 1938; (6) Birth of Dionne quintuplets, 1934; (7) Repeal of Prohibition, 1933; (8) Death of Will Rogers and Wiley Post, 1935; (9) British royal tour of America, 1939; and (10) Assassination of Huey Long, 1935.

Because of mounting labour costs, paper prices, and taxation, plus declining advertising income, 1939 brought another large casualty list among daily newspapers; at least 51 suspended, merged, or became weeklies. Several blamed Guild and other strikes. Losses in the Hearst string were: *Chicago Herald-Examiner*, *Milwaukee News*, *Atlanta Georgian*, and *Syracuse Journal*. The Scripps chain suspended *San Diego Sun*, *Oklahoma News*,

"WAR-BLINDED." Packer's protest in *The Daily Mirror* of New York city against international censorship of war dispatches in 1939

Spokane Press, and *Portland (Ore.) News-Telegram*. Other leading dailies that closed were *Chattanooga News*, *Wilkes-Barre Evening News*, *Minneapolis Journal*, *Buffalo Times*, *Rochester Evening News*, and *Newark Star-Eagle*. The number of weeklies, however, increased by at least 25. Analysis over a long period showed the loss of competing dailies offset by new dailies in cities under 10,000 people; the one-newspaper cities had increased from 353 in 1899 to 1,083 in 1939.

The year 1939 saw little improvement in newspaper finances. War increased costs without raising income. Advertising income, down 34% since 1929, rose slightly (about 2%) during the fall but not enough to offset high paper and machinery costs, shortening of hours and raising of wages to a level 30% above that of 1929. Newspaper executives bewailed increased taxation, unemployment and social security levies, and other new costs imposed by Government. The American Newspaper Guild, at its sixth annual convention, held in San Francisco, reported a membership of 18,755 (including 13,727 in news staffs and 5,028 in business offices), as compared with 16,797 (including 13,505 news and 3,293 business) the year before. It waged fewer strikes, most notable of which were the year-long *Chicago Herald-American*, the city-wide *Wilkes-Barre*, and the shorter *Hollywood Citizen-News* battles. The death of Heywood Broun on December 18 removed the Guild president and leader. (G. M. Hy.)

Great Britain.—In Great Britain conditions in the newspaper industry approximated generally to those of the magazine. The difficulties of 1938 were intensified before the close of 1939; rising costs, lack of confidence, and grave uncertainty acted as a brake on the development of old-established businesses and the creation of new enterprises alike, and although the mortality among journals was on a lower scale than that of the magazines their restrictions in size were even more marked—as is exemplified by the fact that whereas the pre-Sept. 1939 average number of pages in an issue of the *Times* was nearly 28½, in December it had fallen to below 15½.

Among the casualties of the year the chief were the *Sunday Referee* and the *Leeds Mercury*. The former was established in London (as the *Referee*) in 1877, and for long maintained a brilliant reputation under G. R. Sims, especially in the theatrical and sporting worlds; latterly, changed in format and content as well as in name, it had been owned by the film magnate, Isidore Ostrer, from whom it was bought by Lord Kemsley and amalgamated with his *Sunday Chronicle* in June. In September the *North Mail* (founded 1923) was merged with the *Newcastle Journal* (1711), and in November the *Leeds Mercury* (1718) with the *Yorkshire Post* (1754), both having been under the same proprietorship. The *Dartford Borough News* was amalgamated with the *Dartford Chronicle*, and the *Sporting Chronicle* (Manchester) with the *Chronicle Mid-day*; while the *Reading Gazette* and *Dumfries and Galloway Courier* announced suspension "for the duration," as did a leading agency, the Central News, Ltd., for all its services except the Parliamentary. Two great national dailies, the *Daily Telegraph and Morning Post* and the *Daily Mail*, relinquished the advertisement revenue of their front page and devoted it to news. (See also ADVERTISING; PHOTOGRAPHY: Applications; PRINTING.)

New York, one of the 13 original States of the Union, popularly known as the "Empire State," covers an area of 49,204 sq.mi. of which 1,550 sq.mi. are water. In 1930 the population was 12,588,066 and in 1939 the estimated population was 13,000,000. Of this total the foreign born number 3,191,549; Negroes, 412,814; and other non-whites, 24,959. The capital is Albany with a population of 127,414. Other principal cities are New York with a population of 7,491,790; Buffalo, 573,076; Rochester, 328,132; Syracuse, 209,326; Yonkers, 134,646; Utica, 101,740; Binghamton, 76,662; Troy, 72,763. Among the great cities of the world New York ranks next to London. The population of the State is 83.6% urban.

History.—At the election on Nov. 7, 1939, Associate Judge Irving Lehman of the Court of Appeals was nominated for chief judge of that court by the Democrats and indorsed by the Republicans, to succeed Chief Judge Frederick E. Crane, who retired on account of age. Because of the long established policy of avoiding a political partisan contest for seats on the bench of this highest court in the State, Judge Lehman was unanimously elected. The legislature, chosen in 1938 for two years when the Republicans gained control of both houses, passed for the second time an amendment to the Constitution modifying the provision which forbids gambling of all kinds so as to permit pari-mutuel betting on horse races in such way as the legislature may prescribe and directing that the State should receive a reasonable revenue from the system. Under the pari-mutuel plan the entire amount bet on a race is pooled and is then divided among the winners in proper proportions less a fee to the agent handling the bets. The existing constitutional prohibition against gambling has been ineffective as the legislature has fixed no penalty for race track betting. The amendment was submitted to the people for their approval at the election on November 7 and was ratified by a vote of about two to one. The majority in its favour in the large cities was overwhelming, while it was opposed in the rural counties, including Saratoga county in which there is a popular race track at Saratoga Springs which attracts thousands of visitors during the racing season. It is estimated that the tax which the legislature is expected to levy will yield \$10,000,000 a year. The State has been receiving \$500,000 a year from a tax on tickets of admission to race tracks. The legislature adopted a budget of \$388,000,000 for the fiscal year of 1939-40 which was \$27,000,000 smaller than the amount recommended by the governor. It levied a tax of two cents a package on cigarettes, or one cent on

every ten or fraction thereof sold at retail. The liquor tax was increased by 50¢ a gallon. An income tax on the salaries of Federal employees was voted. The appointment of a legislative auditor to assist in framing the budget was authorized. Provision was made for free bus transportation and the extension of public health and welfare service to children attending parochial and other private schools. The expenditure of not more than \$1,000,000 a year on a State housing program was voted. Other measures adopted were a constitutional amendment extending the term of senators from two to four years; a reduction to 15% of the cost of removing grade crossings to be levied against the railroads; barring from civil service and teaching positions all persons advocating the overthrow of the Government by force; placing the control of home relief in the hands of the localities; extending the mortgage moratorium to July 1, 1940; making it a misdemeanor to sell merchandise not marked with the place of origin and forbidding "loss leaders" in retail trade; eliminating primary elections where there is no contest for a nomination; changing the date of expiration of automobile licences from January 1, to April 1; regulation of hairdressers, cosmetologists and barbers; permitting banks to close on Saturdays in July and August; permitting osteopaths to perform minor surgical operations and administer drugs when properly qualified; prohibiting members of alien organizations from wearing uniforms resembling those worn in foreign countries; providing for the equal representation of men and women on political party committees; advancing \$900,000 for Federal flood control projects on condition that the money be returned to the State. Among the bills which failed of passage were those providing for compulsory automobile insurance and permanent revocation of licences for drunken driving; universal finger-printing; permitting a verdict of five-sixths of the jury in non-capital criminal cases; making daylight saving mandatory from March to October; reducing from 65 to 60 the age of those eligible for old age pensions; a State wide sales tax for relief; prohibiting private development of water power sites and control of outdoor advertising. The constitutional amendment lengthening the term of senators will have to be passed again before it is submitted to the voters for their approval.

The principal officers of the State are, governor, Herbert H. Lehman, Democrat; lieutenant governor, Charles Poletti; attorney general, John J. Bennett; commissioner of education, Frank P. Graves; secretary of State, Edward J. Flynn; commissioner of corrections, Edward S. Mulrooney; superintendent of banking, William P. White.

Education.—According to the statistics for 1939, there are in the State 10,578 public schools with a total registration of 2,260,652 pupils, instructed by 82,454 teachers. There are 986 high schools with a registration of 714,606 pupils, taught by 25,200 teachers. The cost of supporting the schools is \$354,109,166.20 of which about \$115,000,000 is paid by the State. In addition to the public schools there are 86 colleges and universities in the State. For several years there has been dissatisfaction with the policy of the State in contributing toward the support of the public schools and thus lightening the burden on the local taxpayers. The Board of Regents of what is officially known as the University of the State of New York appointed a committee at its meeting on July 28, 1939, to determine whether the amount of State aid is adequate or excessive and what if any changes should be made in the existing practice.

Correction.—On June 30, 1939 there were 14 institutions under the direction of the department of correction with a total population of 17,176. On that date there were 2,826 inmates in Sing Sing prison; 2,214 in the Attica prison; 2,066 in Clinton prison; 1,667 in Auburn prison and 1,291 in Great Meadow prison. The cost of maintaining the 14 correctional institutions for

the fiscal year ending June 30, was \$10,013,447.77, or about \$582 per capita.

Finance.—Total appropriations for the fiscal year, 1939-40, were \$391,730,241.38. Included in this amount was \$104,729,671.28 for current expenses, \$11,938,763.77 for general charges, \$19,778,600 for capital outlays, \$29,383,474.82 for debt service exclusive of interest on relief bonds, \$140,613,585 for State aid, \$85,286,146.83 for unemployment relief including \$25,368,746.53 for interest on relief bonds. No appropriation was made for \$550,000 for interest on temporary loans to meet the deficit for 1938-39 of \$28,826,403.35. The total obligations for the fiscal year, including the deficit, amount to \$421,106,644.73. The estimated revenues are \$420,379,126.52. The State has a gross debt of \$671,731,000 consisting of \$233,500,000 sinking fund bonds and \$438,231,000 serial bonds. The sinking fund contains \$145,947,430, making the net debt \$525,783,569.

Banking.—There were in the State on June 30, 1939, 1,202 financial institutions incorporated under the banking laws of the State or under the supervision of the banking department. Included in this number are 131 State banks, 162 trust companies, 15 industrial banks, 9 private banks and 134 mutual savings banks. The total deposits in all these institutions on that date were \$16,064,170,537 credited to 10,298,861 depositors. The total capital was \$686,581,204 and the total resources were \$19,447,768,225. Included in the number of institutions reporting to the banking department are 211 building and loan associations with resources of \$259,206,474 of which \$230,944,909 is due to shareholders. On June 30, 1939, in addition to the banks under State control, there were 427 national banks with a total capital of \$281,936,000, deposits of \$6,226,339,000, and assets of \$7,120,224,000.

Communication.—On Jan. 1, 1939, there were in the State 84,270 mi. of highways of which 54,998 were improved. Under State supervision are 13,991 mi. of which 12,731 are paved with concrete, brick, or a bituminous material. The other improved roads belong to county and township systems. During 1938 the highway division of the department of public works obligated itself to spend for maintenance or reconstruction of roads \$25,183,349.54 which included \$9,870,473.42 contributed by the Federal Government.

Wealth and Income.—The assessed valuation of taxable real estate in the State according to the latest report was \$25,548,805,000 which under the system of assessment represents a value of \$30,254,215,000. The total income of the people of the State is estimated at \$10,440,000,000. According to the Federal census of 1935 there were then 177,025 farms with a total acreage of 18,185,741. The land and buildings were valued at \$1,045,391,981, and the live stock was worth \$222,250,942. The farm population was 784,483. According to the latest available figures the State produced 7,533,000 bu. of wheat valued at \$4,750,000; 26,888,000 bu. of oats valued at \$8,744,000; 4,307,000 bu. of barley valued at \$2,067,000; 5,436,000 tons of hay, valued at \$39,139,000. Besides these the farms of the State produced 1,620,000 lb. of tobacco; 9,800,000 bu. of apples; 56,000 tons of grapes, 26,840,000 bu. of potatoes and 100,449,000 lb. of dry edible beans. (G. W. Do.)

New York City. At the election in Nov. 1939, members of the city council were chosen for the second time under the proportional representation system. Each of the five boroughs in the city is entitled to one councilman for every 75,000 votes cast and an additional councilman for a surplusage of 50,000 or more. The outgoing council contained 26 members, but because of the smaller vote polled this year only 21 of the 101 validated candidates received the requisite number of votes to be elected, including 18 of the sitting councilmen. The new council contains 14 Democrats, 2 Republicans, 2 American Labor party

members, 2 Fusion-Citizen party members, and one elected as an independent who is a Democrat. The opponents of Mayor La Guardia, who belongs to the American Labor party, have a two-thirds majority and can override his vetoes if they vote as a unit. They were not strong enough in the retiring council to block the mayor's will in this way. In addition to electing a majority of the members of the city council the Democrats elected all the municipal court judgeship candidates in Manhattan, Brooklyn and Queens boroughs, 9 supreme court justices and three justices of the city court. Jonah J. Goldstein, however, was elected to the bench of the Court of General Sessions over the opposition of Tammany Hall. In Brooklyn, where there have been charges of corruption in the administration of justice, a Fusion candidate was nominated for district attorney in opposition to William O'Dwyer, the Democratic candidate. O'Dwyer, however, was elected and he announced that he would co-operate with those who have been inquiring into the charges of corruption. The conviction of James J. Hines, a Tammany leader, by District Attorney Dewey in Manhattan has had a wholesome effect upon the prosecuting officers in all the boroughs.

Among the public improvements completed during the year were an airport and a bridge across Newtown creek. The airport, which is at North Beach on Flushing bay in the borough of Queens, was dedicated on Oct. 15, 1939. It covers 558ac. and cost \$40,000,000, of which \$22,000,000 was contributed by the Works Progress Administration. It has four paved runways one of which is 6,000ft. long, and there is a landing stage for seaplanes on the shore of the bay. The Pan American Airways has leased part of the seaplane landing and plans have been made for the use of the port by aeroplanes of the Army, the Navy, and the Coast Guard as well as by privately owned planes. On August 23 the bridge across Newtown creek at Meeker avenue was dedicated. It connects the boroughs of Queens and Brooklyn with its two three-lane roadways. Streets have been opened connecting it with the plaza of the Brooklyn bridge and with the Queens boulevard in Queens, thus providing an uncongested route for through traffic. The bridge with its approaches cost \$13,194,399. The mayor advanced his housing program and perfected negotiations for the purchase of the privately owned rapid transit lines. He has built new health centres and new markets and has hastened work on a new reservoir to enlarge the available water supply. The reservoir is to be formed by damming Roundout creek in a valley in the southern slope of the Catskill mountains. It will cover about 10 sq.mi. and have a maximum capacity of 50,000,000,000gal., supplementing the Croton and Ashokan reservoirs which have a maximum capacity of 233,000,000,000. The water will be carried to the city through a tunnel dug under the Shawabgunk mountains and the Hudson river. The dam, 200ft. high, is to be completed in 1945.

The Hospital Council of Greater New York, appointed in 1935 to study all proposals for expansion of the hospitals in the city or proposals for any changes, reported on Nov. 19, 1939, in favour of spending \$2,967,000 for the reconstruction of Roosevelt hospital, and the merger of the Beekman street and Broad street hospitals, all three in Manhattan. A construction program costing \$2,100,000 for Lebanon hospital in the Bronx and the abandonment of the Trinity hospital in Brooklyn were recommended. An international fair in celebration of the 150th anniversary of the first inauguration of Washington was held in the summer attracting hundreds of thousands of visitors to the city. (G. W. Do.)

New York University.

New York University within the year 1939 has added to its plant a number of new buildings involving construction and equipment costs in excess of \$1,400,000. Two of the new buildings, a sani-

tary engineering laboratory on the institution's campus at University Heights and a public health laboratory at the Medical college in the Bellevue Hospital district, were erected by the city of New York on land contributed by the university for the purpose.

A new graduate Institute of Public Law and Administration has been established. Through support of the Alfred P. Sloan Foundation an Educational Film Institute has been created. A four-year curriculum combining liberal arts and technical courses as preparation for careers in the radio industry has been instituted. Two-year programs for the preparation of candidates for the police and fire protection services have been set up.

The enrolment of the university for the year 1938-39 totalled 47,525, the faculty numbered 2,167, and the operating budget approximated \$8,500,000. Gifts received during the year exceeded \$500,000. (H. W. Ch.)

New Zealand, Dominion of.

Area: Dominion proper 103,415 sq.mi.; other islands 519 sq.mi.; pop.: Dominion proper (est. June 30, 1939) 1,626,486 (Maoris 88,997); Cook and other Pacific islands (census 1936) 16,350. Chief towns (pop. est. April 1, 1939): Auckland (221,500); Wellington (cap. 175,900); Christchurch (135,000); Dunedin (82,800). Ruler: King George VI; governor-general: Viscount Galway; language: English; religion: Christian (1936 figures, excluding Maoris: Church of England 600,786; Presbyterian 367,855; Roman Catholic 195,261; Methodist 121,012).

History.—The year 1939 opened with a promise of unique progress in social legislation. Parliament had passed, before the general election in the preceding October, the Social Security Act, one of the most momentous pieces of social legislation in the history of New Zealand. It provided old age pensions of 30s. at 60 years of age for both sexes, and amongst other things conferred free medical and maternity benefits, and enlarged the State pensions. The new Social Security proposals automatically came into force on April 1, 1939. The year opened with another internal matter of moment. Shortly before the new year the New Zealand Government had announced the institution of import licences, giving the Government complete control of all imports. The reason was the diminution of sterling credits in London. It was held that this state of financial affairs was due chiefly to a "flight" of capital, the owners of which had been hostile to the Government's social régime, to repatriation of capital left in the Dominion when the exchange rate was raised, and to over-importing. The facts of the removal of capital were given by the finance minister and they were not refuted. There was much opposition to the "control" both in Britain and in New Zealand; but it was a vain endeavour.

The sterling position of New Zealand in London brought the finance minister, Walter Nash, to London early in May. His mission was to deal with "trade relations arising from the changed import situation for financial provision for defence, and to arrange for renewals of loans falling due on Jan. 1, 1940." Before he left for New Zealand, shortly before the outbreak of war, there had been arranged with the British Government satisfactory credits for British exports to New Zealand, for defence and ordinary commercial requirements, and terms had been come to for the renewal of the Dominion's £17,000,000 of loans falling due on Jan. 1, 1940.

An internal loan of £4,500,000 at 4% was floated on May 15, and was over-subscribed. The budget presented on August 1 imposed heavier taxation, but this was largely due to defence requirements. There was in the 1938-39 year a surplus of £800,000 which was greater than anticipated. Good progress was reported with the state housing scheme, the commitments up to Jan. 1, 1940, £10,000,000. Unemployment virtually ceased. An important move was made when the Government took over the control of the Reserve Bank "in conformity with its declared policy of taking control of the credit and currency of the country."

The war cloud hung heavily over the Dominion. Notwithstanding the exceptional political activity and economic reform New Zealand had definitely committed herself to aid, to the utmost extent of her resources, the defence of the British Commonwealth. Early in 1939 a British air mission went to New Zealand; heavy orders were placed in Britain for planes, and ground equipment was greatly extended. A Pacific Defence Conference—Britain, Australia and New Zealand—was held, and though proceedings were not divulged Mr. Savage afterwards announced it had been very successful and helpful and that similar conferences would be held periodically.

During the prime minister's illness, the Hon. P. Fraser became acting prime minister. When Britain on September 3 declared war on Germany, the New Zealand Government immediately followed suit at a midnight sitting, its action being later ratified by parliament. A conference of labour organizations entirely supported the Government. Five days after the outbreak of hostilities, the Government announced the decision to raise a force for defence purposes either at home or where required; recruiting began four days later, strength requirements being exceeded on the first day; and training began shortly afterwards. In London the High Commissioner, W. J. Jordan, was authorized to have New Zealanders in Britain enrolled in a special anti-tank battery, and in a few days 140 men were enlisted and put into camp. In New Zealand the Government offered Britain a voluntary commandeering of all her surplus produce, and this was accepted on an agreed basis. The value of this help from New Zealand can be gauged from the fact that in the World War (1914-18) the Dominion sent overseas to fighting fronts over 100,000 men, and was one of Britain's chief suppliers of meat, dairy produce and wool. Her capacity since then has greatly multiplied. Organizations were set up by the Government to foster the utmost production. Special war finance was provided by additional heavy taxation, the war requirements to the end of the financial year being assessed at £9,750,000, and £20,000,000 for the year. (H.T.B.D.)

Education.—(Dec. 31, 1938) Elementary: state schools 2,290; scholars 205,919; secondary: schools 40; scholars 14,000.

Defence Forces.—(expenditure from consolidated fund):

	Actual		Budgeted
	1937-38	1938-39	1939-40
Navy	£760,529	£835,331	£919,970
Army	529,632	706,753	1,594,468
Air Force	313,652	557,205	700,000

Banking and Finance.—Revenue, consolidated fund (1938-39) £36,582,046; expenditure, consolidated fund (1938-39) £35,772,678; budget estimate (1939-40) £38,243,000; public debt (March 31, 1939) £303,970,272; note circulation, active (Aug. 21, 1939) £11,730,370; reserve (in Reserve Bank, Aug. 28, 1939) gold £2,801,839; sterling £5,690,208; exchange rate: £N.Z.125=£100 sterling.

Trade and Communication.—Overseas trade (merchandise): imports (1938) £55,422,189; (Jan.-Aug. 1939) £36,440,000; exports (1938) £57,800,626; (Jan.-Aug. 1939) £44,438,000; re-exports (1938) £575,657. Communications and transport: roads,

suitable for motor traffic (March 31, 1938) 42,048mi.; railways, open to traffic (March 31, 1938) 3,323mi.; shipping (1938) entered 3,084,705 tons net; cleared 3,102,057 tons net; commercial air transport (1938): aircraft engaged 20; miles flown 1,759,984; passengers carried 60,967; mail and freight carried 472,100lb.; motor vehicles licensed: cars, taxis, etc. 218,870; trucks 52,380; buses 873; cycles 21,259; wireless receiving set licences 317,509; telephones, number of subscribers 155,038.

Agriculture and Minerals.—Values in New Zealand currency in 1937-38: agricultural £8,600,000; pastoral £40,700,000; and dairying, poultry £33,800,000. Production in 1938-39, in metric tons, wheat 151,431; wool 148,644; butter (export, 1938) 132,819; cheese (export, 1938) 81,814; coal (1938) 993,496; brown coal (including lignite, 1938) 1,264,146; potatoes 89,074; oats 47,261; barley 24,421; sheep (April 30, 1939) 31,897,091 head; cattle (Jan. 31, 1939) 4,564,948 head; gold (1937) 5,130 kilograms. (W. H. WN.)

Nicaragua, a Central American republic; language, Spanish; capital, Managua; president, Anastasio Somoza. The area is 49,000 square miles. No census of the country has been taken since that of 1920 which showed a total population of 638,119. Estimates made since that date vary widely, but, unofficial statements from official sources estimate "at least 850,000." The chief cities, with their respective populations (estimated in 1935) are: Managua, 61,679; León, 58,957; Matagalpa, 39,271; Granada, 27,120. The economic situation of Nicaragua continued to be difficult throughout 1938 and 1939 because of the decline in the price of coffee, its principal export. Some immediate improvement is expected in the near future as a result of a promised loan of \$2,500,000 from the Export-Import Bank of the United States. Meanwhile, efforts have been made to combat the rising cost of living through a program of increased Government salaries, control of the prices of essential foodstuffs, and a limit of profits from the sale of prime necessities. In addition, Government housing and public health programs have been instituted. In March 1939, a new constitution was adopted by a constituent assembly called for the purpose. The Assembly re-elected President Somoza for an eight-year term. In May, the president paid an official visit to the United States, and was met in Washington with a reception of unprecedented size. While there he engaged in discussion of a Nicaraguan canal, in addition to receiving financial aid for his country. Earlier in the year proposals made in the United States Congress attracted wide attention in Nicaragua, and the Nicaraguan Government attempted conversations with Costa Rica respecting use of the San Juan river, their common frontier, as part of such a canal. As a result of his mission, a commission of United States Army officers made an investigation of possible canal sites. In October and November, the nationalization of the Bank of Nicaragua and the National railways was begun.

Nicaragua has good external communication by water and by air, but communications within the country are limited. There are 171mi. of Government railway and an undetermined amount of short privately owned lines. The 900mi. highway system is being expanded, and by Aug. 1939, 245mi. of the Inter-American highway system had been constructed. Imports (textiles, machinery and foodstuffs) in 1938 totalled \$5,119,579, a slight decrease. Over half came from the United States, with Germany and Great Britain next. Exports (coffee, gold and bananas) were \$5,884,154, almost 20% less than in 1937. Of this total, the United States took 67.3%, with Germany second. The export commodities, and corn and beans for domestic consumption, are the principal products. The monetary unit is the córdoba, valued at 20¢ U.S. Primary education is free and compulsory, and in 1936 there were over 700 primary schools, with 44,000 pupils. (L. W. BE.)

Nickel. The world total nickel output, 90% of which was from Canada, rose to a new high record level in 1937, with 114,000 metric tons, against 57,000 tons in 1929, but dropped to 112,000 tons in 1938; preliminary figures indicate a new record high in 1939. Of the minor production, New Caledonia averages about 5,000 tons annually; Greece, Burma and Norway range from 1,000 to 1,500 tons; the Soviet Union started production in 1934, and increased to an output of about 2,000 tons; and Brazil, starting in 1933, reached 500 tons.

The United States has no primary nickel production, but turns out 100-500 tons yearly as a by-product in copper refining. The Canadian output dropped slightly in 1938 from its high record level of 102,000 metric tons in 1937 but recovered in 1939 to 103,000 tons.

World consumption was estimated at 112,000 metric tons in 1939, a new high record, an increase of 21% over 1938, and of 3% over 1937, the former high figure. This increase was attributed in part to improvement in heavy industry in the United States, and in part to the general speeding up of industry in Europe, incident to increased war demand. Consumption was distributed 60% in steels, 4% in cast iron and other ferrous alloys, 15% in non-ferrous alloys, 18% in Monel Inconel, and pure metal uses, and 3% in compounds and miscellaneous uses.

One of the centres of interest in the three-ring circus of war is the nickel deposits in the Petsamo district of northern Finland, on which a subsidiary of the International Nickel Co. has spent several million dollars, with the expectation of being ready for production by late in 1940 with a plant capacity of 1,000,000 lb. of nickel and 500,000 lb. of copper monthly. Nitrates. There are small deposits of nitrate-bearing earth or shale in China, Egypt, and Spain, which are locally used to a small extent for fertilizer, and an output of 6,000-8,000 tons of potassium nitrate in India, but the only natural nitrates exploited on an extensive scale are the caliche beds of northern Chile, which carry 10-25% of sodium nitrate, and which supplied the bulk of the world's nitrate requirements for a century. The maximum output attained was 3,238,000 metric tons in 1929, declining to 439,000 tons in 1933, with a recovery to 1,420,000 tons in the fiscal year 1937-38. Steady progress in the development of the synthetic processes was made during the war, and the natural nitrates industry dropped to a point where in 1928-29, according to the figures of the British Sulphate of Ammonia Federation, it furnished only 22% of the world supply, although this was the record year of Chilean output. The depression then took a heavy toll of the Chilean industry, while manufactured nitrogen suffered little, and in 1932-33 Chilean nitrate supplied only 7% of the world total nitrogen supply. Although the Chilean output has shown a heavy increase since 1932, synthetic production has expanded so rapidly that in 1937-38 the Chilean share of the world total supply had increased only to 8%. The synthetic plant capacity now available is far in excess of the total world demand for combined nitrogen. (G. A. Ro.)

Nobel Prizes. The following awards were made during the year 1939:

Physiological Medicine.—Gerhard Domagk of Germany for his discovery of prontosil. The 1938 prize, deferred until 1939, went to Corneille Heymans of Belgium for his research in the role of

the sinus aorta in breathing. Both awards were announced October 26.

Physics.—Ernest O. Lawrence of the University of California, U.S.A., for his work in atom-smashing and his invention of the cyclotron. This award was announced on November 9, as were the awards in chemistry.

Chemistry.—Divided between Adolph Butenandt of Germany and Leopold Ruzicka of Switzerland for their research in sex hormones. The deferred 1938 prize in chemistry was awarded to Richard Kuhn of Germany for his work on vitamins.

Literature.—Frans Eemil Sillanpää of Finland. The award was announced November 10.

The three German prize-winners all declined their awards. German citizens have been forbidden to accept Nobel prizes since the peace award for 1935 was given to the late Carl von Ossietzky. No peace award was made in 1939.

Norris-La Guardia Act: see LAW (CASE): Labour.

North Borneo: see BORNEO.

North Carolina, popularly known as the "Old North State" or the "Tar Heel State;" area, 52,286 sq.mi.; population according to the U.S. census of 1930, 3,170,276, estimated July 1, 1937, 3,492,000. Capital, Raleigh, 37,379; Charlotte, the largest city, 82,675. Of the State's population in 1930, 809,847 (25.5%) were urban; 918,647 (29%) Negroes; 2,251,629 whites; 8,788 foreign born.

History.—The year was characterized politically by unusual apathy and harmony and ended with an unprecedented number of prospective candidates for the gubernatorial contest of 1940. The regular biennial session of the legislature, Jan. 4-March 4, in response to the public demand for cleaner elections, repealed the absentee ballot law for primaries though not for general elections and restricted the use of markers and assistance to handicapped voters in primaries. It adopted the revenue act as a continuing or permanent measure, except as it may be changed by subsequent legislatures. To meet the issue of graduate and professional education for Negroes, the legislature authorized two State Negro colleges to establish graduate and professional courses in liberal arts, agricultural and technical fields, law, pharmacy, and library science; and in September this new policy was inaugurated in part. Without levying any new taxes, the legislature adopted the largest budget in the State's history, the chief increase in appropriations being made for the public schools.

Due to the absence of Federal control, the tobacco crop was of unprecedented size and brought low prices. The withdrawal of foreign buyers due to the war led to the closing of the tobacco markets for a time in September and October. In October the North Carolina tobacco farmers by a vote of over 90% joined with those of the other tobacco States in restoring Federal crop control for 1940; and in December the cotton growers of the State likewise voted by about the same percentage majority, along with those of the other cotton States, to continue Federal control of the cotton crop for 1940.

Important State officers were: Clyde R. Hoey, governor; Wilkins P. Horton, lieutenant-governor; Thad Eure, secretary of State; George Ross Pou, auditor; C. M. Johnson, treasurer; Clyde A. Erwin, superintendent of public instruction; Harry McMullan, attorney-general; W. P. Stacy, chief justice.

Education.—North Carolina maintains separate public schools for whites, Negroes and Indians, with minimum eight months' term and compulsory attendance from 7 to 13 years of age, inclusive. In 1937-38, there were 4,059 public elementary and 946 high schools, with 24,998 teachers and 881,874 enrolment, operated at a cost of \$29,151,402, about four-fifths of which was contributed by the

State Government. The State appropriation for 1939-40 is \$25,941,313. The State maintained three branches of the consolidated University of North Carolina at Chapel Hill, Raleigh and Greensboro, with an enrolment of 15,821 in 1938-39, as well as 12 standard and teachers' colleges (six for whites, five for Negroes, one for Indians). There were 41 private colleges for whites and Negroes. There were 9,565 prisoners in the State prison and various road camps on July 1, 1939; and in August, 33,555 aged persons and 21,064 dependent children received public grants, averaging \$9.59 and \$5.91 per capita, respectively.

Banking and Finance.—In 1938-39, State expenditures were \$142,320,083; receipts \$144,644,358. The assessed value of real and personal property was \$2,311,858,768 in 1938. The State bonded debt was \$152,658,500 on June 30, 1939. There were 41 national banks with deposits of \$99,345,000 and 186 State commercial and industrial banks and trust companies, with \$220,130,000 on June 30, 1939. In 1939 there were 4,751 mi. of railroads, 316 mi. of city bus routes, 6,176 mi. of passenger vehicle routes, and 6,566 mi. of freight vehicle routes; and the State Highway and Public Works Commission maintained 11,232 mi. of State highways and 47,902 mi. of county roads, of which 10,595 mi. were hard surfaced. Federal internal revenue collections of \$326,920,750 in North Carolina in 1937-38 were exceeded only by those in New York, Illinois and Pennsylvania.

Agriculture, Manufactures and Mining.—In 1937, 2,896 manufacturing establishments employed 258,771 wage earners at wages of \$189,266,474 and made products valued at \$1,384,737,686. The leading industries were tobacco, cotton goods, knit goods and furniture. The mineral production in 1938 was valued at \$11,160,444, chiefly granite, sand and gravel, feldspar, mica and ceramics; the kilowatt-hour production of electricity was 2,186,310,000. The total acreage of United States lands in national forests in the State was 927,398 in 1939. The value of the lands and buildings on the 300,967 farms in North Carolina in 1935, approximately half of which were operated by tenants, was \$622,834,983. In 1939, the total value of the 20 major crops increased 8% over that in 1938 to \$231,502,000, of which tobacco, cotton and peanuts accounted for \$156,988,000. For the first time in history, the acreage of tobacco exceeded that of cotton. Tobacco increased 50% in production to 773,810,000 lb. but only 4% in value to \$121,010,000.

Cotton production increased from 388,000 bales in 1938 to 445,000 in 1939 with a value of \$25,804,000.

BIBLIOGRAPHY.—*Public Laws of North Carolina* (1939); *Blue Book of Southern Progress* (1939). (A. R. N.)

North Dakota, North-central State of the United States and popularly known as the "Flickertail State," has an area of 70,837 sq. mi. and a population of 706,000 (estimated July 1, 1939). The capital is Bismarck, population 11,090 (1930). Cities with larger population are: Fargo, 28,619; Grand Forks, 17,112; and Minot, 16,099. Of the population of the State (680,645 in 1930), 113,306 were urban, or 13.6%; 680,477 were white; 368 coloured; 576,058 native born; and 105,155 foreign born.

History.—Principal officers of the State are: United States Senators, Lynn J. Frazier and Gerald P. Nye; Representatives in Congress, Wm. Lemke and Usher L. Burdick; governor, John Moses; lieutenant-governor, Jack A. Patterson; secretary of State, James D. Gronna; State auditor, Berta E. Baker; State treasurer, John R. Omland; attorney-general, Alvin C. Strutz; commissioner of insurance, Oscar E. Erickson; commissioner of agriculture and labour, Math Dahl; commissioner of railroads, Elmer W. Cart; superintendent of public instruction, Arthur E. Thompson; judges of the State supreme court, W. L. Nuessle, chief justice; A. M.

Christianson, A. G. Burr, James Morris, Thomas J. Burke.

Education.—The institutions of higher learning are the State university and school of mines, Agricultural college, three State Teachers' colleges, two normal schools, the school of forestry and the school of science. The total enrolment in these schools was approximately 8,000. The institutions of higher learning are under the unified control of a Board of Higher Education composed of seven members appointed by the governor from a list furnished by an ex officio nominating committee.

Banks.—On June 30, 1939, 121 State banks and one trust company operating within the State of North Dakota, reported invested capital, including \$907,700 debentures held by the Reconstruction Finance Corporation, of \$4,220,107.19 and total resources of \$27,082,499.31. On September 28, 1938, latest date for which information is available, 51 national banks operating within the State of North Dakota, reported a total invested capital of \$5,452,000, which amount included preferred stock held by the Reconstruction Finance Corporation, and total resources of \$52,710,000.

Agriculture, Manufactures and Minerals.—In 1939 there were (estimated) in the State 23,930,032 ac. under cultivation valued at \$521,000,000. The farm income of the State, 1939 (estimated), was \$218,330,652. During 1939 the State produced 43.3% of the national production of spring wheat, 10% of the national flax yield, and 79.3% of the national production of durum wheat. The State ranks first in the amount of wheat stored under Federal loan, 26,811,963 bushels. In the national production of certified seed potatoes the State ranked second with 1,717,571 bu.; the total State production of potatoes was 11,880,000 bushels. In 1938 the amount of lignite coal mined was 2,142,061 tons, valued at \$2,600,643.42. (O. G. L.)

Northern Ireland: see IRELAND, NORTHERN.

Northern Rhodesia: see RHODESIA.

Northern Territory, of Australia; area 523,620 sq. mi.; pop. (June 30, 1938): Aborigines, full-blooded, 14,354; half-caste, 907; white (est. Dec. 31, 1938), 5,645.

History.—The recommendations of the Payne Report, which was published at the end of 1938, were adopted as the basis of a new policy, announced by the Commonwealth Government early in 1939 for the economic development of the Territory. This policy aims at the provision of improved transport services, and of facilities for assisting settlers to develop their holdings. Taxation of income has been abolished for 10 years. It was announced in July that about 250,000 sq. mi. of cattle country would be subdivided into sheep runs of 100-200 sq. mi. as soon as the present leases expire.

The growing importance of Darwin as a port of call for the Empire air services and as a defence base led to considerable development there. Work commenced in Feb. 1939 upon improvements which will include the construction of a new aerodrome and flying boat base and the provision of up-to-date hotel and housing accommodation. (L. R. Mc.)

Finance.—Revenue (1938-39) actual £70,378; (est. 1939-40) £60,000; from Central Australia railway (1938-39) £137,521; from North Australia railway (1938-39) £50,471. Expenditure, ordinary appropriation (1938-39) £402,899; (est. 1939-40) £456,750; new works, buildings, etc. (1938-39) £243,980; (est. 1939-40) £388,000; Central Australia railway (1938-39) £214,374; (est. 1939-40) £202,300; North Australia railway (1938-39) £55,186; (est. 1939-40) £52,960.

Agriculture, etc.—Production in 1937-38; pastoral industry £560,763; gold £93,248; pearl shell £67,000. Railways, Government (Dec. 31, 1937) 508 miles.

Northwestern University was chartered in 1851 as an institution of higher learning. The enrolment of the university for the first semester of 1939-40 consisted of 5,986 full-time students, of which 4,795 were registered on the Evanston campus; and 10,093 part-time and evening students, of which 9,749 were registered on the Chicago campus. The 1939 summer session had an enrolment of 4,579 students.

During the calendar year of 1939, the university received gifts totalling \$8,968,104. The budget for the year 1939-40 totalled \$5,100,000 and the value of all land and buildings used for educational purposes was \$16,930,267. The faculty of the university, including lecturers and demonstrators, totalled 1,475, of whom 688 were full-time members. The university's productive endowment amounted to \$23,062,038.

One of the most important developments during the year was the establishment of the Northwestern Technological Institute, made possible by a gift of \$6,735,000 from the Walter P. Murphy Foundation. Construction is now proceeding on two new buildings: Abbott Hall, a \$1,500,000 18-story dormitory on the Chicago campus; Scott Hall, a \$650,000 student social centre and auditorium on the Evanston campus. Both of these buildings will be completed by Sept. 1, 1940. Plans for two additional buildings on the Evanston campus are now being made, and construction will begin in the early spring of 1940: a new gymnasium to cost \$425,000; the new building of the Technological institute, which will cost approximately \$5,000,000.

Several administrative changes have occurred during the year. Dr. Franklyn B. Snyder became president of the university on Sept. 1, 1939, succeeding Dr. Walter Dill Scott who had been president since 1920. Three new deans were appointed: Dr. Ovid W. Eshbach of the Technological institute, Dr. Homer Vanderblue of the School of Commerce and Dr. Fred D. Fagg, Jr. as dean of faculties.

Northwest Territories embrace all of the mainland, in Canada east of Yukon Territory and north of the Provinces of Manitoba, Saskatchewan, Alberta and British Columbia; all of the islands in Hudson and James bays and in Hudson strait including Ungava bay; and all of the Arctic islands north of the mainland of Canada within the area bounded on the east by a line passing midway between Greenland and Baffin, Devon and Ellesmere islands, to and along the 60th meridian of longitude, to the North Pole, and on the west by the 141st meridian of longitude, to the Pole. In 1918, the territories were subdivided, for administrative purposes, into the provisional districts of Mackenzie, Keewatin and Franklin. The land and water area is estimated at 1,309,682 square miles. The 1931 census shows a population of 9,723, composed of Eskimos, Indians and whites, but as a result of mining activity in recent years the white population has more than doubled.

History.—The Northwest Territories are governed by a Territorial Council composed of a commissioner, deputy commissioner, and five councillors appointed by the Governor General in Council. The Commissioner in Council has power to make ordinances for the government of the Territories under instructions from the Governor General in Council or the Minister of Mines and Resources. The seat of Government is at Ottawa.

Trade and Communication.—The welfare of the native population is one of the chief responsibilities of the administration. Consequently the conservation of the wild life of the region, upon which the natives depend for subsistence, is of prime importance. An aggregate area of 609,277 sq.mi. has been set aside for game preserves and sanctuaries. Licences to hunt and trap outside these preserves may be granted to white residents who are British subjects and who held licences on May 3, 1938.

Mining.—Mining of high grade pitchblende-silver deposits at Great Bear Lake continues and ore reserves have been increased. Ore is refined at Port Hope, Ontario. Further gold discoveries have been made in the Yellowknife area, where actual production commenced by the pouring of a gold brick on Sept. 5, 1938, from the "Con" property followed by the pouring of a brick on Feb. 21, 1939, from the "Negus" property in the same locality. More than 7,500 mineral claims were in good standing throughout the Territories on Oct. 1, 1939. (R. A. G.)

Norway, area 124,556 sq.mi.; pop. (est. Dec. 31, 1938) 2,921,000. Chief towns (pop. 1930): Oslo, capital, 253,124; Bergen, 98,303; Trondhjem, 54,458; Stavanger, 46,780. Ruler: King Haakon VII; prime minister: Johan Nygaardsvold; language: Norwegian; religion: Christian (Evangelical Lutheran).

History.—On Jan. 14, 1939, the annexation by Norway was announced of new Antarctic land consisting of that part of coast stretching from the border of the Falkland Islands dependencies in the west to the border of the Australian Antarctic dependency in the east—that is, between 20° W. and 45° E.—together with the land within this coast and its territorial waters. The value of this territory lies in its great importance for the whaling industry.

The resignation of the finance and commerce ministers, Hr. Bergsvik and Hr. Madsen, necessitated a reconstruction of the cabinet on June 30. The former minister of justice, Hr. Lie, took the portfolio of commerce; Hr. Torp exchanged that of social affairs for that of finance; and two Social-Democrats, Judge Wolv and Hr. Stöstad, took over the portfolios of justice and social affairs respectively.

A full measure of the anxiety occasioned by the international situation had to be borne by Norway. In March the president of the Storting, in emphasizing the nation's neutrality, made it clear that she did not require guarantees from any of the great Powers; and when, as a consequence of President Roosevelt's letter to Hitler and Mussolini, Germany asked whether Norway considered herself threatened by her, the foreign minister replied in April that she did not, and that she had neither authorized nor requested President Roosevelt's message; but he added that Norway realized that, if a European war should break out, she would be in danger. A meeting of the prime ministers of Norway, Sweden and Denmark was held on June 18 at Halden, at which the possibility of an economic union of the three countries was considered, but abandoned on the representations of Denmark. After the outbreak of war, the King addressed an extraordinary session of the Storting, on September 8, declaring that the country would remain absolutely neutral. During the rest of the year Norway was concerned

NORWAY: Industrial production (*The Annalist*)

about the repeated sinking of her merchant vessels by German action. She vindicated her neutrality in the episode of the United States steamship "City of Flint," which was released on Nov. 3 by the Norwegian authorities after she had anchored without permission at Haugesund in charge of a German prize crew; the German crew were interned. In November, Norway strongly protested against the British reprisals against German mine-laying methods. The close of 1939 was made increasingly anxious by the fear of Russian invasion following that country's attack upon Finland.

(E. A. ASH.)

Education 1936-37.—Elementary, total number of scholars 357,793; secondary schools 149; scholars 32,101; universities and higher schools, students 5,518.

Banking and Finance.—Revenue, ordinary (est. 1939-40) 556,900,000 kroner; expenditure, ordinary (est. 1939-40) 529,009,000 kroner; public debt (June 30, 1938) 1,428,700,000 kroner; notes in circulation (Aug. 31, 1939) 505,000,000 kroner; gold reserve (Aug. 31, 1939) 236,000,000 kroner; exchange rate (Sept. 1, 1939) 18½-19¼ kroner=£1 sterling.

Trade and Communication.—Foreign trade (merchandise): imports (1938) 1,192,650,000 kroner; (Jan.-Aug. 1939) 820,510,000 kroner; exports (1938) 786,529,000 kroner; (Jan.-Aug. 1939) 506,080,000 kroner. Communications and transport: roads, suitable for motor traffic (1938) 25,713 mi.; railways, open to traffic, State (1938) 2,377 mi.; shipping (June 30, 1939) 4,835,000 gross tons; motor vehicles licensed (Dec. 31, 1938): cars 51,066; taxis 4,210; buses 3,233; trucks 32,272; cycles 16,876; wireless receiving set licences (Jan. 1, 1939) 364,550; telephone subscribers (Dec. 31, 1938) 119,344.

Agriculture, Manufactures, Mineral Production.—Production 1938 (in metric tons): sea fisheries (1937) 1,012,000; iron ore (metal content) 1,030,000; oats 196,700; (1939) 183,200; barley 124,300; (1939) 126,700; wheat 71,800; (1939) 69,400; potatoes 937,600; coal (Spitzbergen 1937) 766,000; pig iron and ferro-alloys 174,000; whale oil (season 1937-38) 198,000; wood pulp 887,000; copper ore (1937) 30,700; rye 11,000; (1939) 10,400; shipbuilding, tonnage launched 53,000 gross tons; under construction (July 1, 1939) 43,000 gross tons; nitrates of soda and lime (1937) 431,000. Industry and labour: industrial production (1929=100) (average 1938) 127.2; (average June 1939) 139.1; index of employment (1935=100) (average 1938) 109; (June 30, 1939) 114; unemployed, number registered (average 1938) 28,923; (June 30, 1939) 20,802.

Notre Dame, University of. Outstanding research in the field of economics in 1939 was the work of the Bureau of Economic Research under Rev. Edward Keller, C.S.C. First publication of the bureau, "A Study of the Physical Assets of the United States, Sometimes Called Wealth," attracted wide attention. Also published was a study of the physical assets of the State of Indiana, compiled by James E. McCarthy, Dean of the College of Commerce. A micrurgical colloquium at Notre Dame in November brought to the attention of a national delegation of scholars in the field the great development at Notre Dame in the application of germ-free technique to medicine, bacteriology and general biology. It was led by Prof. James A. Reyniers, equipment was demonstrated, and some of the early results revealed, emphasis being placed on germ-free cubicles for infants, which have successfully prevented disease.

The Knute K. Rockne memorial, devoted to intra-mural athletics and the program of physical education, for all students, was dedicated in June.

A competition, conducted by the Notre Dame department of

CROWN PRINCE OLAF and Crown Princess Martha of Norway visited the U.S.A. in the spring of 1939

architecture, produced interesting designs for the construction of small churches at low cost especially in mission districts. Laetare Medalist for 1939 was Miss Josephine Brownson, president of the Catholic Instruction League of Detroit, whose father, Henry Brownson, received the medal in 1892. New dean of the College of Engineering is Prof. Dugald C. Jackson, Jr., formerly president of Lewis institute. Enrolment for 1939 was 3,279. The year 1939 was the 97th year of the university.

(J. E. AR.)

Nova Scotia, one of the original provinces of the Dominion of Canada; area 21,428 sq.mi.; population, according to the Canadian census of 1931, 512,846, estimated Jan. 1, 1940, 548,000. Capital, Halifax, 59,275. The only other city in the Province is Sydney, 23,089, which is the centre of the coal, iron and steel industries. Of the Province's population, 281,192 are rural or 55%; 507,235 are Canadian born or 97%.

Nova Scotia has a system of free schools and the law provides for the compulsory attendance of children. Text-books are provided free of charge and, in many cases, free lunches are provided. The enrolment in the public day schools is (1940) 116,656; in private day schools 2,977. The number of people who can neither read nor write is 4.26% of the population. There are four universities in the Province: Acadia, having an enrolment of 520 students; the University of King's College, with an enrolment of 65; Dalhousie, with an enrolment of 854, and St. Francis Xavier, with 307 students. King's college is affiliated with Dalhousie. In addition there are an agricultural college and a normal school, both of which are financed by the Provincial Government.

The Liberal Government continued in office with the Hon. A. L. Macdonald, premier, provincial secretary and treasurer of the Province. The lieutenant-governor, who is appointed by the Dominion Government, is the Hon. Walter H. Covert. Nova Scotia is represented in the Dominion House of Commons by 12 members, all of whom belong to the Liberal Party, and in the Dominion Senate by 10 members who are appointed for life.

The net value of production in 1936 was \$89,823,005, an increase of 7% over the preceding year. The net value of agricultural products for the same year was \$16,195,664, a slight increase over the preceding year. The net value of forest products was \$8,537,693; fish and fish products, \$8,202,308; mining products, \$19,108,641; manufactured products, \$27,788,510, a slight decrease in comparison with the preceding year.

Nuts. The Mediterranean basin almond crop for 1939 was estimated at 50,000 short tons (shelled), the smallest production since 1929 and comparable to 75,100 short tons (shelled) in 1938.

The United States (California) crop of almonds was 18,700 tons in 1939 and 15,000 tons in 1938, the ten-year average (1928-37) being 12,170 tons.

Table I. Almond (shelled) Production in Mediterranean Basin, 1938 and 1939

	1939 short tons	1938 short tons
Spain	23,000	24,000
Italy	15,000	44,000
Portugal	7,000	3,500
French Morocco	4,800	3,100
France	200	500

The largest nut crop in the United States, walnuts, was estimated Nov. 1, 1939, by the Department of Agriculture as 58,200 tons, of which 53,900 tons was in California and 4,300 tons in Oregon. The 1938 crop was 45,300 tons in California and 5,500 tons in Oregon. The Oregon yield of filberts was 3,120 tons in 1939 and 1,860 tons in 1938; in Washington 590 tons in 1939 and 380 tons in 1938. Pecans, the most widely grown commercial nut crop in the United States, produced in 1939 60,474,000lb., of which 22,281,000lb. were improved varieties and 38,193,000lb. wild or seedling.

The 1938 crop was 17,504,000lb. of improved varieties and 32,217,000lb. of wild or seedling varieties.

Table II. Pecan Production of 12 States in 1939

	Improved varieties lb.	Wild or seedling lb.		Improved varieties lb.	Wild or seedling lb.

Ocean Liners: see SHIPBUILDING; SHIPPING, MERCHANT MARINE.

Oceanography. It is quite evident that the European war will have a serious effect on oceanographic research. Already the field work has been radically curtailed and such organizations as the International Council for the Exploration of the Sea and the North American Council for Fisheries Investigations are finding it difficult to continue their functions

SEVEN MILES OF STEEL ROPE, equipped with a core sampler and powder charge, were completed early in 1939 at the Carnegie Institute of Washington to plumb ocean floors for scientific data previously unknown to man

as mediums for the exchange of observations and ideas. The chief exception to a world-wide decrease in oceanographic activity is the recent announcement that the United States Bureau of Fisheries has made arrangements for the reconditioning of a trawler to study off-shore fisheries problems in the New England area.

Ocean Currents.—In Sept. 1939 the physical oceanographers attending the Washington meeting of the International Union of Geodesy and Geophysics reported on a number of interesting developments. The survey carried out, May–July 1938, in a restricted area north-west of the Azores by German and Norwegian ships indicates that even quite minor features of the bottom topography can influence the superficial current pattern in depths as great as 1,500 fathoms.

Both on the Atlantic and the Pacific coasts of the United States the tide gauge records have recently been studied in relation to fluctuations in the current systems along the coast. It has been found, for example, that the variations in the transport of the Gulf Stream are rather closely reflected by changes in mean sea-level at Miami and Charleston. There is a possibility that in some circumstances tide gauge observations may become helpful in forecasting the gradual trends in coastal climate.

In addition, there is some evidence to show that the success of certain fisheries depends largely on whether or not the current system disperses the eggs. When the currents are abnormal, many of the very young fish are carried off to deep water where they have little chance to survive. Thus a better knowledge of the variations in the currents is essential to fisheries investigations.

Plankton.—The floating population of small marine animals and plants are of course studied for their own sake, but during 1939 they also received attention for other reasons. Investigated quantitatively, the plankton provide information concerning the fertility of the sea. It has been found, for example, that although tropical waters are relatively sparsely populated, the total annual plankton crop may exceed that of northern coastal areas, which for short periods are often so extremely fertile that the waters

become discoloured by the swarms of tiny creatures. There is a much longer growing season in low latitudes and the better penetration of sunlight permits plants to flourish over a considerable depth range. The plankton are also successfully being used for a study of the currents in the North sea and the English channel. The various primary water-masses, which are mixed in this region, each have a characteristic population. Thus marine biologists, by counting the numbers of certain indicator forms in each haul of a two-net survey, are able to gain information on the mixing which accompanies the rather complicated current system.

Submarine Geology.—The use of continuously recording sonic sounding equipment is bringing to light many interesting details of the bottom topography. Recently published charts of the continental shelf off the eastern coast of the United States not only adequately map the huge submarine canyons at its off-shore edge, but also show that the whole face of the continental slope has been eroded, presumably at the same time that the canyons were formed. (See also FISHERIES; MARINE BIOLOGY; ZOOLOGY.)

Ogilvie, Albert George (1891-1939), premier of Tasmania, was born at Hobart, Tasmania, on March 10. He received his degree of bachelor of laws from the University of Tasmania and was called to the bar in 1914. After building up a large practice he entered parliament in 1919 as a Labour member. Four years later he became attorney-general and minister of education in the Labour cabinet; in the same year he also held the portfolios of forestry and of mines. He became leader of the Tasmanian Labour Party in 1929 and was premier of Tasmania from 1934 until his death on June 11 at Warburton, Victoria, Australia.

Ohio, north central State of the United States, popularly known as the "Buckeye State"; area, 41,040 sq.mi.; population (1930 census), 6,646,697, estimated July 1, 1937, 6,733,000. Capital, Columbus, with a population of 290,564 (1930). Other cities with over 100,000 were: Cleveland, 900,429; Cincinnati, 451,160; Toledo, 290,718; Akron, 255,040; Dayton, 200,982; Youngstown, 170,002; and Canton, 104,906. Of the State's population, 4,507,371 were urban, or 67.8%; native white 5,686,985; foreign born 644,151; and coloured, 309,304.

History.—An unemployment relief crisis and the efforts to fix the responsibility for it focused national attention on Ohio in the last two months of 1939. The General Assembly on May 26 enacted a \$317,000,000 budget for the 1939-40 biennium. Relief authorities and the large cities had asked that \$26,000,000 be voted for unemployment relief for the two-year period but when it was enacted the budget allotted only \$20,000,000 for that purpose or \$10,000,000 a year. Industrial employment was expanding and \$10,000,000 might have covered the relief needs except that the Federal Government at the order of Congress made drastic

cuts in the rolls of those holding Works Projects Administration jobs. So the number of persons on relief rose although industrial hiring increased.

In the last quarter of 1939 Toledo and Cleveland, industrial centres, found their relief funds at the vanishing point. They appealed to Gov. John W. Bricker to call a special session of the legislature so that additional funds might be voted. This the governor refused to do, holding that the cities had not done everything in their power to remedy the situation. He charged that political manipulation of WPA was partly responsible for Cleveland's difficulty and pointed out that at a special election in Toledo in September a relief levy was defeated, with only 11,622 persons voting in favour of it although there were 11,204 cases or nearly 33,000 people on the relief rolls. The governor's stand and his charges of WPA political manipulation brought heated retorts from President Roosevelt, Secretary of the Interior Harold L. Ickes and Col. Francis C. Harrington, Works Projects commissioner. By transferring funds intended for other purposes and with temporary help from Federal agencies, the cities were able to take care of the most desperate cases of need.

Ohio voters rejected decisively at the election November 7 a proposal to pay every person over 60 years of age a pension of \$50 a month regardless of need. Revenue was to be raised by a special land tax and a State income tax. The vote was 460,537 for and 1,527,577 against. This proposed amendment to the Ohio Constitution and another designed to make it easy for minorities to get other constitutional amendments and initiated laws on the ballot were sponsored by Herbert S. Bigelow. The vote on the initiative amendment was 403,749 for and 1,469,796 against.

Two other State issues were voted down at the same time. A constitutional amendment to establish a State Board of Education lost, 739,082 for and 1,118,704 against. The vote on a referendum bill to reorganize the State Civil Service Commission was 645,096 for and 1,110,471 against. Over the State, proposed bond issues and tax levies were voted down by the scores with school levies in general faring better than the others.

Gov. Bricker on August 26 appointed a Democrat, former Adjt.-Gen. Frank D. Henderson, warden of Ohio penitentiary. Henderson succeeded James C. Woodard who was dismissed on March 25 on charges of favouring prisoners with wealthy or political connections and of permitting prison traffic in narcotics and liquor.

Opposition of residents of the 18-county Muskingum Watershed Conservancy district to increased taxes and assessments on benefited property induced the Federal Government to add to its original grant of \$22,090,000 toward the \$45,000,000 flood control project. When this additional contribution was made in 1939 management of the project was vested in the United States Army Engineers. Residents of the district then expressed the fear that under Federal control the development of recreation and wildlife conservancy programs that were originally contemplated around the 14 key dams would be neglected.

Effectiveness of Ohio's 3% sales tax was increased in May when the State began redeeming sales tax coupons for 3% of their face amount when submitted in amounts of at least \$100 face value. During the first six months this plan was in operation \$66,365 was paid out for coupons which had a total face value of \$2,212,185 and represented purchases of \$73,739,503. This system coupled with improved business conditions produced sales tax revenue for the first 10 months of 1939 that was nearly \$4,500,000 in excess of the revenue for the corresponding period in 1938.

Education.—After Toledo voters defeated a school tax by a two-to-one majority at the November 7 election, the city was forced to close the schools for the last six weeks of 1939 because it lacked funds to pay teachers and other employees. (P. By.)

Agriculture, Manufactures, Mineral Production.—Important crops, with provisional figures of production for 1939, are as follows: corn, 167,825,000bu.; soybeans, 7,854,000bu.; apples, 5,800,000bu.; tobacco, 28,160,000lb.; potatoes, 12,626,000bu.; wheat, 36,669,000bu.; oats, 35,490,000bu.; barley, 1,050,000bu.; tame hay, 3,487,000 tons. Corn in 1939 reached a record estimated yield of 49bu. per acre. Manufactures in 1937 were valued at \$5,099,816,893, with steel products, rubber tires, electrical machinery and motor vehicles leading. Total mineral output in 1937 was valued at \$131,025,104. Principal minerals were coal (\$44,313,000), clay products (\$24,329,083), natural gas (\$19,967,000), stone (\$9,426,808), coke (\$32,185,945), lime (\$8,653,571) and pig iron.

Oklahoma, the forty-sixth State of the United States, and popularly known as the "Sooner State," has a total area of 70,057 square miles. The population in 1930 was 2,396,040 (estimated July 1, 1937, as 2,548,000). The capital and largest city is Oklahoma City, population 185,389 (estimated, 1939, 225,000); the second largest city is Tulsa, 141,258 (estimated 160,000). Of the State's population, 821,681 were urban, or 31%; 2,095,671 were native white; 26,753, foreign-born white; 172,198, coloured; and 92,725, Indian.

History.—The year 1939 opened with the inauguration on January 9 of Leon C. Phillips as 11th governor. The 17th legislature remained loyal to the new governor and the session ended with little change in the way of taxation or increased appropriations. The heavy debt of the State has been constantly criticized by the governor and steps have been taken in an attempt to bring about a more economical State Government. In August the State forced all oil production to cease and for two weeks all State wells were shut down. The situation came as a result of similar action taken in Texas and was widely heralded as a price-fixing scheme. However, State officials stoutly maintain that production exceeded the market demand and that the purpose was conservation as State statutes define any production of oil over market demand as waste.

On the educational scene, strife appeared between the governor and the State department of education over issuance of the \$11,000,000 common school fund. In addition, control of the State teachers colleges was wrested from the State board of education and placed in the hands of a college board of regents. As a result of laws passed by the 17th legislature the so-called teachers colleges were changed to State colleges and in many instances changes were made in the administration of the schools. At present, the governor has the power to approve all institutional budgets by the quarter and to make any recommendations he feels are necessary for the economic stability of the State.

Education.—The educational institutions include the University of Oklahoma, Norman; Oklahoma Agricultural and Mechanical college, Stillwater; Panhandle Agricultural and Mechanical college, Goodwell; Oklahoma College for Women, Chickasha; Colored Agricultural and Normal university, Langston; six State colleges, formerly teachers colleges; four secondary agricultural schools; three junior colleges; with six independent senior colleges, and three independent junior colleges. There are 19 municipal junior colleges and 868 approved high schools. Elementary and high school district average daily attendance, 1939, was 497,120.

Charities and Corrections.—The hospital and eleemosynary institutions include three white mental hospitals located at Norman, Vinita and Supply; two tubercular hospitals at Clinton and

Talihina; two orphan homes at Helena and Whitaker; school for the deaf, Sulphur; school for the blind, Muskogee; Deaf, Blind, and Orphans' Home for Coloured Children, Taft; and the State Hospital for Negro Insane, Taft. The penal and corrective institutions include the State penitentiary at McAlester; Oklahoma State reformatory, Granite; Training School for White Boys, Pauls Valley; State Industrial School for White Girls, Tecumseh; and training schools for Negro boys at Boley and for Negro girls at Taft.

Banking and Finance.—Of the 77 counties, 69 are in the 10th (Kansas City) Federal Reserve District and eight in the 11th (Dallas) District. There are 182 banks under State supervision and 212 national banks. In 1939, 380 banks carried Federal Deposit Insurance and 14 did not. Bank deposits averaged \$445,396,000 during 1937. State expenditures for 1939-40 were estimated at \$100,000,000. There is (Jan. 1, 1940) no State ad valorem tax, the main source of revenue being a gasoline tax, a sales tax (2%), a production tax, and an income tax. The funded State debt stood at \$25,622,681 in July 1939. (Estimated debt, July, 1940, \$32,600,000.)

Agriculture, Manufactures, Mineral Production.—The chief agricultural commodities are wheat, cotton, corn, grain sorghums, and broom corn. The total value of agricultural products for 1939 was \$115,040,000 compared with \$110,312,000 in 1938 (a 4% increase). Wheat with a value of \$37,472,000 ranked first in 1939. The value of cotton and cotton seed was \$25,934,000. The 1939 season average prices of most crops was above that of 1938. The principal mineral products are petroleum, coal, lead and zinc, gypsum and asphalt. There is a known reserve of 3,500,000,000bbl. of petroleum and in 1939 there was a total production of 153,349,000bbl. of crude oil. In 1939, there were produced 1,062,212 tons of coal, 100,957 tons of lead and zinc, 98,264 tons of gypsum, and 51,254 tons of asphalt. The chief manufacturing interests are glass, cement, flour, brooms, bricks and all types of refinery products. The total value of manufactured products in 1935 was \$282,658,470. (R. GRT.)

Oliphant, Herman (1884-1939), U.S. fiscal expert, was born in Forest, Ind., on August 31. He took his bachelor's degree at Indiana university in 1909 and his doctorate of jurisprudence at the University of Chicago five years later. Meanwhile he was instructor of English at Marion college in Indiana. From 1914 to 1921 he taught law at the University of Chicago, and from 1921 to 1929 he was professor of law at Columbia university. In 1929 he helped organize the Institute of Law at Johns Hopkins university, where he assisted in the preparation of many notable surveys of judicial systems and litigation in the United States. Henry Morgenthau, Jr. invited him to Washington in 1933 to act as his legal counsel in the new Farm Credit Administration. After Morgenthau became Secretary of the Treasury on Jan. 1, 1934, he appointed Oliphant general counsel of the Department of the Treasury. This position he held until his death in Washington on January 11. Oliphant became widely known during Roosevelt's second administration as author of the ill-fated undistributed profits tax.

Ontario, one of the original provinces of the Dominion of Canada; area, 412,582 sq.mi.; population according to the Dominion census of 1931, 3,431,683, estimated Jan. 1,

1940, 3,731,000. Capital, Toronto, 631,207. Of the Province's population 2,095,992 are urban, or 61%; 2,794,631 native born or 81%.

Much attention has been directed to the policy of the Government of Ontario in supplying cheap light and power to the people of the Province through the publicly owned and controlled Hydro-Electric Power Commission. The Commission provides electric services to 782 municipalities, comprising nearly all of the cities and towns in the Province as well as many small communities and local areas. The actual distribution within a municipality is performed by the municipality itself, under the supervision of the Commission. The capital of the Commission and Municipal Utilities amounts to \$424,422,000. reserves \$184,016,209. Rates are low and the service is excellent. The net value of the total production of the Province in 1936 was \$1,183,844,782. an increase of 10% over the preceding year. The net annual agricultural revenue in 1936 was \$234,619,984; of mineral products for 1936, \$151,874,462. The net value of forest products was \$58,390,676; of manufactured products \$686,470,917.

The provincial election of 1937 resulted in the return to power of the Liberal Party under the leadership of the Hon. Mitchell Hepburn. The party standing of the Provincial Legislature comprises 63 Liberals, 23 Conservatives and 4 Independents. The lieutenant-governor is the Hon. Albert Matthews. Ontario is represented in the Dominion Parliament by 24 senators, appointed for life and 82 members of the House of Commons elected for a term of five years or less.

Oranges. Bumper crops and a market disrupted by war were the lot in 1939 of the orange section of the citrus fruit industry, which, as a whole, has had the largest expansion of any branch of agriculture in the last 20 years. Exports of oranges from Spain for the season ending Oct. 31, 1939, were 2,572,000 half cases, compared to 3,243,000 half cases for the 1938 season. The five-year average (1933-37) was 10,479,000 half cases. Orange groves of Spain were less damaged "than would be supposed," official advices report. Orange exports from Egypt for the season ending March 31, 1939, were 729,000 boxes, compared to 341,000 boxes in the preceding season. The United States orange crop in 1939 was estimated by the Department of Agriculture as 78,564,000 boxes. In 1938, the record high, it was 78,863,000 boxes. The ten-year (1928-37) average was 53,785,000 boxes. The orange crop by States in 1939, in 1938 and for the ten-year (1928-37) average was as follows, in boxes:

	1939	1938	10-yr. average
California	30,080,000	41,152,000	34,715,000
Florida	35,000,000	33,000,000	17,842,000
Texas	2,732,000	2,815,000	677,000
Arizona	460,000	410,000	182,000
Louisiana	260,000	385,000	255,000
Alabama	75,000	96,000	78,000
Mississippi	59,000	85,000	39,000

For current data on the cost of marketing oranges see *Nation's Business* of July 1939, in which Robert W. Gordon quotes the California Fruit Growers Exchange average costs for marketing for five years, including five cents a box for advertising.

(S. O. R.)

Oregon. Area, 96,699 sq.mi.; population: April 1, 1930 (census), 953,786; 1938 (Oregon Chamber of Commerce

estimate), 1,053,000. Portland, 1939 (Polk's Directory estimate), 337,183. Salem, the capital, 1939 (estimate), 31,816.

History.—The year 1939 saw Oregon looking to the future and visioning great strides in its industrial path. Chiefly, this was due to the completion of the giant Bonneville dam. The first big industry to be attracted by the lure of cheap power was the Aluminum Corporation of America, which is located on the Washington side of the Columbia river with its \$3,000,000 plant.

But the State of Oregon took this as a healthy sign of the industry to come.

Meanwhile, Oregon was talking public utility districts. In every section to which transmission from the Government's big Bonneville project was feasible, groups of citizens talked of forming public utility districts. Private power companies at the same time faced sale to the districts. In its Holland-like Willamette valley, the beginning of the \$62,000,000 irrigation and flood control project was awaited. Embodying six dams, the project will be a giant "tap" on the flow of Willamette river water and will open thousands of acres to new farms.

The year 1939 saw labour peace in Oregon. The so-called anti-picketing law went into effect. This prevents picketing where more than 50% of the employees are not involved. As the year ended the A.F. of L. was trying out an experiment—using a large "unfair" headline on its own publication and having the paper offered for sale in front of any establishment where there was difficulty. This was held to be the sale of a newspaper rather than picketing, despite the obvious intent of the displayed headline.

The State dedicated its new \$1,000,000 library building, adjoining the new \$2,500,000 capitol. Looking to the future, Salem residences are making way on surrounding blocks for a capitol group.

The legislature moved into the capitol in Jan. 1939, after a regular and a special session in the Salem armory due to fire in 1935. The lawmakers did little, making minor changes in the income tax. Again they rejected all attempts at a sales tax, voted down repeatedly by the people of Oregon.

Education.—The census rolls show 270,396 children of school age (4 to 19), with 207,417 enrolled in public schools. Of these, 62,063 were in high schools. There were 7,887 teachers and administrators. There were 1,755 elementary schools, 264 standard high schools, 34 junior high schools, and the average teacher's salary was \$1,309.73, a gain of \$20.12 for 1938-39. The school debt stood at: bonds, \$14,627,954.83; warrants, \$1,258,957.79; other \$104,945.82; total, \$15,991,858.24.

Finances.—The condition of the State was increasingly favourable. The State bonded debt was reduced from \$50,586,810 in 1936 to \$38,718,085 on Oct. 1, 1939.

Manufactures.—A census showed that there were 2,107 manufactures in the State, employing 117,396 persons, paying \$157,357,520 in wages, and producing products of a value of \$363,142,053. Of this total, lumber products accounted for \$127,760,857; canned and dried fruits and vegetables, \$24,212,542; flour and grain mill products, \$19,138,231; paper, \$16,643,999. (P. H. P.)

Osteopathy. Considerations of public health and welfare had a large place in osteopathic activities in 1939. It being a "legislative year," laws affecting the practice rights of osteopathic physicians, and their ability to serve their patients, were enacted or amended in Delaware, Florida, Maine, Montana, New York, Ohio, Oklahoma, South Dakota and Tennessee. California and Los Angeles were added to the list of important States and cities whose boards of health include osteopathic physicians. South Dakota and Tennessee forbade by law any infringement upon the rights of patients of osteopathic physicians in the admin-

Agriculture, Manufactures, Mineral Production.—Important crops, with provisional figures of production for 1939, are as follows: corn, 167,825,000bu.; soybeans, 7,854,000bu.; apples, 5,800,000bu.; tobacco, 28,160,000lb.; potatoes, 12,626,000bu.; wheat, 36,669,000bu.; oats, 35,490,000bu.; barley, 1,050,000bu.; tame hay, 3,487,000 tons. Corn in 1939 reached a record estimated yield of 49bu. per acre. Manufactures in 1937 were valued at \$5,099,816,893, with steel products, rubber tires, electrical machinery and motor vehicles leading. Total mineral output in 1937 was valued at \$131,025,104. Principal minerals were coal (\$44,313,000), clay products (\$24,329,083), natural gas (\$19,967,000), stone (\$9,426,808), coke (\$32,185,945), lime (\$8,653,571) and pig iron.

Oklahoma, the forty-sixth State of the United States, and popularly known as the "Sooner State," has a total area of 70,057 square miles. The population in 1930 was 2,396,040 (estimated July 1, 1937, as 2,548,000). The capital and largest city is Oklahoma City, population 185,389 (estimated, 1939, 225,000); the second largest city is Tulsa, 141,258 (estimated 160,000). Of the State's population, 821,681 were urban, or 31%; 2,095,671 were native white; 26,753, foreign-born white; 172,198, coloured; and 92,725, Indian.

History.—The year 1939 opened with the inauguration on January 9 of Leon C. Phillips as 11th governor. The 17th legislature remained loyal to the new governor and the session ended with little change in the way of taxation or increased appropriations. The heavy debt of the State has been constantly criticized by the governor and steps have been taken in an attempt to bring about a more economical State Government. In August the State forced all oil production to cease and for two weeks all State wells were shut down. The situation came as a result of similar action taken in Texas and was widely heralded as a price-fixing scheme. However, State officials stoutly maintain that production exceeded the market demand and that the purpose was conservation as State statutes define any production of oil over market demand as waste.

On the educational scene, strife appeared between the governor and the State department of education over issuance of the \$11,000,000 common school fund. In addition, control of the State teachers colleges was wrested from the State board of education and placed in the hands of a college board of regents. As a result of laws passed by the 17th legislature the so-called teachers colleges were changed to State colleges and in many instances changes were made in the administration of the schools. At present, the governor has the power to approve all institutional budgets by the quarter and to make any recommendations he feels are necessary for the economic stability of the State.

Education.—The educational institutions include the University of Oklahoma, Norman; Oklahoma Agricultural and Mechanical college, Stillwater; Panhandle Agricultural and Mechanical college, Goodwell; Oklahoma College for Women, Chickasha; Colored Agricultural and Normal university, Langston; six State colleges, formerly teachers colleges; four secondary agricultural schools; three junior colleges; with six independent senior colleges, and three independent junior colleges. There are 19 municipal junior colleges and 868 approved high schools. Elementary and high school district average daily attendance, 1939, was 497,120.

Charities and Corrections.—The hospital and eleemosynary institutions include three white mental hospitals located at Norman, Vinita and Supply; two tubercular hospitals at Clinton and

Talihina; two orphan homes at Helena and Whitaker; school for the deaf, Sulphur; school for the blind, Muskogee; Deaf, Blind, and Orphans' Home for Coloured Children, Taft; and the State Hospital for Negro Insane, Taft. The penal and corrective institutions include the State penitentiary at McAlester; Oklahoma State reformatory, Granite; Training School for White Boys, Pauls Valley; State Industrial School for White Girls, Tecumseh; and training schools for Negro boys at Boley and for Negro girls at Taft.

Banking and Finance.—Of the 77 counties, 69 are in the 10th (Kansas City) Federal Reserve District and eight in the 11th (Dallas) District. There are 182 banks under State supervision and 212 national banks. In 1939, 380 banks carried Federal Deposit Insurance and 14 did not. Bank deposits averaged \$445,396,000 during 1937. State expenditures for 1939-40 were estimated at \$100,000,000. There is (Jan. 1, 1940) no State ad valorem tax, the main source of revenue being a gasoline tax, a sales tax (2%), a production tax, and an income tax. The funded State debt stood at \$25,622,681 in July 1939. (Estimated debt, July, 1940, \$32,600,000.)

Agriculture, Manufactures, Mineral Production.—The chief agricultural commodities are wheat, cotton, corn, grain sorghums, and broom corn. The total value of agricultural products for 1939 was \$115,040,000 compared with \$110,312,000 in 1938 (a 4% increase). Wheat with a value of \$37,472,000 ranked first in 1939. The value of cotton and cotton seed was \$25,934,000. The 1939 season average prices of most crops was above that of 1938. The principal mineral products are petroleum, coal, lead and zinc, gypsum and asphalt. There is a known reserve of 3,500,000,000bbl. of petroleum and in 1939 there was a total production of 153,349,000bbl. of crude oil. In 1939, there were produced 1,062,212 tons of coal, 100,957 tons of lead and zinc, 98,264 tons of gypsum, and 51,254 tons of asphalt. The chief manufacturing interests are glass, cement, flour, brooms, bricks and all types of refinery products. The total value of manufactured products in 1935 was \$282,658,470. (R. Grr.)

Oliphant, Herman (1884-1939), U.S. fiscal expert, was born in Forest, Ind., on August 31. He took his bachelor's degree at Indiana university in 1909 and his doctorate of jurisprudence at the University of Chicago five years later. Meanwhile he was instructor of English at Marion college in Indiana. From 1914 to 1921 he taught law at the University of Chicago, and from 1921 to 1929 he was professor of law at Columbia university. In 1929 he helped organize the Institute of Law at Johns Hopkins university, where he assisted in the preparation of many notable surveys of judicial systems and litigation in the United States. Henry Morgenthau, Jr. invited him to Washington in 1933 to act as his legal counsel in the new Farm Credit Administration. After Morgenthau became Secretary of the Treasury on Jan. 1, 1934, he appointed Oliphant general counsel of the Department of the Treasury. This position he held until his death in Washington on January 11. Oliphant became widely known during Roosevelt's second administration as author of the ill-fated undistributed profits tax.

Ontario, one of the original provinces of the Dominion of Canada; area, 412,582 sq.mi.; population according to the Dominion census of 1931, 3,431,683, estimated Jan. 1,

1940, 3,731,000. Capital, Toronto, 631,207. Of the Province's population 2,095,992 are urban, or 61%; 2,794,631 native born or 81%.

Much attention has been directed to the policy of the Government of Ontario in supplying cheap light and power to the people of the Province through the publicly owned and controlled Hydro-Electric Power Commission. The Commission provides electric services to 782 municipalities, comprising nearly all of the cities and towns in the Province as well as many small communities and local areas. The actual distribution within a municipality is performed by the municipality itself, under the supervision of the Commission. The capital of the Commission and Municipal Utilities amounts to \$424,422,000. reserves \$184,016,209. Rates are low and the service is excellent. The net value of the total production of the Province in 1936 was \$1,183,844,782. an increase of 10% over the preceding year. The net annual agricultural revenue in 1936 was \$234,619,984; of mineral products for 1936, \$151,874,462. The net value of forest products was \$58,390,676; of manufactured products \$686,470,917.

The provincial election of 1937 resulted in the return to power of the Liberal Party under the leadership of the Hon. Mitchell Hepburn. The party standing of the Provincial Legislature comprises 63 Liberals, 23 Conservatives and 4 Independents. The lieutenant-governor is the Hon. Albert Matthews. Ontario is represented in the Dominion Parliament by 24 senators, appointed for life and 82 members of the House of Commons elected for a term of five years or less.

Oranges. Bumper crops and a market disrupted by war were the lot in 1939 of the orange section of the citrus fruit industry, which, as a whole, has had the largest expansion of any branch of agriculture in the last 20 years. Exports of oranges from Spain for the season ending Oct. 31, 1939, were 2,572,000 half cases, compared to 3,243,000 half cases for the 1938 season. The five-year average (1933-37) was 10,479,000 half cases. Orange groves of Spain were less damaged "than would be supposed," official advices report. Orange exports from Egypt for the season ending March 31, 1939, were 729,000 boxes, compared to 341,000 boxes in the preceding season. The United States orange crop in 1939 was estimated by the Department of Agriculture as 78,564,000 boxes. In 1938, the record high, it was 78,863,000 boxes. The ten-year (1928-37) average was 53,785,000 boxes. The orange crop by States in 1939, in 1938 and for the ten-year (1928-37) average was as follows, in boxes:

	1939	1938	10-yr. average
California	30,050,000	41,152,000	34,715,000
Florida	35,920,000	33,020,000	17,842,000
Texas	2,730,000	2,815,000	677,000
Arizona	400,000	430,000	180,000
Louisiana	200,000	385,000	255,000
Alabama	75,000	90,000	78,000
Mississippi	59,000	85,000	39,000

For current data on the cost of marketing oranges see *Nation's Business* of July 1939, in which Robert W. Gordon quotes the California Fruit Growers Exchange average costs for marketing for five years, including five cents a box for advertising.

(S. O. R.)

Oregon. Area, 96,699 sq.mi.; population: April 1, 1930 (census), 953,786; 1938 (Oregon Chamber of Commerce

estimate), 1,053,000. Portland, 1939 (Polk's Directory estimate), 337,183. Salem, the capital, 1939 (estimate), 31,816.

History.—The year 1939 saw Oregon looking to the future and visioning great strides in its industrial path. Chiefly, this was due to the completion of the giant Bonneville dam. The first big industry to be attracted by the lure of cheap power was the Aluminum Corporation of America, which is located on the Washington side of the Columbia river with its \$3,000,000 plant.

But the State of Oregon took this as a healthy sign of the industry to come.

Meanwhile, Oregon was talking public utility districts. In every section to which transmission from the Government's big Bonneville project was feasible, groups of citizens talked of forming public utility districts. Private power companies at the same time faced sale to the districts. In its Holland-like Willamette valley, the beginning of the \$62,000,000 irrigation and flood control project was awaited. Embodying six dams, the project will be a giant "tap" on the flow of Willamette river water and will open thousands of acres to new farms.

The year 1939 saw labour peace in Oregon. The so-called anti-picketing law went into effect. This prevents picketing where more than 50% of the employees are not involved. As the year ended the A.F. of L. was trying out an experiment—using a large "unfair" headline on its own publication and having the paper offered for sale in front of any establishment where there was difficulty. This was held to be the sale of a newspaper rather than picketing, despite the obvious intent of the displayed headline.

The State dedicated its new \$1,000,000 library building, adjoining the new \$2,500,000 capitol. Looking to the future, Salem residences are making way on surrounding blocks for a capitol group.

The legislature moved into the capitol in Jan. 1939, after a regular and a special session in the Salem armoury due to fire in 1935. The lawmakers did little, making minor changes in the income tax. Again they rejected all attempts at a sales tax, voted down repeatedly by the people of Oregon.

Education.—The census rolls show 270,396 children of school age (4 to 19), with 207,417 enrolled in public schools. Of these, 62,063 were in high schools. There were 7,887 teachers and administrators. There were 1,755 elementary schools, 264 standard high schools, 34 junior high schools, and the average teacher's salary was \$1,309.73, a gain of \$20.12 for 1938-39. The school debt stood at: bonds, \$14,627,954.83; warrants, \$1,258,957.79; other \$104,945.82; total, \$15,991,858.24.

Finances.—The condition of the State was increasingly favourable. The State bonded debt was reduced from \$50,586,810 in 1936 to \$38,718,085 on Oct. 1, 1939.

Manufactures.—A census showed that there were 2,107 manufactures in the State, employing 117,396 persons, paying \$157,357,520 in wages, and producing products of a value of \$363,142,053. Of this total, lumber products accounted for \$127,760,857; canned and dried fruits and vegetables, \$24,212,542; flour and grain mill products, \$19,138,231; paper, \$16,643,999. (P. H. P.)

Osteopathy. Considerations of public health and welfare had a large place in osteopathic activities in 1939. It being a "legislative year," laws affecting the practice rights of osteopathic physicians, and their ability to serve their patients, were enacted or amended in Delaware, Florida, Maine, Montana, New York, Ohio, Oklahoma, South Dakota and Tennessee. California and Los Angeles were added to the list of important States and cities whose boards of health include osteopathic physicians. South Dakota and Tennessee forbade by law any infringement upon the rights of patients of osteopathic physicians in the admin-

istration of public health programs, and Ohio made it unlawful for non-profit hospital service plans to discriminate against them. Rights of the people to select physicians properly accredited and licensed by the States, without regard to their school of practice, were protected also in numerous laws and regulations having to do with such public health problems as pre-marital examinations, examinations of expectant mothers, etc.

In preparing better to serve the public the American Osteopathic Association completed the organization of an advisory board for the certification of specialists, and advance steps were taken by the Associated Colleges of Osteopathy, the American Osteopathic Hospital Association and the National Board of Examiners for Osteopathic Physicians and Surgeons. Osteopathic colleges improved their facilities for giving postgraduate work, and the number of osteopathic hospitals training interns was increased.

In its public health educational efforts, osteopathy extended greatly its radio and other informational enterprises. The American Osteopathic Association was officially represented before the U.S. Senate committee studying the bill to set up a national health program (the so-called Wagner Health bill), continued its participation in the National Council for Mothers and Babies and was represented in the White House Conference on Children in a Democracy. The 1939 convention of the American Osteopathic Association was held in Dallas, Texas. (R. G. HU.)

Ottawa, the capital of the Dominion of Canada and the seat of the Supreme Court, is situated on the right bank of the Ottawa river near the mouth of the Rideau, both rivers having very beautiful falls. The city itself is divided into an upper and a lower town by the Rideau canal. The Parliament buildings are situated on a series of high bluffs which overlook the river, in one direction toward the Chaudière falls and in the opposite direction toward the Rideau falls. The population of the city is 126,872; of the metropolitan district (including Hull) 175,988. The gross value of manufactured products in 1939 was \$25,043,818. Its most important educational institution is the Université d'Ottawa.

Oxford University. Gifts of £23,000 and £6,000 from the Rockefeller Foundation and Imperial

Chemical Industries respectively were made for the erection of a new wing to the organic chemistry laboratory and for the purchase of special apparatus and equipment for it. Gifts of £550 a year for seven years from Harry Sacher and of £500 a year for five years from Manchester college have made it possible to establish readerships in post-Biblical Jewish studies and in religious education.

The number of matriculations in the academic year 1938-39 was 1,717, which is 101 more than in the previous year. The number of research students increased by 12 to 459; 1,135 persons took the

B.A. degree; 552 the M.A., and the total number of persons taking all other degrees was 243.

The total expenditure of the university (exclusive of the colleges) in 1937-38 was £527,548.

T. F. Higham succeeded Dr. Cyril Bailey as Public Orator.

In accordance with arrangements settled between the university, H.M. Government and other bodies in the course of the year, many university and college buildings were made available for public purposes on the outbreak of the European war. The university also, by arrangement with the military authorities and the Ministry of Labour, provided accommodation and staff for the board which selected volunteers from among the younger members of the university for certain branches of national service. The board dealt with 2,362 offers of service.

Pacific Islands, British. Territories of the British Empire in the Pacific ocean, of which certain essential statistics are given in the table below. See **BRITISH EMPIRE** for population, capital towns, status, and governments.

History.—The most important of these are the Fiji islands; the British Western Pacific islands, comprising the colony of the Gilbert and Ellice islands and the Solomon islands and Tongan islands protectorates; the New Hebrides, under joint British and French administration; and the Australian territory of Papua.

Fiji suffered severe floods in January. The new Government buildings were opened on May 12. A significant step, for good or ill, was the transference to the Government of the Suva Municipal Council.

A severe earthquake on April 30, followed by a tidal wave, caused considerable damage and some deaths in the Solomon islands. A 50-year agreement was signed with the U.S.A. for joint occupation of Canton and Enderbury, islands in the Phoenix group of the Gilbert and Ellice islands colony.

In Papua, a territory in the north, explored in 1935 but hitherto a prohibited area, was declared open. Disappointment was caused by the abandonment of operations by Papua Oil Development Limited.

The commission set up by the Australian Government reported against a proposal for uniting the mandated territory of New Guinea with Papua.

Territory and Area Square Miles	Principal Products exported 1938 (in tons)	Imports and Exports 1938 (in thousand £)	Revenue and Expenditure 1938 (in thousand £)	Education: Elementary and Secondary 1937
FIJI 7,055	sugar (total) 131,344 copra (total) 33,475	imp. £ Fiji 1,675 exp. £ Fiji 2,535	rev. £ Fiji 890 exp. £ Fiji 967	(1938) schls., 253; schlrs., 29,323 (1,622 Eurpn., 19,580 Fiji, 7,068 Ind., 153 Chinese)

*Canton and Enderbury islands, in the Phoenix group, are shared with the U.S.A. under the Anglo-American pact, Aug. 10, 1938.

Pacific Islands, French. The latest available statistics for this French colony are given herewith: area (Society, Tuamotu, Tubai and Marquesas Is.), 1,540 sq.mi.; pop. (est. Dec. 31, 1937) 45,000 (whites, c. 3,700). Chief town: Papeete (in Tahiti), cap., 8,460. Governor: M. Chastenet de Gurry.

Finance 1939: local budget (est.) 27,560,000 francs.

Overseas Trade 1938: imports 63,241,000 francs; exports 47,647,000 francs. Roads 1937: Tahiti 48mi.; Raiatea 19mi.; shipping (1938) cleared, 162,927 net tons.

Production 1938: copra 25,000 francs; vanilla 12,000 francs; natural phosphates (1937) 147,000 metric tons.

Pacific Islands, Mandated. The former German possessions in the Western Pacific comprise part of New Guinea with adjacent archipelagos, Western Samoa, the Marshall, Caroline, Palau and Ladrone or Marianne islands, and the islet of Nauru. Certain essential statistics of these territories are given in the following table. For capital towns and governors of New Guinea, Western Samoa and Nauru, see also BRITISH EMPIRE.

Territory and Area Square Miles	Population and Status	Principal Products	Imports and Exports (ooo's omitted)	Revenue and Expenditure (ooo's omitted)
NEW GUINEA, mandated territory (69,700) including Bismarck Archipelago (19,200) and Solomon Is. (4,100)	304,445 (white, 4,445) Under Mandate of the Common- wealth of Australia	(1937-38) gold £2,028,980; copra £847,734	(1937-38) imp. £1,011 exp. £2,980	(1937-38) rev. £A506 exp. £A509

Pacifism. Pacifism is a system of beliefs in the desirability and possibility of permanent peace. This belief may be based on liberal-humanitarian, rational-cosmopolitan or religious grounds. It always presupposes a belief in the essential unity of mankind and in the sanctity and dignity of individual existence. It is thus completely opposed to fascism which denies the oneness of mankind and the dignity of the individual and which believes that permanent peace is neither possible nor desirable because war alone awakens, according to fascism, the highest moral response in man. The communist attitude which rejects only certain wars which they label as "imperialist" or "capitalistic" wars, cannot be regarded as pacifist, even less the isolationist attitude which is based upon the sole consideration of national self-interest, and does not reject war in principle, but only if it does not involve their own nation's honour, security or wants.

A twofold attitude can be involved in pacifism. The one is the so-called "absolutist" pacifism as best represented by the conscientious objectors and by the War Resisters International which has its centre in England and branches in most democratic countries. They reject war under any circumstances and refuse to participate in it. With the outbreak of the European war in Sept. 1939 the British Government took this point of view into consideration and recognized it officially. Special tribunals were instituted before which conscientious objectors were to appear and to prove their sincerity which was generally presupposed in all men who had belonged to religious organizations taking the absolutist pacifist point of view like the Society of Friends. These tribunals either absolved the conscientious objectors from all military service or assigned them to non-combatant service.

Generally the European war of 1939 brought in Great Britain

and Canada no restriction upon any form of propaganda for absolutist pacifism.

Another pacifist attitude believes that the only promising approach towards the establishment of a secure international peace can be through establishing international law on a firm foundation so that disputes between nations be judged judicially as are disputes between other groups. This pacifism regards isolationism in the present war as one of the fundamental obstacles to the establishment of peace which can be reached only by concerted peace efforts of all peace-loving nations. It believes that no nation can live its own life in peace in a world of lawlessness and anarchy, and therefore it affirms the necessity for all nations to co-operate in finding ways and means to organize the international community for concerted action to oppose aggression. The ultimate aim of this pacifism is the establishment of a world organization which would not only secure peace, but also replace military rivalries by economic and cultural co-operation between the nations. The outbreak of the European war in 1939 resulted in the establishment of an International Peace Campaign with national committees in the United States, Great Britain, the British Dominions and France. This Campaign discussed the

foundations upon which the peace at the end of the European war should be based so as to achieve the aims of pacifism. This peace should establish a system of collective security which would make possible a settlement of international differences without resort to war, allow the immediate beginning of general disarmament and lay the foundations of justice and liberty for all peoples. There is no doubt that this war, with

its threat of spreading and drawing "neutral" nations into its maelstrom, has acted as a great stimulus to pacifism, as the only alternative to the establishment of a system of collective security seems to be the rapid increase in the burden of armaments and the growth of international chaos with its repercussions for all, even the most distant nations. A project much discussed during 1939 was the proposed federation of democracies, suggested by Clarence Streit, an American journalist, in his book *Union Now*. This proposal found wide response, especially in Great Britain. British and French statesmen have repeatedly declared that they envisaged as the outcome of the European war the creation of some form of federation or rejuvenated League of Nations to establish lasting peace. (See also INTERNATIONAL LAW; RELIGION.)

Packaged Fuel: see FUEL BRIQUETTES.

Painting. **United States.**—In American painting during the year 1939 two important turns of interest were evident. On one hand regionalist and "American Scene" emphases in subject matter notably diminished; and on the other, themes of social satire and political propaganda narrowed in popularity. Both these developments probably grew out of a fundamental dissatisfaction with the results that these approaches were producing. The Contemporary American Art Exhibition at the New York World's Fair, so carefully planned to bring to light anything of real interest in the way of regional expression, proved a distinct failure in this direction. Nothing with an unexpected tang was discovered.

"GEORGIA JUNGLE" by Alexander Brook of New York (1895-) won first prize at the 1939 Carnegie International exhibition in Pittsburgh

YASUO KUNIYOSHI (1893-), Japanese-born American artist, won second prize at the 1939 Carnegie International exhibition in Pittsburgh with his "Lay Figure—1938"

MURAL for the Department of Interior building, Washington, D.C., by William Gropper, entitled "Construction of the Dam," Installed May 7, 1939

ONE OF EDGAR BRITTON'S two murals, "The Story of Petroleum," completed in Aug. 1939, for the Department of Interior building, Washington, D.C.

And once the novelty of political and class-conscious expressions had worn thin, the narrow and shoddy repertory of pictorial conventions upon which they were hung began to show through. It was clear that the essentials of pictorial expression had been neglected in these emphases on the associational interests in subject matter. Finally, the signing of the pact between Berlin and Moscow left political propagandists in an embarrassing quandary; while the major scale of the threatened tragedy abroad made such daintily patriotic whimsies as the Iowan Grant Wood's 1939 version of George Washington and the cherry tree legend, "Parson Weem's Fable," seem pathetically jejune.

During 1939 the serious curtailment of the WPA Arts Project patronage was in part offset by commissions to mural painters and sculptors by the New York World's Fair and the Golden Gate Exposition; while in Washington the section of fine arts of the Public Buildings Administration, under the directorship of Edward Bruce, held the largest competition since the inauguration of this system in 1934. One thousand four hundred and seventy designs were submitted anonymously; out of these 48 were chosen for execution. Yet neither this competition nor the opportunities provided by the extensive Fair commissions brought to light any striking new direction or talent. Even at the New York Fair the most satisfactory mural was the decoration of the inner court of the Old Masters Building by the repatriated, experienced Lyonel Feininger.

Of the older generation, however, it was John Marin who primarily distinguished himself during the year for his bold and imaginative exploration of the medium of oil-paint which he had taken up only in the last few years. On the other hand, his water-colour expressions suffered no neglect and preserved all their personalized spontaneity and freshness. At the same time, the younger water-colourist, Charles Burchfield, who had been painting relatively sombre oils during the last few years, seemed to throw a backward glance to his fanciful water-colours of 1917 and 1918 and from them recover a new lyricism for his 1939 work; while George Grosz, also well known for his work in the water-colour medium and in biting social caricature, turned with a quiet but intense enthusiasm toward still-life and the depiction of texture contrasts in oils. Yasuo Kuniyoshi's first exhibition in three years showed him likewise placing an emphasis on textural effects. While his work was primarily a display of technical virtuosity it took rather the character of a distillation of effects than a development or change of direction. Like Kuniyoshi, Franklin Watkins in his 1939 work also leaned toward a primary interest in technical refinements. But in contrast to both these painters, Arthur Dove in his exhibition at "An American Place" returned to his early college interests with a fresh lyric note, while Marsden Hartley turned from his usual landscapes to a rough, burly figure-depiction; and William Gropper, in his Paul Bunyan series, laid primary stress on the energy of his brushwork. a richness of colour and deepening of plastic effects.

Europe.—The year 1939 will stand as a vital date in the history of European art. Not so much for what was produced in that year, but because it marked the close of a period. How long the present hostilities may last will not change the situation. The aesthetic outlook of Europe between the years 1919 and 1939 is permanently consigned to history. Should even the first months of 1940 see a withdrawal of troops from the field and a new economic peace there could be no return to the *status quo*; so many artists, philosophers, historians and teachers have been transplanted from Europe that a new peace-time must belong to a new generation. Already in 1939 the United States had begun to show the effects of these wholesale exportations of trained minds in a relaxation of regionalist prejudices against foreign influences; while Europe's discouragement and uncertainty of the future were evident in its relative unproductiveness in the fields of painting and sculpture.

Germany. controlling (Jan. 1, 1940) the greater part of middle Europe, dictated the art attitudes of that region as well as its political allegiance. The hostility of the Reich persevered toward all forms of the unconventional or even the unfamiliar in painting and sculpture which it had condemned publicly as "degenerate art." In fact the Government took an even bolder stand in the spring and summer of 1939 and offered many of the more valuable examples of late 19th and early 20th century foreign painting from

its museums for sale, both privately and at a public auction held in Switzerland. At the same time the officially approved art continued along the line of banal academicism.

Czechoslovakia. like Austria, after its absorption into the Reich gave over completely its earlier artistic individuality. Prague, previous to the Munich agreement had been one of the leading centres of modern art in Europe. But immediately following the Munich concordat all non-national tendencies in art were officially discouraged—particularly those that had been influenced by German expressionism or any of the various movements of Paris during the last half-century. The new prime minister, Beran, declared: "We must put an end to the modern scribble and smear artists and the jazz cries of modern art. We must return to our own Czech art and keep away from non-national tendencies." Many of the most prominent state art and museum officials were relieved of their positions primarily because of liberal sympathies. Notable among them was Vincenc Kramar, the director of the State Gallery of Old Art in Prague, a man of wide culture and scholarship who owned one of the richest collections of Cubist paintings in Europe, and whose book *Kubismus* (1921) was one of the earliest to be devoted entirely to Picasso in any language. Czech caricature, which boasted some of the most brilliant satirical draughtsmen in Europe was completely crippled. Thanks to the new censorship the drawings and montages of such men as Pelc and Hofmeister could no longer be published. While the painters Hartfield and Kokoschka, both closely identified with Prague during the last few years, left the country shortly after its assimilation by the Reich.

Italy. for all her totalitarian colour, had never taken the attitude to the arts that Germany and Russia had. Undoubtedly the senatorial rank of Marinetti, the founder of Italian Futurism in 1909, and Mussolini's early link with the literary members of that movement have played their part in the liberal official attitude of Fascist Italy. It is true that the recent work of Giorgio di Chirico, Fontana, Funi and others of their immediate group can scarcely be regarded as strikingly venturesome, leaning, as it does, toward a broad humanism. Nevertheless, the painting of such abstract artists as Alberto Magnelli, Pompeo Bona and Mauro Reggiani is also exhibited and encouraged. And in 1939 Magnelli clearly showed himself competent to stand up with the leaders of extreme abstract expression in their exhibitions in Paris. Furthermore, there has been no prejudice against displaying work of foreign surrealists in Italy nor against the acceptance of their influence by such young surrealist-abstractists as Adone Asinari, Corrado Forlin and Gelindo Furlan.

Spain. in spite of the cessation of civil strife, was still, in 1939, most effectively represented in painting and sculpture by artists working outside its frontiers. Pablo Picasso in Paris had turned to large colourful portraits based on a pictorial symbolization of muscular and psychological responses to the subjects rather than the conventional visual approach. The result, in his most successful essays, was a new vitality of rhythmic organization well in accord with his natural linear predilections and a powerful gamut of non-naturalistic colour-contrasts. Joan Miró, in Paris also, found a new freshness in his 1939 work after his larger, more restrained compositions of 1937 and 1938. But while Picasso's new strength came from an increased tempo of development along lines which he had been following for some time, Miró's freshened note was struck by a return to earlier whimsical fantasies. For in his recent work Miró has completely abandoned the trend toward expressionistic realism which his large 1937 still-life "A Pair of Shoes" had seemed to inaugurate, for a lighter and gayer lyricism closer in spirit to his work of the pre-revolution period. At the same time the arch-surrealist, Salvador Dalí, continued to flout the conventions of the conservative art public, both in Paris and New York with consummate success. Still, in his large exhibition held in New York in the spring of 1939 there was a notable relaxation of the technical finesse which had so consistently characterized Dalí's earlier work. And here, for the first time, certain political references were allowed to creep in with the obvious purpose of bribing popular sympathy.

France. although relatively removed from the actual centres of trouble during the first six months of the year, seemed also to feel the threatening shadow. Shortly after the September crisis of 1938 Piet Mondrian, the Dutch neo-plastician, joined the constructivist sculptor Nahum Gaho in London. Antoine Pevsner, the brother of Gaho, continued his work with Domela in Paris; and all four collaborated in the comprehensive international exhibition of abstract art organized in the early summer by Péro Van Doesberg, the widow of the founder of the Dutch Die Stijl movement. Henri Matisse, after finishing an important mural decoration for the apartment of Nelson Rockefeller in New York continued to work out extremely fresh decorative compositions with a new two-dimensional emphasis and a spontaneity of draughtsmanship that recalled his style previous to 1919 and particularly his early graphic work. The first two months of the year saw Fernand Léger in New York where he painted several decorations for the Rockefeller apartment and a sketch for a mural at the World's Fair. After his return to France and the outbreak of the war he withdrew to his native Normandy and set about a series of figure compositions, twice life size. Braque and Derain continued to work on large canvases more or less along the lines of their recent work; while the autumn months saw many of the younger men mobilized—the painter Jean Hélion even coming back from an extended sojourn in the United States to join the ranks. Early in 1939 the 77-year-old sculptor Aristide Maillol completed his monument "L'Air" for the city of Toulouse. And in the spring the former Cubist, Henri Laurens, held a notable one-man exhibition of sculpture in Paris in which works such as his "Amphion" showed a profound revitalization of expression.

Belgium. in June saw James Ensor, the dean of its impressionists, paid the honour of a large one-man exhibit in Paris. Earlier in the year the younger expressionist painter, Constant Permeke opened an exhibition of sculpture at the Palais des Beaux Arts in Brussels which placed him, in the opinion of the leading critics, with Constantin Meunier and Rik Wouters as one of the three greatest sculptors of Flanders in modern times. All three had been painter-sculptors, or perhaps better, sculptor-painters—each representative of a particular idiom; naturalism, impressionism, and expressionism. Permeke only took up sculpture at the age of 52.

Still it is not quite exact to state that this is an entirely new vein of expression for him. In reality in his sculpture he pursues the basic idiom of Permeke the painter—gigantic elementary nudes. Constant Permeke's expressionism is profoundly Flemish—a colossal and imperious monumentality. So in spite of his brusque change of metier, he kept integrally in his sculpture all the qualities, as well as the weaknesses and faults, of his painting. Among the young Belgians, Paul Delvaux and René Magritte, both surrealists, continued to do the most interesting easel paintings during 1939; while Auguste Mambour's large fresco in the Lycée Léonie de Waha in Liège in its originality and architectural suitability is easily the finest mural decoration produced in Belgium for many years.

England has never been a notable contributor to the plastic experimentation which has marked European painting in the 20th century. Still, in the last few years, there has been a growing audacity and receptivity to extra-territorial influences on the part of young English artists. And, in 1939, while well known names such as Walter Sickert, Duncan Grant, Matthew Smith, Vanessa Bell, Mark Gertler and Stanley Spencer are still widely represented by work and exhibitions, new names begin to take a front rank of interest if not of achievement. Among the younger men John Piper probably made the most notable advance in 1939. His landscapes show at once the benefits of his research in collage and in compositions of abstract forms. They offer an extremely personalized idiom and a free lyric sensibility to nature that gives his work a genuine distinction. Allied to Piper in his predominantly plastic interests are the two older men, Paul Nash the painter and the sculptor Henry Moore. Nash's response to the fantastic in nature brings him close to the surrealist fold, yet never tempts him to lose his English eye for the objective world about him; on the other hand Moore keeps one foot in the field of surrealism and the other in the camp of the abstract artists with such success that his latest productions make him probably the most interesting plastic artist in England today. During 1939 Ben Nicholson, the leader of extreme abstractionists, gave his earlier white geometrical reliefs a wide range of contrasting flat colours, but made no concessions to naturalistic representation. And sympathy with the abstract approach continued to show itself in the work of such men as Jackson, Stephenson and Hayter, even penetrating the London group in the work of John Tunnard, Roy de Maistre, Ceri Richards and others, in a less absolute form leaning rather toward surrealism. Among the avowed English surrealists the most striking newcomer of 1939 was the sculptor F. E. McWilliams; while the painter, John Armstrong in "his practical exploitation of ruins" or in a canvas such as his "River of the Dead" frankly ties a thread of the English romantic tradition into the warp of surrealist approach. (J. J. Sw.)

Paints and Varnishes. United States production figures for the early months of 1939 showed a recovery from the slump of 1938, and a generally improved condition which promised well for the later months and for 1940. There has been a substantial change in paints and enamels toward balanced formulation, resulting in easier application, improved coverage, gloss and colour retention and increased life.

The developments in white pigments mentioned more particularly in connection with titanium oxide and zinc sulphide have resulted from study of the physical as well as the chemical characteristics. The literature carries numerous articles on X-ray studies of the crystal structure and infra-red studies of the particle size and distribution of pigments which point definitely to an even more nearly complete technical control of the protective coating industry.

The work of Dr. Kathryn Blodgett in the elimination of reflection from glass surfaces by the use of thin films of organic coating material may lead to interesting developments in the paint field. Illuminating engineers are awaiting with decided interest the commercial exploitation of recent developments in wall coating which absorb radiant infra-red rays and, consequently, give promise of enabling the illuminating engineers to increase the intensity of office, shop and home lighting to higher levels without, at the same time, raising the temperature unduly. Developments in pigment types and in paint formulation give indications of reflection in the ultra-violet of the same order of magnitude as in the visible spectrum, which may lead to dual purpose lighting. The so-called pearlescent or opalescent finishes, so popular in pyroxylin lacquer coatings, have, during the year 1939, been produced in synthetics with a consequent improvement in the appearance of industrial synthetic enamels.

Coloured pigments in general have shown an improvement in quality, light stability and chemical resistance; and some new pigments, such as the phthalocyanine green, have been offered on the market.

The shortage of raw materials, more especially oils, has inspired more intensive research, with the result that substitutes for tung oil, both compounded and chemically manipulated (dehydrated castor), have appeared and have considerably relieved the shortage. Soybean oil has received its share of attention from the new U.S. Department of Agriculture Regional Laboratories, and from private investigators, resulting in a rather pronounced increase in consumption. Still further work along agromineral and chemical lines and in processing technique will quite certainly broaden the scope of this interesting oil.

On the whole, the situation might be summarized as a general improvement in paint, varnish and lacquer formulations, supplemented by developments in raw materials, and a more thorough technical understanding of protective coating performances. (See also ELECTRIC LIGHTING.)

Palaeontology. In Russia, A. N. Riabinin published an account of the discovery of dinosaurs, turtles and fishes in the Tashkent-Chimkent district of South Kazakhstan. Several new forms of each of these groups are named. The beds in which these fossils occur are regarded as Upper Cenomanian and Turonian in age. The presence of the remains of sauropodous Dinosauria (Titanosauridae) has been established; a discovery of much interest as indicating a further extension of this already widely dispersed family.

In the United States, several important advances have been made in vertebrate palaeontology, C. Lewis Gazin described new genera and species of Palaeocene mammals from a new locality in central Utah. This assemblage displays a stage of development indicating them to be intermediate in age between the well established faunas of the Puerco and Torrejon of the New Mexico region. Messrs. E. H. Barbour and C. B. Shultz described a new genus of camel from the Pleistocene deposits of south-western Nebraska. This gigantic new animal (*Gigantocamelus*) is said to have attained a height of 12 feet. A fossil egg from the Permian of Texas described by A. S. Romer and L. L. Price is unique in being the most ancient egg of a vertebrate animal ever found. It is thought to have been laid by one of the early reptiles.

A skull of the curious horned mammal *Braurotherium* from the Tertiary of India and a new rodent (*Mastomys*) were described by Dr. G. Edward Lewis. For the first time the complete osteological structure of the Stegocephalian, Seymouria, from the Permian was made known by the published studies of T. E. White.

The republishing of a revised edition of William D. Matthew's important work *Climate and Evolution* by the New York Academy of Science is an event of much importance to all palaeontologists.

In invertebrate palaeontology, one of the important papers of 1939 is by Kenneth E. Caster, describing a hitherto unknown Middle Devonian fauna from Colombia, South America. In this article the stropheonid Brachiopoda are revised. Another important advance is a monographic study of the foraminiferal family Nonionidae by Joseph A. Cushman. It is world wide in the scope of materials treated and includes all of the known forms of this family from the Jurassic up through the Tertiary, including the living members. A paper by Charles E. Resser describes the first complete Middle Cambrian fauna from the Wasatch mountains of Utah and Idaho. A great number of new forms are described.

During 1939, A. Okladnikov published an account of the discovery of the skeleton of a Neanderthal child associated with characteristic Mousterian implements and an old fauna in a cave near Baisun, Uzbekistan, Central Asia. This find greatly extends to the eastward the known occurrences of Neanderthals and for the first time establishes the existence of this rare skeleton in Central Asia. This discovery will exert a profound impression on the concepts of human prehistory in the Old World, and will necessitate

a material revision of ideas relating to the Neanderthal phase of human antiquity. (See also GEOLOGY; ZOOLOGY.)

Palestine. Area 10,429 sq.mi. (water 272 sq.mi.); pop. (est. Dec. 31, 1938) 1,435,285; immigration (1938): Jews 12,868; Arabs 473; others 1,922. Chief towns (pop. est. 1938): Jerusalem (cap. 139,000); Haifa (104,000); Jaffa (77,000); Tel-Aviv (130,000). High Commissioner: Sir H. A. MacMichael; languages: English, Arabic, Hebrew; religions (1938): Mohammedan 900,250; Jewish 411,232; Christian 111,974.

History.—The year 1939 opened with the preliminaries for the conferences with representatives of the Jewish Agency, of the Palestinian Arabs and of the neighbouring Arab States, which the colonial secretary had announced the previous December were to be held in London.

These preliminaries took place first in Cairo, where, under the presidency of the Egyptian prime minister Mohamed Mahmud Pasba, representatives of Egypt, Saudi Arabia, the Yemen, Iraq and Trans-Jordan met to decide the composition of the Palestinian Arab delegation, and later in London where the colonial secretary sought to establish contact with each of the delegations in order to create a propitious atmosphere for the actual conference.

After protracted discussions and frequent communication with the Mufti at Beyrouth it was arranged that the Defence Party, the bitter opponent of the Mufti's Party, would join the official Palestinian Arab delegation. But when the conference assembled in London a hitch occurred and the London talks opened at St. James's Palace on February 7 without any Defence Party delegates.

Thanks, however, to the colonial secretary and the representatives of the Arab States a compromise was reached and two members of that party were included in the official Palestinian Arab delegation. The conference took place separately with the Arab and with the Jewish delegations, the discussions being conducted on parallel lines. To each the British prime minister delivered an inaugural speech.

Right at the outset the question of the correspondence between Sir Henry MacMahon and the Sherif Hussein was raised and the British Government, which had hitherto refused to do so, published the correspondence on March 3 as a *White Paper*. After lengthy discussion regarding the disputed passages, which the Palestinian Arabs considered confirmed their claim to Palestine, an Anglo-Arab committee of the conference was formed under the chairmanship of the lord chancellor to examine the questions raised.

In a *White Paper* published on March 21 the committee reported that both the Arab and the United Kingdom representatives had tried to understand each other's point of view but that they had been unable to reach agreement upon an interpretation of the correspondence. The United Kingdom representatives considered that the Arab contentions had greater force than had appeared hitherto. They maintained that on a proper construction of the correspondence Palestine was excluded from the area claimed by the Sherif of Mecca. But they agreed that the language in which its exclusion was expressed was not so specific

and unmistakable as it was thought to be at the time. The committee was further of opinion that His Majesty's Government were not free to dispose of Palestine without regard for the wishes and interests of its inhabitants. Meanwhile the conference itself had continued. The British proposals for an agreed settlement, finally submitted on March 15 to both the Arab and Jewish delegations, proved acceptable to neither and the conference ended on March 17 with the British Government considering the situation with a view to producing their own statement of policy.

The Arab delegates all returned to Cairo where further meetings were held to endeavour to find a formula acceptable to both the British Government and the Palestine Arabs. The Egyptian ambassador in London, Hassan Nasbat Pasha, flew out to Cairo with new British proposals and returned with the observations of the Arab and Egyptian delegates. No compromise could, however, be found and on May 17 the British Government issued in *White Paper* form its own statement of policy. In this *White Paper* His Majesty's Government declared unequivocally that it is not part of their policy that Palestine should become a Jewish State nor is there any justification for the Arab claim that it should become an Arab State. The objective of the policy was stated to be "the establishment within ten years of an Independent Palestine State in such treaty relations with the United Kingdom as will provide satisfactorily for the commercial and strategic requirements of both countries in the future."

This would be achieved by placing Palestinians in charge of Government departments with British advisers, subject to the High Commissioner's control, and by giving them seats on the Executive Council, which would ultimately be converted into a Council of Ministers. After five years a body representing the British Government and the people of Palestine would make recommendations for the constitution of an Independent Palestine State.

His Majesty's Government would require to be satisfied that in both the treaty and the constitution contemplated adequate provision had been made for the security of, and freedom of access to, the Holy Places, the protection of the various religious bodies, the special position of the Jewish National Home and the strategic requirements of the British Empire. If at the end of ten years His Majesty's Government considered that circumstances required the postponement of the establishment of the Independent State they would consult with representatives of the people of Palestine, the Council of the League of Nations and the neighbouring Arab States before deciding on such a postponement. Jewish immigration would be permitted for the next five years at the rate of ten thousand a year, and twenty-five thousand refugees would be admitted as soon as the High Commissioner was satisfied that provision could be made for them. After the period of five years no further Jewish immigration would be permitted unless the Arabs of Palestine acquiesced in it.

Finally the High Commissioner would have powers to prohibit and regulate transfers of land throughout the transitional period from the date of publication of the *White Paper*.

Immediately on the publication of the *White Paper*, Egypt and the Arab States declared through the Egyptian premier that their Governments felt unable to recommend the inhabitants of Palestine to collaborate with the British Government on the basis of the *White Paper* proposals.

These proposals were rejected by the Zionists and the Mufti's Party. The Defence Party, however, accepted them. On May 23 both Houses of Parliament approved the policy of H.M.'s Government relating to Palestine and on July 21 the colonial secretary gave the House of Commons an assurance that if the League Council reached a decision which in their view made it necessary to alter the mandate, H.M.G. would take no step without consult-

ing parliament.

During the first three months there had been an uninterrupted series of outrages in Palestine in which numerous Jews and Arabs were killed and the British forces and police suffered casualties. But, by the end of April, public security had sufficiently improved for the Government to consider that Sir Charles Teggart could safely relinquish his appointment as police adviser.

The publication of the *White Paper*, was, however, followed by a revival of unrest confined almost exclusively to the Jews which started with a 24-hour strike, mass demonstrations in Jerusalem and Tel-Aviv and a protest-procession by Jewish women.

Acts of violence, mainly Revisionist, continued for some time and the Palestine problem began to manifest a new feature in the form of a marked increase in illegal immigration.

So serious did this effort to get round the restriction imposed by the *White Paper* become that the colonial secretary announced on July 12 that he had authorized the High Commissioner to suspend the immigration quota for the next half-yearly period and that whether there would be a resumption of immigration quotas would depend on whether illegal immigration continued. This decision dissatisfied the Jews but gave great satisfaction to the Arabs.

The outbreak of war found the rebellion in full process of disintegration, various Arab leaders having either surrendered or been killed. All factional fighting ceased in response to an appeal for a truce from the High Commissioner, which was followed by offers from both the Arab and the Jewish communities of services to the mandatory power. The Jewish community within a month enrolled 90% of the Jews eligible between the ages of 18 and 50, and in many directions there were welcome instances of close Arab and Jewish co-operation in defence of their interests which the war had made mutual. (A. MN.)

Education.—1937-38: Arab public system maintained by Government, 402 schools (11 with secondary sections), 49,000 scholars; Moslem schools, private 184 (2 with secondary sections) with 14,052 scholars; Jewish schools 662 (including 6 training colleges and 27 secondary, 14 technical and 13 agricultural schools) with 71,376 scholars; Christian schools 193 with 24,046 scholars; Hebrew university, Jerusalem; 75 teachers, 733 students.

Banking and Finance.—Revenue (1938-39) £P.5,937,280; expenditure (1938-39) £P.5,692,671; public debt (March 31, 1939) £P.4,475,000; surplus balance (April 1, 1939) £P.2,533,265; notes in circulation (June 30, 1939) £P.5,931,967; exchange rate: £P.1=£1 sterling.

Trade and Communication.—Overseas trade 1938 (merchandise): imports (excluding military stores) £P.11,356,963; exports, domestic £P.5,020,368; re-exports £P.663,217. Communications and transport 1938: roads, all weather 1,783km.; seasonal 1,758km.; railways, standard gauge 280mi.; narrow 92mi.; airways: passengers 600, mail 88,213kg.; shipping, entered 1,971 vessels; 5,201,473 net tons. (Dec. 31, 1938) Motor vehicles licensed: 3,935 private cars, 1,031 public cars, 750 buses, 2,592 trucks and vans, 1,182 cycles; wireless receiving set licences 35,708; telephone subscribers, number 9,241.

Agriculture and Minerals.—Production 1938 (in metric tons): potash (exports) 50,288; oranges (exports 1938-39) 13,055,420 cases, (value) £P.3,865,292; barley 66,736; wheat (1938) 44,435; (1939) 136,100; olive oil (exports) 78,977; melons and water-melons 114,805; grapefruit (exports 1938-39) 2,066,833 cases, (value) £P.445,148; wine 31,000 hectolitres; maize 8,000; tobacco (1937) 2,500; potatoes (1937) 9,500; sesamum 4,000. (See also MINORITIES.) (W. H. WN.)

Panamá, a republic at the juncture of Central and South America; language, Spanish; capital, Panamá; president, Dr. Augusto Boyd; area, including the Canal Zone (under United

States jurisdiction): 34,169 sq.mi. The population was officially estimated at 547,536 in 1937 (1930 census: 467,459). The chief cities (with 1930 pop.) are: Panamá, 82,827; Colón, 33,460; Penonomé, 16,074; David, 16,004.

On July 25, 1939, after Panamá had suspended payments on her bonded indebtedness (held largely by United States citizens) in protest against the United States Senate's failure to ratify a treaty adjusting canal annuities, final ratification was obtained. Under the new treaty, Panamá receives \$430,000 annually instead of the former "\$250,000 gold." Upon outbreak of war in Europe, Panamá co-operated closely with the United States in measures for the protection of the Canal Zone, and was host to the Inter-American Congress at Panamá City (Sept. 1939). (See HISPANIC AMERICA AND THE EUROPEAN WAR.) Dr. Juan Demóstenes Arosemena, president since 1936, died on December 16 after a long illness. Dr. Augusto S. Boyd, eminent physician and Ambassador of Panamá at Washington, D.C., became acting president for the remainder of the presidential term (to Aug. 1940).

Panamá has 257mi. of railway and over 800km. of good highway, with more under construction. Her strategic position in relation to all parts of the Western Hemisphere makes her the hub of inter-American air and maritime transport. Imports, principally textiles and foodstuffs, aggregated \$17,651,454 in 1938, with 57% supplied by the United States; 9.3% by Japan. Exports, with bananas comprising 35%, were \$3,769,561 (88.6% to the United States). Re-exports were \$3,899,005. Tourist and Canal Zone purchases normally offset the "unfavourable trade balance." The Panamanian merchant marine, largest in Hispanic America (133 ships of 602,661 gross tons in 1938) was materially increased by transfers from United States registry in 1939. The monetary unit is the *balboa* (equal to the U.S. dollar). In the school year 1938-39 there were 629 primary schools (544 rural), with 61,706 pupils and seven secondary schools (3,830 enrolment). The National university (411 students in 1939) is at Panamá. Panamá has no army or navy, but maintains a national police force of 1,200. (L. W. BE.)

Panama Canal and Canal Zone, area, 553.8 sq.mi., of which 170.2 are water; population, June 1939, exclusive of Army and Navy personnel, 28,978, of whom 8,979 were United States citizens. The length of the canal from shore line to shore line is 40.27 miles. Both canal and zone are under the jurisdiction of the United States.

The Panama canal connects the Atlantic and Pacific oceans through the narrow isthmus of Panama, at approximately 9° N. lat. and 79° W. long. It was opened to traffic on August 15, 1914.

Revenues for the fiscal year 1939, principally from tolls, totalled \$24,487,616 and the net appropriation expenses were \$9,965,272, which left a net revenue of \$14,522,344, or a return of 2.86%, to the U.S. Government on its investment in the canal enterprises. The gross capital investment as of July 1, 1938, was \$540,694,148 and the net investment, after deducting reserves, was \$508,346,823. An interest return of 3% on this capital investment would have been \$15,250,405 from the year's operations, or \$728,061 more than was actually realized.

During the fiscal year ended June 30, 1939, there were 5,903 transits of ocean-going commercial vessels in comparison with 5,524 in the preceding year and 5,387 in the fiscal year 1937. Of the total number of commercial transits during the fiscal year ended June 30, 1939, 1,788 were of United States registry, 1,502 British, 704 Norwegian, 361 German, 261 Japanese, 312 Netherlands, 200 Danish, 193 Panamanian, 157 Swedish, 107 French and the remaining 318 of 11 other nationalities.

The origin and destination by principal trade areas of cargo in vessels passing through the Panama canal during the fiscal year

Traffic through the Canal for the Last Eleven Fiscal Years

Fiscal year ending June 30	Southbound (Atlantic to Pacific)		Northbound (Pacific to Atlantic)		Total		Tolls levied
	Vessels*	Cargo, tons	Vessels*	Cargo, tons	Vessels*	Cargo, tons	
1929	3,279	9,873,529	3,010	20,774,239	6,289	30,647,768	\$27,111,125

*Ocean-going commercial vessels, over 300 net tons Panama canal measurement, excluding canal vessels, Army and Navy, Panamanian Government, Colombian Army and Navy vessels.

ended June 30, 1939, is shown in the following table:

From Atlantic to Pacific

	Cargo, tons
United States intercoastal	2,391,523
United States and Far East (including Philippine Is.)	2,871,207
Europe and South America	415,697
Europe and Canada	78,789
Europe and United States	337,401
East coast United States and west coast South America	192,732
Europe and Australasia	542,770
United States and Australasia	374,544
All other trade routes	1,806,604
TOTAL	9,011,267

From Pacific to Atlantic

	Cargo, tons
United States intercoastal	4,493,203
Far East and United States (including Philippine Is.)	1,199,530
South America and Europe	2,481,541
Canada and Europe	2,539,436
United States and Europe	2,349,888
West coast South America and east coast United States	2,447,257
Australasia and Europe	759,794
Australasia and United States	86,999
All other trade routes	2,497,712
TOTAL	18,855,360

The principal commodities transported through the canal during the fiscal year ended June 30, 1939, segregated by direction of transit, were as follows:

From Atlantic to Pacific

	Long tons
Manufactures of iron and steel	1,495,497
Scrap metal	1,200,368
Mineral oils	1,032,671
Paper and products	402,264
Metals, various	400,285
Cotton, raw	250,752
Sulphur	234,879
Phosphates	202,981
Tinplate	194,186

From Pacific to Atlantic

	Long tons
Lumber	3,191,093
Mineral oils	2,777,201
Ores	1,991,690
Wheat	1,539,474
Nitrate	1,444,148
Sugar	1,329,276
Canned food products	1,232,636
Metals, various	674,314
Fruit, fresh	419,109
Fruit, dried	337,769
Cold storage (food products) (except fresh fruit)	335,874
Barley	259,612
Soybeans	236,099
Wood pulp	235,768

Tolls are levied on the net tonnages of ships. Prior to March 1, 1938, the rate for laden ships was \$1.20 per net ton, Panama

canal measurement, and for ballast ships \$0.72 per net ton, with the proviso that the amount collectible shall not exceed the equivalent of \$1.25 per net ton as determined under the rules for registry in the United States, or be less than \$0.75 per net ton on the same basis. However, during 1937, legislation was passed by the U.S. Congress, which made the Panama canal rules for measurement the sole basis for levying

tolls. Commencing March 1, 1938, tolls were assessed at \$0.90 per net ton for laden vessels and \$0.72 per net ton for ballast vessels based on new rules of measurement of the Panama canal. During the fiscal year ended June 30, 1939, tolls collections averaged \$4,008 per vessel of over 300 net tons, Panama canal measurement. (C. S. R.)

Panama Conference: see HISPANIC AMERICA AND THE EUROPEAN WAR; MEXICO.

Pan-American Union, an international body created by the 21 American republics for the fostering of mutual understanding and co-operation, with the essential duty of making effective the resolutions adopted by the successive Pan-American Conferences; headquarters, Washington; director general, Dr. Leo S. Rowe. A governing board plans inter-American gatherings for the purpose of conferring on problems of interest to all. A general conference of the member republics is held quinquennially. In 1939 the Union was active in making effective the resolutions adopted by the Eighth Pan-American Conference at Lima, aiding the special committees and conferences provided for by the Lima session. Most notable among its 1939 activities, however, were the Panamá congress of the ministers of foreign affairs of the American republics in September to determine joint action in the face of the European war (see HISPANIC AMERICA AND THE EUROPEAN WAR), and the resultant special conferences to provide the machinery for the declared neutrality. The Union is financed by contributions from its 21 members on the basis of population, and, because of its increased activities in 1939, membership assessments were increased. It has several important subdivisions, devoted to such specialized activities as foreign trade, intellectual co-operation, and agricultural co-operation.

BIBLIOGRAPHY.—Pan-American Union, *Bulletin* (monthly); *Pan-American Bookshelf* (monthly). (L. W. Be.)

Paper and Pulp Industry. The pulp and paper industry in the United States in 1939 was featured by the war conditions and increased business resulting therefrom. Paper production in Dec. 1938 was at about 74.4% of capacity and by Oct. 1939 had risen to 83%. Paper board during the same period rose from 61% to 83%. During the year two new mills were under construction, a newsprint mill at Lufkin, Texas and a cigarette paper mill at Brevard, N.C. There has been considerable expansion of existing mill properties.

In the paper board industry considerable progress is being made in the manufacture of containers of all kinds, largely at the expense of the lumber and cotton goods industries. In paper manufacture considerable advances are being made by the machine coating processes wherein a product is being made that is replacing paper coated by the slower coating methods. In pulping there is a continued trend toward the use of forced circulation and in the

kraft process vacuum washers have replaced diffusers in a number of mills. The production of tallol and fatty acids, as kraft mill by-products, has become an important factor.

World's Wood Pulp Balance Sheet
1938 Estimated—Short Tons

	Con- sumption	Imports	Pro- duction	Exports
United States	7,546	1,711	5,975	140
Canada	3,085	17	3,622	544
Germany	2,805	172	2,715	82

1938	12,860,000	16,000,000	5,934,000	7,546,000	8,194,000	1,030,000	9,224,000

Canada.—Business conditions in Canada reflected world conditions and in particular those of the United States, where so much newsprint is sold. Business started in 1937 under weak conditions and increased rapidly after mid-year. Although prices were increased these were offset considerably by the rising costs of raw materials, etc.

Board mills had an excellent year, particularly containers for the retail trade.

PRODUCTION OF NEWSPRINT in the United States and in Canada. Compiled by News-Print Service Bureau, New York city

There was no new mill construction during the year other than the rebuilding of the Gaspesia Paper Mill at Chandler, Quebec. There was, however, some expansion in existing mills.

An interesting technical development was the starting of a plant at Cornwall, Ont., mill of the Howard Smith Paper Company for the production of vanilla from sulphite waste liquor. At an earlier date the manufacture of yeast from this liquor was started at the Liverpool, N.S., mill of the Mersey Paper Company. These projects demonstrate the possibilities of producing chemical by-products from pulp mill wastes.

United Kingdom.—The paper business in the United Kingdom continued to be good in 1938 and in part of 1939. Although no official statistics have been issued since 1935, by the Board of Trade, the following for 1938 and probably for 1939 (in long tons) are approximately correct in so far as the use of raw materials is concerned.

Raw Materials in Paper Production, Great Britain

Material in Long Tons	Paper	Board
Bleached sulphite	117,000	18,000
Unbleached sulphite	555,000	25,000
Sulphate	212,000	38,000
Mechanical	703,000	47,000
Knotter	3,000	17,000
Esparto	130,000	..
Rags, etc.	50,000	..
Waste paper	10,000	290,000
Loading, etc.	220,000	15,000
	2,000,000	450,000

Price problems were the most important concern during 1939. The sale of newsprint was uneconomic since much of this material was bought for 1938 and 1939 on 1936 prices. In spite of price increases kraft mills ran to capacity. It is difficult to estimate (Jan. 1,

1940) the effect of European war conditions since some mills were turned over to munitions manufacture. There was probably a considerable increase in paper imports to offset this temporary decrease in production.

The total paper and board produced in 1939 was 2,306,452 long tons.

The total consumed was 3,200,000 tons. (R. G. M.)

Papua: see BRITISH EMPIRE; PACIFIC ISLANDS, BRITISH.

Paraguay, an inland republic in southern South America; language, Spanish; capital, Asunción; president, General José-Félix Estigarribia. The area is 154,165 square miles. The population (1936 census: 936,126) was officially estimated at 954,848 on Dec. 31, 1938. The chief cities are: Asunción, 104,819; Villarrica, 20,000 (est.); Concepción, 11,000 (est.); Encarnación, 10,000 (est.); Paraguari, 10,000.

History.—The dominant feature of Paraguayan development during 1939 was the economic and political rehabilitation begun under the leadership of General José Félix Estigarribia. Presidential elections called by Provisional President Félix Paiva were held on April 30, and General Estigarribia, hero of the Chaco War and the Chaco Peace, and, at the time, Paraguayan minister at Washington, D.C., was elected president without formal opposition. Before leaving Washington to be inaugurated on August 15, the president-elect and Pablo Insfran (later named as minister of Economics) carried on negotiations with the United States Gov-

ernment with the result that the United States Export-Import Bank granted credits to the extent of \$5,000,000. Technical advisers were obtained to assist in a program of renovation. Already, in Feb. 1939, United States Tariff Commissioner Harold D. Gresham had been loaned to the Paraguayan Government to act as an adviser in tariff and related matters.

Recognizing that one of the country's outstanding needs was the development of communications in order to break the monopoly of Argentina on Paraguayan external trade, with its accompanying high freight rates (Asunción-Buenos Aires freights exceed those from Buenos Aires to Europe), the Government began plans for a rail and highway connection to the Brazilian border, to link with a Brazilian railroad from the port of Santos. Construction was begun on the 220km. Asunción-Villarrica highway, while the new minister of economics gave particular attention to development of the country's latent resources. A "most-favoured-nation" treaty with Uruguay was concluded, along with commercial treaties with Argentina and Bolivia. Development of immigration (4,473 in 1938, of whom 3,604 were Poles) was accelerated, and Czech refugees were especially encouraged.

Education.—In 1937 Paraguay had 1,742 schools (enrolment: 139,466), including 129 private schools, with 6,179 pupils, 8 normal schools, and 12 secondary schools (2,500 enrolment). The National university at Asunción, had 847 students.

Finance.—The monetary units are the paper and gold peso, both based on Argentine currency (values: approximately $\frac{1}{3}$ and 68¢ U.S.).

Trade and Communication.—External communication is primarily by way of the Paraná river, with regular steamship service, and by railway and air service to Argentina. There are 1,147km. of railways. The highway system is in process of development.

Imports are chiefly foodstuffs, textiles, and machinery, and totalled 13,082,101 gold pesos in 1938. They were derived chiefly from Argentina (38.5%), Japan (15%), Germany (11.5%), Great Britain (9.7%), United States (9.6%). Exports totalled 12,017,228 gold pesos, and went chiefly to Argentina (47.1%, including 25.7% in transit), Germany (12.25%), Great Britain (13%), and the United States (12.3%). Exports are agricultural products, of which cotton comprises three-fourths; forest products, primarily quebracho logs and extract; and animal products, especially processed meats.

Resources.—Paraguay's resources are agricultural, pastoral and forestal. Cotton, mate (Paraguay tea), tobacco, sugar and citrus fruits are the leading agricultural commodities. Cattle are the principal livestock. Quebracho and its extract (tannin) are the most important forest products. Manufacturing is on a small scale and for domestic consumption, except for processed meats and some fine lace work for export.

Defence.—In 1939 Paraguay's defence forces included an army of some 10,000 men, and a navy of two gunboats. (L. W. BE.)

Parapsychology: see PSYCHICAL RESEARCH.

Parents and Teachers, National Congress of.

The National Congress of Parents and Teachers represented locally by parent-teacher associations was established in Washington, D.C., Feb. 17, 1897. On April 15, 1939, there were 2,291,420 active memberships enrolled in 27,111 parent-teacher associations in 49 State branches (including the District of Columbia) and in Hawaii and Puerto Rico. Approximately 63% of these associations are in elementary schools, 11% in junior and senior high schools, and 15% in 11- and 12-grade schools. Approximately 10% of the membership is composed of teachers.

Congress parent-teacher associations through their various ac-

tivities have for their purpose the education and welfare of youth. The activities of the parent-teacher associations vary with the type of school with which they are connected, the educational system under which the school operates, the customs and habits of the members of the group, and the social and economic life of the community. These activities relate to art, character education, child hygiene, exceptional child, home education, homemaking, humane education, international relations, juvenile protection, legislation, library service, mental hygiene, motion pictures and visual education, music, parent education, radio, recreation, safety, school education, social hygiene, student aid, and study of the use and effects of alcohol and narcotics.

The official parent-teacher magazine is the *National Parent-Teacher*, which is issued ten times a year. The *National Congress Bulletin* is sent monthly from September to June to every local president and to additional subscribers. The office of the National Congress is at 600 S. Michigan boulevard, Chicago, Ill. (J. K. P.)

Paris. From the beginning of 1939 preparations in case of war progressed steadily in Paris. A plan had been drawn up for closing half the "metro" stations and converting them into air raid shelters, the sections of line remaining open to be made impervious to gas and equipped with apparatus for filtering incoming air. The Prefect of the Seine received a credit of approximately £800,000 for the scheme, and work was started in January. The construction of underground roads to maintain communications in war and to relieve traffic congestion in peace-time continued. Some weeks before war broke out voluntary evacuation was urged upon all whose presence in the capital was not a necessity, and arrangements were made to allot each *arrondissement*, or district of the city, to a safe region in the surrounding country. By August 30, the compulsory evacuation of school children was well under way, and on that day nine hospital trains were drawn up at the Austerlitz station to remove the inmates from hospitals. The evacuation of certain Government departments, banks and other businesses (dressmakers removing to Biarritz) went on into September. Animals from the Vincennes zoo were distributed among collections throughout France. Trenches and shelters had long been made ready.

Steps were taken, as war approached, to safeguard the art treasures of Paris. The stained glass was taken from the Sainte Chapelle and from the cathedral of Chartres. The Louvre and other museums were stripped of their contents, which were taken to secret refuges among the former royal châteaux. The city's principal monuments and statues were sandbagged or boxed in.

Nearly 2,000,000 people were withdrawn from Paris and its suburbs in September. As the city remained unmolested, evacuated persons began to return in increasing numbers, against the advice of the authorities. Schools therefore re-opened on October 16 and the university faculties started work on November 6, public libraries also partly re-opening. Taxicabs and buses became more plentiful and shops re-opened, and cafés were keeping practically normal hours. The black-out, never as complete as in London, was relieved by increased street and shop-window lighting; on Jan. 4, 1940, it was made an offence for a pedestrian not to carry at night a torch, which must be flashed when crossing the road.

Apart from war preparations, there was some building activity during the year. Decrees were passed (February 28) remitting death duties on new properties within certain periods, which stimulated building, until it was checked by the war. Notable buildings completed in 1939 were: the new ministry of Posts, Telegraphs and Telephones, in the Avenue de Saxe et de Ségur, covering 10,000 sq.m.; the new theatre under the terrace on the site of the

old Trocadéro building on the right bank of the Seine, with seating for 2,800 people; and the museum of the ministry of Public Works designed by the Perret brothers on a neighbouring site. The renovation of the interior of the Opéra, delayed by the fire of September 26, was completed and a new lighting system installed. The city of Joan of Arc, a large slum in south-east Paris, was cleared to make room for new flats.

Park, William Hallock (1863–1939), U.S. immunologist and authority on public health, often called "the American Pasteur" because of his research in toxin anti-toxin, was born in New York city on December 30. He graduated from the College of the City of New York in 1883 and received his medical degree from Columbia three years later. In 1889 and 1890 he studied at the University of Vienna. From 1894 to 1937 he was director of the Bureau of Laboratories in the health department of New York city; he was also professor of bacteriology and hygiene at the medical college of New York university from 1897 to 1937. In 1908 two assistants, working under Dr. Park's direction, purified the anti-toxin for diphtheria. It was used with a great incidence of success in the public schools of New York city. Dr. Park was also inventor of a process for purifying milk and developed a new serum for infantile paralysis. He died in New York city on April 6.

Parks and Monuments: see NATIONAL PARKS AND MONUMENTS.

Parliament, Houses of. On August 2 the British Parliament was adjourned until October 3; but owing to the situation caused by the Danzig crisis an emergency session was held on August 24, when the prime minister and the foreign secretary made statements to the Commons and the Lords respectively and the Emergency Powers Act was passed. Parliament was prorogued on November 23, and the new session was opened by the King on November 28.

House of Commons.—Before the outbreak of war there were, during 1939, 19 by-elections to the British House of Commons, 17 of these being contested and 2 unopposed. A change of representation was brought about in two seats, as the result of Labour gains. At North Southwark on May 17 a former Liberal National majority of 79 was converted into a Labour majority of 1,493; and at Brecon and Radnor on August 1 a National majority of 2,169 became a Labour majority of 2,636. On September 8 it was announced that the political parties had agreed that, during the war, no by-elections should be contested, but that when a seat fell vacant a representative of the party previously holding it should be returned unopposed. There were 9 by-elections subsequent to this agreement, and in the case of two of these the party truce was violated and the election was contested. At the Clackmannan and East Stirling by-election, the result of which was declared on October 14, a Pacifist candidate entered the field, but polled only 1,060 votes against his Labour opponent's 15,645; and at Stretford (Lancs.) on December 8 the Conservative, elected with 23,408 votes, was opposed by an Independent Labour Party candidate who polled 4,424 and a Communist who polled 1,519 votes.

On April 14 the Select Committee issued its report on the question whether the Speaker should be required, when in office, to take part in a contested election. The committee was strongly in favour of continuing the present practice of contesting the Speaker's seat. The House of Commons Member's Fund Bill, which passed its third reading on July 25, provided for pensions for ex-members of the House of Commons, or their widows, who might be in reduced circumstances. A precedent of the World

War was followed on December 13, when a secret session of the Commons was held to debate on the organization of supplies for the prosecution of the war.

House of Lords.—At the close of 1939, 783 peers were entitled to sit in the House, viz., 4 royal peers, 2 archbishops, 20 dukes, 28 marquesses, 129 earls, 86 viscounts, 24 bishops, 461 barons and 16 Scottish and 13 Irish representative peers. Many of the most able of these, as holders of Crown appointments overseas, etc., are virtually debarred from attending, and of the remainder only about 10% actually do so, except on special occasions. Ten peerages became extinct during the year, and new creations were confined to two viscountcies and nine baronies.

On the outbreak of war Sir Thomas Inskip (created Viscount Caldecote) succeeded Lord Maugham (who was raised to a viscountcy) as Lord Chancellor; the Earl of Onslow (Chairman of Committees) and Lord Snell and the Marquess of Crewe (leaders of the Labour and Liberal Oppositions) retained their offices.

Parsons, William Edward (1872–1939), U.S. architect, was born at Akron, O., June 19. In 1905 he was appointed consulting architect to the U.S. Gov't in the Philippines. Later he helped design city plans for Chicago, Ill., Buffalo, N.Y., St. Paul, Minn., Washington, D.C., San Juan, P.R., and other cities. He died December 17 at New Haven, Connecticut. See *Encyclopædia Britannica*, vol. 17, p. 341.

Patents. Appraisal of the patent system as an economic factor has prompted congressional legislation designed to increase its efficiency and its value in the field of industry. The Temporary National Economic Committee commenced its investigations in Dec. 1938 with hearings on the use of patents by several industries. At the next session, Jan. 1939, proposals for changes in law and procedure were presented by the commissioner of patents, and testimony on the operation and benefits of the patent laws by inventors, scientists and industrialists. Bills relating to the recommendations of the commissioner were presented in Congress and some of them were enacted in August. Public Act No. 286 reduces the period of permissible publication and public use before an application for patent must be filed from two years to one year. Public Act No. 288 establishes a period of one year beyond which another applicant cannot copy claims from an issued patent for the purpose of interference. Public Act No. 287 simplifies interference practice by eliminating one of the several appeals allowed by law; the internal Patent Office appeal is abolished and the decision by the Office is to be made by a board of three examiners of interference. Public Act No. 341 gives the commissioner of patents authority to fix the time within which response to actions by the Office must be made. Renewals are abolished by Public Act No. 358.

A significant change was made in the patent law of France in July 1939, when the term of patents was increased from 15 to 20 years, counting from the date of filing of the application.

The most recent data and estimates available show that about 154,000 patents were granted by all the countries of the world in 1937. The number granted by some countries during that year were: Australia, 2,642; Austria, 3,800; Belgium, 6,166; Brazil, 1,034; Canada, 7,856; Czecho-Slovakia, 3,100; Denmark, 1,602; France, 16,750; Germany, 14,526; Great Britain, 17,614; Hungary, 1,920; Italy, 9,980; Japan, 4,615; Netherlands, 2,478; Norway, 1,340; Poland, 1,734; Rumania, 1,131; Sweden, 2,953; Switzerland, 6,447; United States, 43,271. In 1938 the United States granted 43,493 patents, and 49,080 were granted in 1939. The total number of patents granted by all the countries to and including 1937 can be estimated as approximately 7,500,000; however, these do not involve that number of distinct inventions

since numerous inventions are patented in a number of different countries.

(C. P. Co.)

Peaches. The 1939 peach crop in the United States was estimated by the Department of Agriculture as 61,730,000 bu., about 19% larger than the crop of 51,945,000 bu. in 1938 and about 14% higher than the ten-year average (1928-37) of 54,151,000 bushels.

Peanuts. The 1939 crop of peanuts for picking and threshing was 1,147,245,000 lb. in the United States, the Department of Agriculture estimated November 1. Production in 1938 was 1,309,400,000 lb., and for the ten-year average (1928-37), 989,014,000 pounds. Production in Manchoukuo was estimated at 165,000 short tons. In India a shorter crop was expected as the 1939 acreage was 6,869,000 ac., compared to 8,500,000 in 1938. Figures for the Chinese crop are not available and the volume of peanuts for export is conjectural because of currency problems.

Foreign observers reported it was difficult to sell peanuts for export in China because officials demanded that goods for export must be bought with the new paper money.

U.S. Peanut Production (Picked and Threshed), 1938 and 1939

smaller than the record crop of 32,473,000 bu. in 1938 and 20% above the ten-year average (1928-37) of 25,489,000 bushels. The Canadian crop was estimated at 584,300 bu., compared to 653,400 bu. in 1938.

(S. O. R.)

Pearson, Alfred John (1869-1939), U.S. educator and diplomat, was born in Landskrona, Sweden on September 29 and was taken by his parents to the United States in his infancy. At Bethany college, Lindsborg, Kan. he received his bachelor's degree in 1893 and his master's degree in 1896; in the latter year also Yale university granted him a doctorate of philosophy. In 1907 he was appointed professor of German language and literature at Drake university in Des Moines, Iowa. In 1924 President Coolidge appointed him minister to Poland, and the next year minister to Finland, a post he retained until 1930. Thereafter he was dean of the college of liberal arts at Drake university until his death at Des Moines on August 10.

Peat. The commercial production of peat is widely distributed, and in some European countries the output is of considerable magnitude. In 1935 the Russian output was almost 20,000,000 metric tons, but has since increased; Irish production is about 4,000,000 tons, Polish 2,000,000 tons; few others exceed 100,000 tons. In countries having a large peasant population the bulk of the output is used as a low grade, cheap fuel. In more heavily industrialized countries outputs are smaller, and uses include such items as soil conditioner, fertilizer ingredient, packing material and stable and poultry litter. About 76% of the 1938 sales in the United States were for soil improvement, out of a total output of about 46,000 short tons, supplemented by 69,500 tons of imported material, largely from Germany and Sweden.

(G. A. Ro.)

Pecans: see NUTS.

Pellagra. During 1939, observations from all over the world have confirmed the beneficial effect of nicotinic acid in the relief of the sore mouth, vomiting, diarrhoea and insanity of pellagra. Recent observations show that beriberi (neuropathy from lack of thiamin) and riboflavin deficiency (sores at the corners of the mouth from lack of riboflavin) frequently co-exist with pellagra. Hence, it is clear that all manifestations of ill health in the average pellagrins should not be attributed to the lack of a single vitamin. Studies reported from an endemic area show that pellagra is a common disease among infants and children, and that there is a relationship between the inadequate diet of the mother during pregnancy and lactation and the development of the pellagra in the infant and child.

The importance of nicotinic acid, thiamin and riboflavin in relieving pellagra and the associated beriberi and riboflavin deficiency is of general scientific and biological significance in that these three vitamins are building stones in the fundamental processes of biological oxidation and reduction. (See also DIETETICS; VITAMINS.)

Pennsylvania, one of the original 13 States of the United States, popularly known as the "Keystone State," area 45,126 sq.mi. (239 sq.mi. water); population (U.S. census, 1930), 9,691,350; estimate, July 1, 1937 by Census Bureau, 10,176,000. Capital, Harrisburg, 80,339.

Cities with a larger population (census estimates July 1, 1933) were Philadelphia, 1,972,700; Pittsburgh, 678,500; Scranton, 144,400; Erie, 118,300; Reading, 111,600; Allentown, 97,000; Wilkes-Barre, 87,000; Altoona, 82,000. Of the State's population 6,533,511 were urban, or 67.8%; 7,959,551 native white; 1,233,051 foreign born; and 431,357 Negro.

History.—The Republicans in the election on Nov. 7, 1939, carried the State for Marion D. Patterson, as chief justice of the Supreme Court, the highest court in the commonwealth. William H. Keller, president judge of the Superior Court, was re-elected without opposition, having been nominated by the Republicans and indorsed by the Democrats. Thomas J. Baldrige and William E. Hirt, associate judges in this court, were re-elected over Democratic opponents.

The General Assembly of which the Republicans gained control in 1938 at the same time that they displaced a Democratic governor, created a Department of Commerce and Richard P. Brown was appointed as its first head. He has been actively engaged in bringing new industries into the State. After an agitation extending over several years the General Assembly was induced to pass a law forbidding the sale of fireworks save for properly regulated public displays. A survey undertaken after the annual Fourth of July celebration disclosed that there had been no deaths from fireworks compared with eight in the previous year and that there were only 41 injuries as against 1,702 in 1938. Another new law directed that aliens more than 18 years old should register annually with the Department of Labor and Industry and should carry their registration cards with them to be shown on demand of the police. The validity of the law was contested in the United States courts on the ground that the subject was outside the jurisdiction of a State legislature. Late in November the Federal district court declared the act invalid for this reason. Among the acts dealing with labour was one which empowered the courts to issue injunctions against sit-down strikers and provided that employers as well as employees might petition the Labor Relations Board for redress of grievances. The right to reinstatement or to the payment of wages during the time a workman was on strike was denied to workers found guilty of unfair practice. Engaging in a sit-down strike was defined as such an unfair practice. The anti-injunction law affecting labour disputes was further amended so as to permit the issue of a restraining order when there is violation of a valid agreement or when employees engage in practices intended to coerce an employer. The act of the previous legislature intended to prevent a grand jury investigation of charges against executive officers of the State was repealed. The investigation which this law was intended to stop was continued and several officials were indicted. Roy E. Brownmiller, secretary of highways, was convicted of malfeasance and nonfeasance in office in connection with highway payroll frauds in Luzerne county and sentenced to one year in prison and fined \$5,000. He appealed and is out on bail. David L. Lawrence, Secretary of the Commonwealth, was indicted for conspiracy, blackmail and violation of the election laws. When tried late in the fall the jury found him innocent. Another indictment against him for violation of the election laws remains to be tried.

The validity of the graduated chain stores tax, levied by a previous legislature, was contested in court by companies operating the stores. The tax varied from \$100 to \$500 on each store, in-

creasing in amount with the number of stores operated. When the case reached the Supreme Court it was held that the law violated the provision of the State Constitution which directs that taxes must be uniform on the same class of property.

The leading officers are: governor, Arthur H. James; lieutenant-governor, Samuel S. Lewis; secretary of internal affairs, William S. Livengood; attorney-general, Claude T. Reno; treasurer, F. Clair Ross; superintendent of Public Instruction, Francis B. Haas; chief justice, William I. Schaffer.

Education.—On the passage of the Land Grant College act by Congress in 1862 the Pennsylvania State college, founded in 1855, was designated a land grant college. It is supported by Federal and State appropriations. In the intervening years it has grown so large and organized so many departments that a committee of the General Assembly has been appointed to consider changing its charter from that of a college to that of a university. Its plant has been enlarged with the completion in 1939 of five or six new buildings. It is co-educational and gives instruction to about 7,000 students with a faculty of 731. In addition to appropriations for the support of the State college appropriations are also made to the University of Pennsylvania, the University of Pittsburgh, Temple university, Jefferson Medical college, Hahnemann Medical college and the Woman's Medical college. There are in the State all told 56 colleges and universities, as well as 14 State teachers colleges and training schools. In addition there are 9,568 elementary schools with 1,258,619 pupils and 1,261 high schools with 651,128 pupils.

Banking and Finance.—On Oct. 2, 1939, there were 510 financial institutions in the State under the supervision of the Department of Banking, exclusive of 144 National banks with trust departments. The total resources of the State institutions on that date were \$3,193,895,975.93. The capital of the 510 banks was \$117,167,640.74 in common stock and \$24,637,379.67 in preferred stock. There were 3,786,912 depositors. The State institutions administered trust funds amounting to \$5,007,885,311.36. On June 30, 1939, there were in the State 694 National banks with a total capital of \$166,537,000, deposits of \$2,851,323,000 and assets of \$3,313,834,000. The estimated revenues of the State for the biennium of 1939-41 were \$376,519,000. Deducting the deficit on May 31, 1939, of \$49,767,867 there remained available for appropriation \$326,751,133. Of this amount \$326,750,352 was appropriated.

Agriculture, Manufactures and Mineral Production.—According to the latest agricultural census there are in the State 191,284 farms with an acreage of 15,855,343. The value of the land and buildings is \$861,706,599. The value of livestock, horses, cattle, mules, sheep and swine on Jan. 1, 1939, was \$143,837,000. The value of field crops for 1938 was \$11,431,800. The cash income from livestock and livestock products was \$190,145,000. The latest industrial statistics show that when compiled there were 17,947 establishments with an invested capital of \$4,339,415,500 employing 1,284,439 persons to whom \$1,145,400,200 was paid in wages. In addition there were 173,743 persons on salary, including officers and office employees, to whom \$381,247,400 was paid. The value of the output was \$6,583,979,900. The metal and mineral products were valued at \$3,058,279,700; food and kindred products, \$770,319,200; mine and quarry products, \$446,197,300; textiles, \$819,402,500; paper and printing industries, \$340,436,600; and tobacco and its products \$35,513,300.

Highways.—On May 31, 1939, there were approximately 99,000mi. of public highways, including 47,000mi. of second class township roads. There were 40,498mi. classified as State highways of which 30,675mi. were surfaced and improved. Of these roads 8,200mi. were concrete or other rigid pavement, and 20,555mi. with a bituminous surface. During the biennium ending May 31,

1939, the period for which appropriations are made, the Department of Highways spent \$159,040,753.18 in addition to large amounts spent by cities, boroughs, townships and counties on highways exclusively under their control. (G. W. Do.)

Pennsylvania, University of, opened its 1939-40 session with an enrolment of approximately 15,970 and a faculty of approximately 1,678. Dr. George W. McClelland, vice-president in charge of undergraduate schools, became provost, vice Dr. Josiah H. Penniman, who retired. William H. DuBarry, director of scholarships and student finance, became vice-president—assistant to the president. Dr. Paul H. Musser, dean of the college, became administrative vice-president, vice George A. Brakeley, who resigned to become financial vice-president of Princeton university. Dr. William E. Lingelbach, professor of modern European history, became dean of the college. Dr. A. Newton Richards, professor of pharmacology, became vice-president in charge of medical affairs, vice Dr. Alfred Stengel, deceased. John B. Thayer, university trustee, became treasurer of the university, vice F. Corlies Morgan, deceased. Dr. Arnold K. Henry, director of admissions, became dean of student affairs.

During 1940 educational institutions and eminent scholars in America and abroad will join the university in celebrating the 200th anniversary of its founding. An electrostatic generator was erected to further the research activities of the department of physics. Plans were completed for the addition to the university hospital of the Dulles and Agnew pavilions, which will contain 190 beds for patients, an X-ray department, operating rooms and research laboratories. The university museum conducted field expeditions in Iran, Cyprus, Armenia and Guatemala. There is continued activity in research throughout the 13 schools and affiliated divisions. (T. S. G.)

Permanent Court of International Justice.

The court was not very active during the year 1939, for only three cases came before it for decision. The year was also marked by a withdrawal from the obligations of article 36 of the statute (by which States agree to permit themselves to be sued without their express consent in each case) by Great Britain and other belligerents. In 1939 also a new election of judges should have taken place. But owing to the war in Europe the assembly and council of the League did not meet for this purpose but, by resolution, extended the tenure of the existing judges, under article 13.

In the Panevezys-Saldutiskis railway case, decided Feb. 28, 1939, Estonia sued Lithuania as the alleged successor in interest of a pre-1917 Russian railroad corporation, part of whose lines lay in each of the successor's States along the Baltic. Estonia based her claim on a treaty of 1920 with Soviet Russia which purported to grant rights over the Lithuanian part of the line, now reorganized as the Esimene company. Lithuania declined to recognize Estonia's right of succession or the Esimene company's title.

The court decided ten to four that the Lithuanian objections were well founded, that the injury, if any, was done to a Russian corporation at its origin.

A second case involved a suit by Belgium against Bulgaria

arising out of a dispute as to the application of an award of the Mixed Arbitral Tribunal established under the Treaty of Neuilly. That Tribunal had decided that a Belgian electric company in Sofia was entitled to restitution of its property seized by Bulgaria and a modification of its concession. Points in dispute were the price to be paid for coal and the exchange rate to be applied to Belgian francs, such francs having depreciated in 1935, and the amount of taxes due to the city of Sofia. Meanwhile the city of Sofia had brought its own action in Bulgarian courts. While appeal was pending to the highest court, a new income tax was decreed. Belgium then suggested international arbitration under a 1931 treaty with Bulgaria. The majority of the court, 9 to 5, decided in favour of Bulgaria, holding among other matters that the 1931 treaty could not defeat jurisdiction of the Permanent Court.

In the case of *Société Commerciale de Belgique* (Belgium) v. *Greece*, the claimant company was to be paid in bonds for the construction of railroads, such bonds to constitute part of the public debt (on which Greece defaulted in 1932). The court decided 13 to 2 in favour of Belgium.

The withdrawals by Great Britain, the Dominions and France from article 36 of the statute insofar as concerns questions arising in the course of the European war were explained by the statement that when the optional clause was signed it was assumed that article 16 of the Covenant would be carried out but that various nations had indicated their unwillingness to execute the Covenant, had in fact declared their neutrality in the war, and that hence Great Britain and the Dominions felt that conditions had changed and that it was inappropriate to permit article 36 to be applied to questions arising out of the European war. Greece, on the other hand, renewed its acceptance of the optional clause for a further period of five years with certain reservations. The Moslem countries, Egypt, Turkey, Iran and Iraq, petitioned the League for a jurist representing Moslem law. Liechtenstein appealed to the court against a decision of the Royal Curia of Hungary in 1932 in matters affecting Felix Gersiczy.

The outbreak of the war in 1939 and the removal of questions of belligerent and neutral rights from the jurisdiction of the court may further reduce the business of the court in the period immediately ahead.

(See also INTERNATIONAL LAW; LEAGUE OF NATIONS.)

Persia: see IRAN.

Peru, a republic on the west coast of South America; language, Spanish; capital, Lima; president, Dr. Manuel Prado y Ugarteche; the area, including some 100,000 sq.mi. of territory disputed with Ecuador, is officially estimated at 532,185 square miles. No census has been taken since 1876, but preparations were under way during 1939 to effect a complete census of the country early in 1940. Population estimates range from 6,600,000 to as high as 10,000,000.

The chief cities are: Lima, 650,000; Callao, 120,000; Arequipa, 100,000; Cuzco, 80,000; Trujillo, 70,000; Chiclayo, 50,000; Iquitos, 40,000.

History.—The most significant event in Peru during 1939 was the voluntary retirement of General Oscar R. Benavides, president and dictator since 1933, and the election of Dr. Manuel Prado y Ugarteche, in October, to succeed him. Dr. Prado, first civilian president in ten years, was inaugurated on December 8. Retirement of General Benavides had been forecast as early as February, when his minister of the interior, General Antonio Rodríguez, was killed in an abortive attempt to seize the presidency. President Prado pledged a "middle of the road" and democratic policy, but indications at the end of the year were that only mild and gradual modifications of the stringent Benavides policies

would be effected, as an estimated 800 to 1,000 political prisoners continued in prison, and many opponents of Benavides remained in exile.

Development of public works, a feature of the Benavides regime, was continued through 1939, with emphasis on highway and port construction. Five workers' housing projects were in process of completion in Lima, bringing the total there to ten. An extensive hospital building program was under way as part of the national obligatory social insurance plan. In Dec. 1939, the new Palace of Justice, one of South America's largest buildings, was completed.

In September, upon the outbreak of the European war, Peru declared strict neutrality. To ease the economic dislocation caused by the war, decrees were issued against profiteering.

Education.—Peru had 5,826 elementary schools, with 10,615 teachers and 683,201 pupils, in 1939, a marked advance since 1933, when there were 3,714 schools, 6,624 teachers and 367,404 pupils. Secondary schools totalled 216, in addition to technical schools of agriculture, animal husbandry and forestry. The five universities include the University of San Marcos at Lima, oldest in America.

Finance.—The monetary unit is the sol (value: approximately 17 cents U.S.).

Trade and Communication.—Peru has good sea communications and excellent air transport service to foreign countries, supplemented by rail connections with Bolivia and northern Chile. There are around 2,600mi. of railways and a well developed interior air service. The highway system, 25,000km. in extent, includes 13,659km. of asphalted roads. During 1939 the Lima-Arequipa section of the Inter-American highway, 1,200km. in length, was opened to traffic, and the highway linking Lima with the Amazon basin across the 16,000-ft. Continental Divide (said to be the highest improved road in the world) was carried as far as Pucallpa in eastern Peru.

Peru's imports are mainly foodstuffs and miscellaneous manufactured goods. Exports are largely petroleum, cotton, metals and sugar. In 1938 imports aggregated 260,159,000 soles in value, a 10.6% increase over 1937, and were derived principally from the United States (34.3%), Germany (20.6%) and Great Britain (10.1%). Exports for 1938 declined 6.8%, after six years of steady increase, and totalled 342,128,000 soles (United States, 26.8%; Great Britain, 19.9%; Germany, 10.5%). During the first eight months of 1939 imports were 165,651,640 soles (a 2% drop), and exports 242,667,405 soles (a 19% gain). Heavy declines in both were registered in the last four months, due to European war conditions.

Agriculture, Mineral Production.—In 1937, 1,463,867 hectares (approximately 3,500,000ac.) were under intensive agriculture. The chief agricultural products are: cotton, cane sugar, rice, tobacco, coffee, corn, coca and vegetable ivory. In 1938, 69,565 tons of cotton and 260,182 tons of sugar were exported. Guano (1938 production: 320,000 tons) is likewise an important product. Peru is second in petroleum production in South America and tenth in the world (17,000,000bbl. annually), and leads the world in vanadium and bismuth production. Silver, gold, copper, tungsten, lead, antimony, zinc and other minerals are produced in quantity.

Pests, Agricultural: see ENTOMOLOGY.

Petrol: see GASOLINE; PETROLEUM.

Petroleum. The outstanding event of 1939 affecting world petroleum was, of course, the war in Europe. Petroleum is a war essential of major importance. Armies and navies of warring countries must have assured and increasing

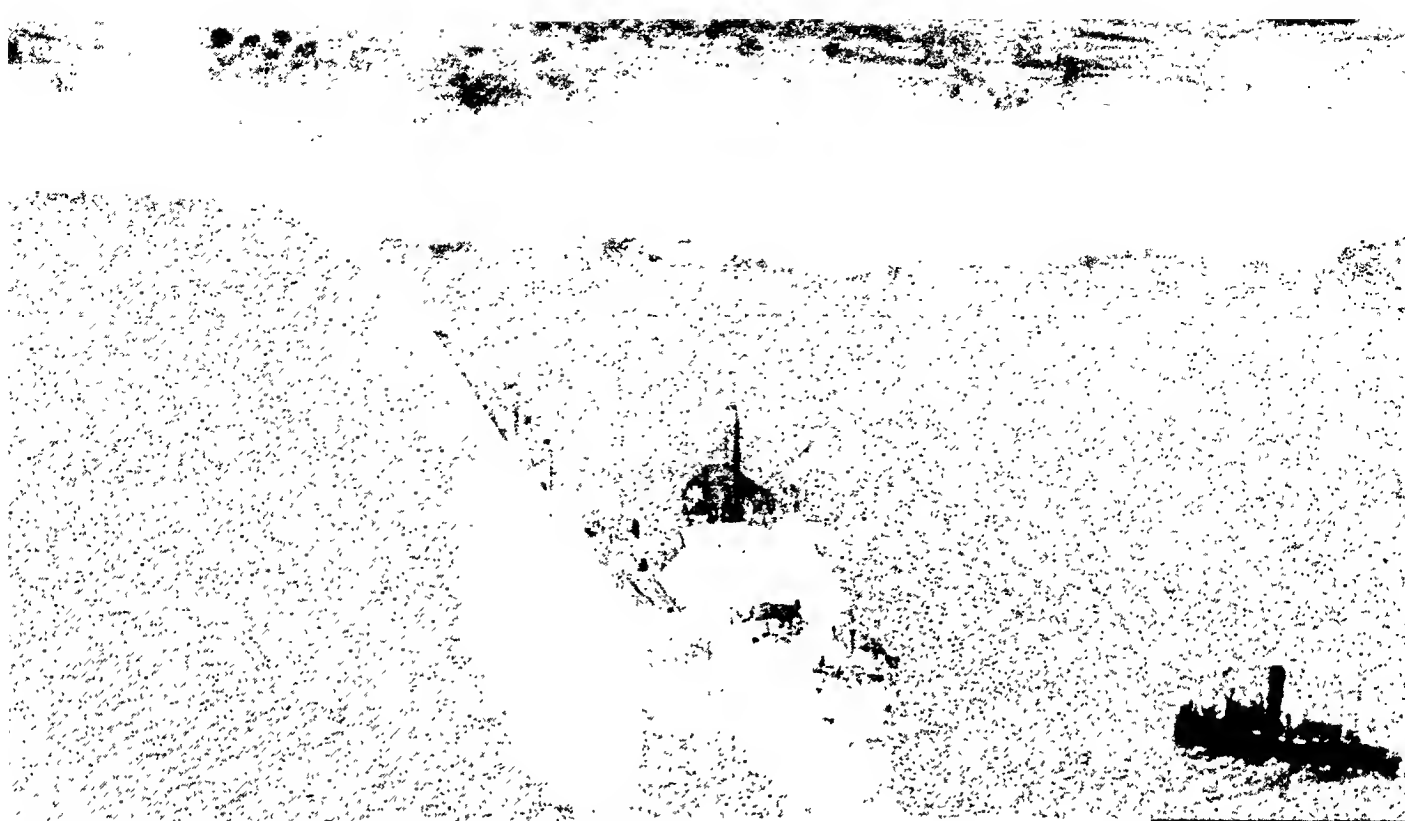

supplies of motor fuel, aviation gasoline and fuel oil. Manufacture and transportation dealing with materials and products entering directly or indirectly into war usage also demand increasing petroleum requirements in war-time. To offset this accelerated demand, civilian or non-military consumption of petroleum products is restricted. For instance, in Germany, France and England, in all belligerent countries and even in some neutral European countries, civilian use of gasoline in motor cars either is wholly or partially banned.

Petroleum products are listed as contraband by all belligerents. The economic blockade of Germany by the Allies has cut Germany off from the petroleum sources normally available to her by sea transportation, such as the United States, Mexico and South America. At the same time, tankers bringing petroleum to the British Isles are a special target of U-boats in Germany's own blockade of her enemies. Great Britain, France and Germany each have but an insignificant home production of petroleum and each are dependent upon outside sources for petroleum supplies. Whereas a completely effective sea blockade by Germany would cut off all outside supplies from Great Britain and France—a not likely possibility—the Allied blockade cannot stop Germany from getting petroleum from the principal oil-producing countries of Europe. In her conquest of Poland, Germany has acquired the Galician oil fields; she normally imports about 25% of Rumania's production of petroleum products, and she has as a friend Russia, the second largest oil producing country in the world.

But Russia, despite her high ranking, produces only 10.23% of the world's petroleum; Rumania but 2.44% and Poland but .19%. The Allies, on the other hand, if they can keep their own sea lanes open, theoretically, at least, can draw upon close to 87% of the world's petroleum production. They have open to them the United States producing 61% of the world's petroleum; Venezuela and other South American oil sources, as well as the great producing areas of Iran, Iraq, India and the East Indies which they have greatly developed in recent years. The principal problem of the Allies is one of transportation. The British have a large and adequate tanker fleet.

Authorities estimate that Germany's war-time petroleum requirements run at the rate of 75,000,000 to 89,000,000bbl. annually, whereas her own production of petroleum, Poland's entire production and Germany's imports of Rumanian oil amount to only something over 30,000,000 barrels. Added to that is Germany's production of synthetic gasoline from coal and lignite, unofficially estimated at 12,750,000bbl. in 1938, a five-fold increase over 1933. How much Russian oil is available to Germany is problematical, as normally Russia produces not much more than enough for her own needs and with herself engaged in war those needs would be aggravated. Also transportation of Russian oil to Germany is no easy matter. While it would seem Germany's position in the matter of petroleum supplies is far from com-

THE FIRST OIL BEGAN TO FLOW early in Nov. 1939 from the huge Barco concession in Colombia through a 263-mi. pipe-line to the sea at Coveñas, where it was loaded into U.S. tankers

portable, it cannot be called serious at this stage of the war, inasmuch as Germany long has been accumulating a petroleum reserve, estimated between 35,000,000 and 40,000,000bbl., and also is greatly expanding her output of synthetic gasoline. Near Stettin, in north-eastern Germany, she is building the largest synthetic gasoline plant in the world to convert oil residues and coal from Silesian mines into motor fuel. This plant will be larger than her Leuna plant, with a capacity of about 3,000,000bbl. annually. Initial output will begin about the middle of 1940 and the entire plant will be completed the following year.

If Germany built up large oil reserves, the same probably is true with respect to England and France. In view of this, together with the fact that the outside sources of all belligerents have not been completely severed, the immediate position of all major warring countries with respect to petroleum would not seem to be critical. The effectiveness of blockades and of transportation will tell the story, and a long-drawn-out war may mean a changing picture wherein petroleum will be the decisive instrument of the war.

After the World War it was said by Lord Curzon that the Allies "floated to victory on a flood of oil." That flood came chiefly from the United States and Mexico. The dependence of Europe upon American oil is proportionately smaller today than back in 1914-18, because of the development of Iraq, Iran and East Indian oil fields, but quantitatively it continues to be enormous. Also America has a great tanker fleet. Under the present Neutrality Act, American tankers cannot ply in belligerent waters. A few American tankers were transferred to Panama registry, but it still has to be clarified (Jan. 1, 1940) whether transfer of American ships to foreign registry will be permitted as a general policy. Oct. 1939, exports (latest available figures) of gas oil and fuel oil and of motor fuel from the United States showed a considerable increase over the corresponding month of 1938, but the 10-months' figures for these and other petroleum were lower. It is reasonable to expect that there will be greatly increased demand on the part

of the Allies for United States and South American oil, depending upon the availability of tanker tonnage.

Japan is a heavy buyer of United States oil, particularly California oil. Despite the fact that Russia is considered self-sufficient with respect to oil, approximately 1,000,000bbl. of low-grade gasoline was shipped from California to Vladivostok in 11 tankers between Aug. and Oct. 1939. During the regular session of Congress in 1939 Japan's aggression in China caused a resolution to be introduced in the Senate for an embargo on petroleum products, scrap iron and other materials to Japan, but was not acted upon as it was pointed out that such an act would be in violation of a trade treaty with Japan, expiring Jan. 26, 1940. What the fate of this treaty will be when it comes up for renewal is not known at the present time (Jan. 1, 1940). President Roosevelt's declaration for a "moral embargo" on Russia, following the Soviet Government's invasion of Finland, may stop further American oil sales to Russia. America tried "moral suasion" to shut off oil shipments to Italy when she invaded Ethiopia.

The European war had an immediate repercussion in Mexico, the Government of which in 1938 had expropriated all foreign oil properties for Government operation, and in 1939 had contracted to sell Germany oil in exchange for oil well machinery and other supplies. As a result of the expropriation of British, Dutch and American properties and the actual or virtual banning of oil trade to those countries, Mexico had sought a market for her oil in other quarters. The war and the blockade of Germany deprived her of her principal customer. Mexican Government representatives then sought to reopen oil trade with the United States. Formal action was taken at the annual meeting of the American Petroleum Institute asking the United States Government to ban the shipment of Mexican oil into the United States. Late in 1939 the Mexican Supreme Court sustained the Mexican Government's seizure of American, British and Dutch-owned oil properties. Diplomatic representations for the return of the properties continued in 1939. The Mexican Federal Court in December issued citations to all expropriated oil companies calling on them to appoint experts to confer with Government experts for the purpose of estab-

lishing the value of the expropriated properties, or in other words the amount of compensation the Government should pay the companies. The companies were considering their attitude; the general opinion being that they would not comply lest this action imply acceptance on their part of a *fait accompli* of expropriation.

A reciprocal trade agreement between the United States and Venezuela announced by Secretary of State Hull, cutting in half the excise tax of 21¢ per barrel on U.S. imports of Venezuelan crude and fuel oil and made provisionally effective Dec. 16, 1939, drew fire from the American petroleum industry. The excise tax was established at the insistence of American oil producers in the Mid-Continent field who demanded protection against the flood of Venezuelan and Mexican oil.

While the dislocation and readjustment necessitated by the European war has been the chief occupation of the American oil industry, domestic problems having to do with control of production continued to be acute. In Aug. 1939 there was a two-weeks' shut down of production in Texas initiated as a protest against declining price. Agitation continued for Federal control, instead of the present decentralized regulation by State authority and common council under the Interstate Oil Compact plan. Hearings on the Cole bill for Federal control were held. In October President Roosevelt once more endorsed the principle of controlling America's oil production through State compacts, and did much to allay fear of passage of sweeping Federal control legislation by the 1940 Congress. One of the chief criticisms against State compact regulation is that all oil producing States are not members of the compact, notably California and Illinois. California regulates its production voluntarily. Illinois became an important oil producing State only within the last year, and, under competitive drilling, has consistently produced above the estimated demand. In 1939 Nebraska became an oil producing State for the first time with a well near Falls City having a reported potential production of around 150 barrels. Test wells in Missouri, Iowa and Mississippi indicate that other new States will come into production soon, with the usual result of unrestricted, competitive drilling. States just opening up oil production are reluctant to pass regulatory measures restricting such production. This situation may furnish more ammunition for those who believe that only by Federal regulation can production in the United States be adequately held under control. The question of control may become more pronounced as the European war continues and assuming that there is heavy drain on American oil sources by European belligerents. In the meantime the war has tended to speed production and refinery developments in the United States. (See also FULLER'S EARTH; ILLINOIS: Oil; MEXICO: History.)

"Phenix": see FRANCE: History.

Philadelphia, third largest city of the United States (pop., 1,972,700, census estimate 1933) suffered the loss of its mayor, S. Davis Wilson, by death (August 19), and from the lack of a leader in its city hall, for the eight months in 1939 its chief magistrate was ill. Under the City Charter, George Connell, President of City Council, took over the mayor's duties after Mr. Wilson notified him (August 11), he was "temporarily freeing" himself in order to hasten his recovery.

The year 1939 will be remembered as the one which passed two budgets. On August 10, the budget for 1939 was passed, eight months after the legal time; and on December 15, that for 1940 was passed, and the announcement made that it was balanced. It

totalled \$82,386,461.40. The budget for 1939 was \$112,087,904, the largest in the city's history. In order to clear up the debt which had tangled the city's finances, on August 1 the city "sold" its gas rentals to a syndicate for the next 12½ to 18 years, for \$41,000,000.

At the November election, Judge Robert E. Lamberton was chosen mayor, and immediately he recommended to City Council some vast changes in the city's budget, suggesting many economies in personnel, streamlining the police and fire departments; proposing needed modern apparatus for the latter; suggesting early retirement age for police and firemen, and placing both in two classes, the younger receiving higher pay.

On December 13, City Council in a new effort to keep the budget balanced, passed a tax of 1½% on all wages. A 3% sales tax was defeated earlier in the year, as was a 1½% income tax.

After five years of litigation, November 14, the Federal Court put a final O.K. on a reorganization plan for the city's transit system, which was scheduled to go into effect on Jan. 1, 1940. This plan will unify the Philadelphia Rapid Transit Company, under a single operating corporation, and is designed to save the company millions of dollars in overhead expenses, and make possible an extensive program for improving the service by the addition of hundreds of modern trolley cars, buses, and trackless cars. The most surprising feature of the plan for the new Philadelphia Transportation Company, has been the elimination of the underliers, whose rentals took \$9,000,000 a year out of the transit system's treasury. The new company is to be capitalized at \$85,000,000. U.S. District Court Judge George A. Welsh, who approved the plan, said the work "cannot be equalled in legal annals." (J. JAC.)

Philately. The year 1939 marked the close of the first century of postage stamps. The outbreak of the war in Europe forced cancellation of the Centenary exhibition that was scheduled for May 6, 1940, in London. During the year, there were issued 2,345 new stamps, of which 1,574 were for purely postal purposes, including commemoratives, 341 airmail stamps, 255 semi-postal (for charitable or extra-official purposes as well as postage) and the remaining for various services, such as postage due, special delivery, official mail, registry, etc.

The War.—The first issue from the war-zone was a surcharged lot from Danzig, announcing its "freedom." Special issues for Moravia and Bohemia, Slovakia and the Carpatho-Ukraine districts were undoubtedly under way before the war, but appeared in increased number after the mobilization. What has happened to the Polish stamps is unknown, as no mail is coming out from the occupied districts.

Commemoratives.—The United States issued the usual run of commemoratives. The World's Fairs at San Francisco and New York each received a single three-cent value; the centenary of baseball received a surprise acknowledgement of a similar value portraying a sandlot game; the sesquicentenary of the inauguration of Washington as president was commemorated and the 25th anniversary of the Panama canal was recognized in a three-cent issue. The Canal Zone issued a full set of commemoratives for this latter anniversary. Establishment of the printing press in America and the statehood of four States—the Dakotas, Montana, and Idaho all on one stamp—were likewise remembered.

Inauguration of transatlantic mail brought a new United States airmail stamp, a 30¢ value to cover the single-letter rate for that service.

The World's Fairs stimulated a number of foreign Governments to "commemorate" activities of the United States. For San Francisco, Salvador issued a modest three-stamp set, while Ecuador produced two sets of seven each (airmail and regular postage).

Nicaragua issued one set of seven for both fairs. For New York, France issued one stamp and a set of postcards, while 26 French colonies each issued two, and Algeria four. Seven Portuguese colonies each issued a single stamp, and Portuguese India issued two. Iceland had a set of three and a souvenir sheet; Ecuador two sets and the Dominican Republic a set of five; Brazil four; Mexico five; Rumania and Russia two each; the Netherlands and Poland, one each. Czecho-Slovakia, which had constructed a pavilion before partition, helped finance it by selling specially overprinted souvenir sheets. Mexico commemorated the World-Wide Philatelists convention at Tulsa, Oklahoma, with a stamp, and Nicaragua paid tribute to Will Rogers with a short set. China and Turkey also issued sets for the sesquicentenary of the U.S. Constitution, the Turkish set also paying tribute to the New York World's Fair.

Among the many commemoratives issued during 1939, the attractive set of three bi-coloured stamps by Canada for the visit of George VI and Elizabeth was outstanding.

The Republic of Hatay, formerly the Sanjak of Alexandretta, lived long enough to issue two sets of stamps before becoming a part of Turkey.

The philatelic truck of the United States Post Office Department visited New England and the North Atlantic States in 1939, heading southward in the fall. An interesting souvenir of its visit, obtainable only by actually entering the truck, is an engraved picture of the White House, printed on the small press that is part of the exhibit. The department has asked an appropriation for more of these trucks, which show the various issues of U.S. stamps as well as the methods of stamp-production.

"Heroes of Peace" Issue.—During 1939, the United States Post Office Department announced the long-discussed "Heroes of Peace" issues. There will be seven series, each having five stamps of 1¢, 1½¢, 2¢, 3¢ and 5¢ values. The series are devoted to American authors, poets, artists, educators, inventors, composers and scientists. Those who have been chosen to represent these classifications are: Authors—Ralph Waldo Emerson, Samuel L. Clemens (Mark Twain), Washington Irving, Louisa May Alcott, James Fenimore Cooper; Poets—Henry W. Longfellow, James Whitcomb Riley, Walt Whitman, John Greenleaf Whittier, James Russell Lowell; Artists—James Abbott McNeill Whistler, Daniel Chester French, Augustus Saint-Gaudens, Frederic Remington, Gilbert Charles Stuart; Educators—Horace Mann, Charles W. Eliot, Booker T. Washington (the first Negro to appear on a U.S. stamp), Frances E. Willard, Mark Hopkins; Inventors—Alexander Graham Bell, Eli Whitney, Samuel F. B. Morse, Elias Howe, Cyrus H. McCormick; Composers—John Philip Sousa, Edward A. MacDowell, Stephen Collins Foster, Victor Herberth, Ethelbert Nevin; Scientists—Luther Burbank, Dr. Crawford W. Long, Dr. Walter Reed, John James Audubon, Jane Addams. The new series will appear in 1940.

Literature.—Scott's Standard catalogue signalized the second century of stamps by a change in its make-up for the 1940 issue—which appeared in Sept. 1939. The main change is a rearrangement of the numbering. All special-usage stamps, including semi-postal, registrations, special delivery, parcel post, occupation, official, postage due, offices abroad, airmail and the like, are given prefixes of letters in the numerical listing. Following the lead of Stanley Gibbons' (British) Catalogue, the new edition differentiates between two hitherto interchangeable words—"surcharge" and "overprint." It also begins the practice of indicating the method of production of the stamps—printing, typography, or lithography—and the manufacturer.

Exchange of stamps between countries, which has always had a certain amount of complication because of exchange and duties, was simplified by the United States with the removal of the "cus-

toms fee" on Aug. 1, 1939, formerly assessed on duty-free packets of stamps. However, in Germany, previous to hostilities, even simple exchanges between collectors had to pass through a central office, to prevent fictitious exchanges to create foreign balances.

Personnel.—The death of Major Guy W. A. Camp of Indiana, former president of the Society of Philatelic Americans, was a serious loss to philately in 1939. The Crawford Medal, awarded annually by the Royal Philatelic Society of London, again went to an American—Max Johl of New York—for his series of hooks on the 20th century issues of the United States, which he initiated some years ago with the late Beverly King. (M. HA.)

Philippines, Commonwealth of the.

The Philippine islands, over 7,000 in number, south-east of China, entirely in the tropics; capital, Manila; U.S. high commissioner, Paul V. McNutt (until July 1939), Francis B. Sayre; president, Manuel Quezon; vice-president, Sergio Osmeña; resident commissioner at Washington, Joaquín Miguel Elizalde, who replaced Quintín Paredes; status in 1939, that of an unincorporated territory, until July 4, 1946, under constitution provided in the Tydings-McDuffie Independence Act; national assembly, unicameral. During the period of the commonwealth, all legislation affecting currency, coinage, imports, exports and immigration requires approval of the President of the United States; the U.S. is in control of foreign affairs; and all decisions of local courts are subject to review by U.S. Supreme Court. Area, approximately 114,400 square miles. The 1939 census showed a population of 15,984,247 as against 10,314,310 in 1918 and 7,635,426 in 1903. The earliest (1794) figures were 1,502,574. Only two complete Spanish censuses (1877 and 1887) were taken. The annual immigration quota (now reduced to 50) to the United States was filled by April 28, and no further visas were issued to non-preference applicants; while it was expected that the preferential quota would be exhausted during the fiscal year 1938-39.

History.—The first regular session of the second Commonwealth legislature (now unicameral) closed on May 18, 1939, with 170 bills passed. Meanwhile a movement, whose objective is expressed by the phrase "continue the commonwealth," had been promoted by certain Filipino groups, including land owners, merchants and even labourers, but whose numerical strength has yet to be disclosed. One of them, the Commonwealth Assn. Inc., reported 3,000 members by May, in central Luzon and the Visayas. A delegation from another group called on President Quezon, August 30; among them was labour leader Esteban Vazquez who declared "over and above independence we love liberty." The president was reported as listening attentively and remarking that "not all who talk of independence are the real patriots." Former High Commissioner McNutt, who resigned in July, has stated publicly that the Filipino leaders "were agreed that complete independence is not possible under present Far East conditions and have altered their position accordingly"; but a mildly phrased resolution, with a similar trend, drew only seven votes in the legislature, as against 53. Among the measures enacted were one for an "Agricultural and Industrial Bank"; a Naturalization Act, removing restrictions against orientals, but requiring knowledge of English, Spanish or a native dialect; various acts relating to public lands, including one for the reopening of judicial proceeding affecting them; but proposals for constitutional amendments to revive the bicameral legislative system and to change the presidential term to four years, permitting re-election, were postponed. President Quezon has expressed himself differently on several occasions, as regards the second of these proposals; his leading opponent, Gen. Aguinaldo, opposes all constitutional amendments "for the present."

Serious agrarian troubles marked the early part of 1939 in central Luzon, between landlords and peon tenants. In Pampanga province during March an encounter of 500 of the latter with vigilantes (special police) sent to maintain order, resulted in injuries to 20 of the striking tenants. On May 9 President Quezon placed two municipalities under constabulary control and later went to his own Pampanga hacienda and made a speech of appeasement to his tenants. In Bulacan province, the tenants organized under Juan Rustia, local lawyer, and refused to pay rent, denying the alleged landlord's claim to ownership. Rustia likewise represents two Bulacan municipalities claiming title, in behalf of their inhabitants, to nearly 70,000ac. of land which, they allege, was wrongfully appropriated by representatives of the dominant church. The case is now pending in the United States Supreme Court. In Nueva Ecija province, during August, strikes were called by both tenants and public works labourers. The unification of Filipino labour under a single governing unit had been announced on May 16.

At the trial in Aug. 1939 of Benigno Ramos, for sedition in leading the "Sakdal" uprising in 1935, a letter, purporting to have been written by him from Japan, where he had taken refuge, was introduced by the prosecution. It directed his followers to capture Governor-General Murphy, the archbishop of Manila "and other Americans," annihilate the constabulary and burn the "entire city of Manila." Ramos' followers are estimated at 100,000 and he had announced his candidacy for president to succeed Quezon. He is also said to have given the assurance that "the Japanese are willing to help." Fear of Japan's designs is growing; for the Philippines lie in the direct path of the former's expansion southward to the East Indies, believed to form a part of Japan's "new order in Asia," which includes the expulsion of all Western powers, leaving Japan in full control.

On July 26, Francis B. Sayre, assistant secretary of State was appointed to succeed High Commissioner McNutt and sailed for his post in September. He had been active in securing tariff legislation which the Filipinos desired and was warmly welcomed in Manila. The Bureau of Insular Affairs which, since its establishment early in the century, had been the liaison agency between the Federal and Philippine Governments, functioning under the War Department was transferred to the Interior by the President's second Reorganization Order and now becomes a section of the Territorial Division.

Education.—Because the Filipinos are a congeries of many distinct groups, each with a distinct language or dialect (there are as many as 55 languages and many more dialects) they have no common native language. When the U.S. Government launched its great educational project there at the turn of the century, one of its chief objectives was to give them a common language by "making them literate in English." So well did it succeed that a far greater number of Filipinos learned English in the 40 years of American rule than had ever spoken Spanish at any one time during the nearly four centuries of Spain's domination. The Philippine Constitution (XVII, 8) recognized and perpetuated that objective by providing:

"The Government of the Commonwealth of the Philippines shall establish and maintain an adequate system of public schools, primarily conducted in the English language . . ."

It was, therefore, a distinct surprise for the many Americans who gave their best years to the Philippine educational service, to learn that Jorge Bocobo, the recently appointed secretary of Public Instruction, had given orders to teachers to use the native dialect in each locality as an "auxiliary" medium of primary instruction. This is a reversal of the 40-year plan of teaching the Filipino child English from the start and using it alone as the medium for instruction in all subjects. The result of the change will

probably be to prevent the child from ever learning English thoroughly and will certainly tend to perpetuate the dialects, whose elimination is indispensable to the formation of anything approaching "a national language." Mr. Bocobo was educated in the United States, but his highly nationalistic attitude sometimes becomes fantastic—as when he declared publicly that no Filipina (girl) should accept a marriage proposal unless made in her native dialect. Those dialects have no literature worthy of the name and all text-books would need to be translated into them at an enormous expense of time and money, and meanwhile the present generation of school children would wait in vain for even an approach to an education. It is interesting to note, however, that, following defeat in 1938 of the efforts to force religious instruction in the public schools, two prominent Filipinos, both American trained and who had opposed that attempt, were appointed to educational posts in the Philippine Government; Camilo Osias as chairman of a committee to study other educational systems, and Dean Francisco Benitez of the Government university, as director of Private Education, including sectarian schools. A bill to remove the university to a site outside of Manila was passed by the legislature, allegedly on the advice of two American educational advisers, who stressed the larger campus and room for expansion. Critics point out the disadvantages to students working in Manila, many of whom it is feared will be diverted to private institutions within the city, thus lessening the opportunity of the Government university to train the country's future leaders—which was one of the chief objects of its foundation.

Religion.—The Philippines afford a museum—not alone of diverse languages and peoples, but of religions also. The primitive groups, like the Ifugao in north Luzon and the Manobos of the South, are still animistic, believing in spirits and magic, especially witchcraft—a belief likewise retained by many "Christianized" Filipinos. In the great southern island of Mindanao, are thousands of Mohammedans—the results of missions which long antedated the Spaniards. In the lowlands, dominated for over three centuries by Spain, a majority of the population is at least nominally Roman Catholic but Protestant missions have been active since the beginning of the century, the Methodists leading. Contemporaneous with the revolution against the Spanish Government, under which church and State were united, there was a secession movement from the Roman Church, led by Gregorio Aglipay, a former native priest, which assumed formidable proportions and occasioned a large volume of litigation over ecclesiastical property, especially churches, held by the Roman Catholics but claimed by the Aglipayans. The latter's founder, still active, though at an advanced age, was visited early in 1939 by Dr. Louis C. Cornish of Boston, president of the International Association of Liberal Churches who was proclaimed honorary president of the "Independent Philippine Church" (as the Aglipayan body is officially styled) succeeding in that capacity the late William H. Taft. Dr. Cornish describes his experiences in a series of interesting letters to the *Christian Register* (vol. 118). He estimates the present Aglipayan membership at from 2,000,000 to 2,500,000 and to the charge that it "is composed mostly of labourers," he counters, "this is its glory."

Trade and Communication.—In 1938 imports to the Philippines from the United States reached \$90,357,000, being 68% of the total and an increase of 42.5% over those of 1937. The most important item in the gain was cotton piece-goods, displacing imports thereof from Japan, which declined 26%. During the first five months of 1939, imports from all countries declined 44% from the same period of 1938, being \$37,789,458. Exports to the United States from the Philippines reached 85% of all, which amounted to \$55,495,457. For the first five months of 1939 the total exports were \$56,670,390. A House bill passed by the U.S.

Senate on August 3, substitutes quotas, effective 1941-44, but decreasing 5% each year, for the present export taxes on scrap tobacco, cigars, coco-nut oil, sugar, pearl or shell buttons, cordage and embroideries. A joint congressional committee, to sit with a group named by the President, in 1944, will consider and report on future economic and political relations between the United States and the Philippines.

During the first quarter of 1939 Philippine mines yielded \$8,344,725 worth of gold, a gain of 14% over the corresponding period of 1938. In that year the Philippines had attained the sixth place in the production of the baser metals, notably iron. A new tax code, thoroughly revising the Philippine internal revenue system, designed to correct inequalities and to relieve the poorer classes, but nevertheless to produce an additional \$4,500,000 in revenue for the fiscal year, 1939-40, was adopted by the legislature on May 13. For the same period, President Quezon asked \$4,000,000 for public works.

BIBLIOGRAPHY.—W. L. Schurz, *The Manila Galleon* (1938), is an interesting product of 27 years of study of this famous craft, which, for two and one-half centuries, plied between Acapulco and the Philippine capital, affording the sole official link with the governing power, the Philippines being then an adjunct of Mexico. William H. Anderson (40-year resident of the islands), *The Philippine Problem* (1938), traces the history of the American occupation and opposes retention. An unusual amount of space in the periodicals for 1939 was devoted to the Philippines. (C. S. L.)

Philosophy. The violent rupture and resort to arms that marked 1939 had their philosophical aspects. On the one hand was a political and social monism, called the totalitarian state. On the other was the pluralism often associated with democracy. It is easy to over-simplify a conflict of this scope, intellectually as well as emotionally. In this particular conflict an effort to draw philosophical lines of cleavage is likely to be more than usually misleading, since the ideological issues are more than usually confused. The causes of the war, indeed, may well have been more in competitive interests that are not peculiar to the recognized philosophies of either side but reside in the structure of modern industrial and urban life wherever it is found. Nevertheless the war may be said to be very roughly a violent demarcation between the more centralized, tightly organized systems and the empirical, experimental point of view. It is roughly a conflict between authoritarianism and experimentalism.

In the more limited world of philosophical writings several events of importance have taken place. The logical positivists and semanticists have continued their discussions and publications. The New Thomists, particularly through the writings of Mortimer Adler in *The Thomist*, have maintained the fires of their scholastic renewal. The naturalists and the pragmatists, with the great figure of Dewey at their head, have continued their march. A fourth tendency of importance has been the more generalized effort made on various levels to integrate the different fields of human interest and activity. In this centrifugal modern world this effort has a philosophical function, if not always a philosophical terminology.

In this connection the continued publication of the *International Encyclopaedia of United Science* under Neurath is important. Four new volumes, *Principles of the Theory of Probability* by Ernest Nagel, *Foundations of Logic and Mathematics* by Rudolf Carnap, *Linguistic Aspects of Science* by Leonard Bloomfield, and *Theory of Valuations* by John Dewey, continue the emphasis on semantics, positivism, and pragmatism that marked the first year of publication. Two more volumes have been added to a group designed to consider various ideologies, skills, and special knowledges in the light of each other and to find bases for common action. These are *Politics and Public Service* by Leonard D. White and T. V. Smith, and *Agriculture in Modern Life*, by O. E. Baker, Ralph Borsodi and M. L. Wilson. *Geist und*

Sein by Herman Schmalenbach is the first volume of *Philosophia Universalis*, a series by well known European philosophers. *Knowledge for What* by Lynd is a brilliant criticism of the particularism of modern science and research and a demand that value judgments and programs for action be introduced into the disciplines of social science and intellectual life.

Not the least important of 1939's philosophical events is the reception, critical and expository, of Dewey's logic as stated in his theory of inquiry. A pragmatic logic in which logical forms are treated as postulates and logical process as little more than methodology is bound to run afoul both of rationalistic and realistic metaphysics. This conflict is described by Piatt in *The Philosophy of John Dewey*, volume one in *The Library of Living Philosophers* edited by Paul A. Schilpp. In the same volume the logic of Dewey is criticised from a dominantly rationalistic point of view by Bertrand Russell. The pragmatists' thesis, according to Piatt, is, first, that the given is a set of real and recognizable features of the perceptual environment. Inquiry, second, can so control the given as to establish reliable features within it as data or signs for inference to what is not given. If these be true, it follows, third, that we can so modify the perceptual situation given as to reveal what is there apart from the perceiving subject. Meaning from the pragmatic point of view is a functional relationship between things as signs and other things as signified.

This logic founded in behaviour and expressed in the verbally imprecise language of action, pressure, organic change, is sharply criticised by Russell. Dewey's interest in the continuity of any situation, its unbroken movement and change, and his insistence that logic or inquiry has for its purpose not to describe the world but to change it, is analysed by Russell with considerable severity.

The pragmatists' position, he says, is a product of a limited scepticism supplemented by a surprising dogmatism. If Russell's criticism on the face of it has what the pragmatist might call an undue faith in verbal logic, which really is a faith in the correspondence between symbolic processes and the real situation, there is behind his logicisms a deep resistance to Dewey's emphasis on the essential transitivity or practicality of action. There is in activity, says Russell, peace as well as yearning; there is rest, ecstasy.

Among other philosophical books of the year are Husserl's posthumous *Erfahrung und Urteil: Untersuchungen zur Genealogie der Logik; Language and Reality* by W. M. Urban; *Charles S. Pierce's Empiricism* by J. Buchler. Also may be noted: *The Decline of Mechanism in Modern Physics* by A. D'Abro; *Art is Action* by Baker Brownell; *Types of Religious Philosophy* by E. A. Burt; *Freedom and Culture* by John Dewey; *L'épithymologie* by Jean Urban. (B. B.)

Phosphates. Mineral phosphates, chiefly phosphate rock, a phosphate of calcium, are basic fertilizer material, and as such support an extensive producing industry. A world production of 11,760,000 metric tons in 1930 declined to 6,678,000 tons in 1932, and recovered to 12,025,000 tons in 1938. The United States is the leading producer, with 32% of the total, followed by Tunis 16%, the Soviet Union 15%, French Morocco 12%, Ocean and Nauru islands 10%, Algeria 5%, and Egypt 3%. These seven countries account for 93% of the total, and the remaining 7% is scattered among about 30 others. The general producing area in northern Africa, including Tunis, Morocco and Algeria, has not made any very material recovery from the depression drop. Although both Egypt and Ocean and Nauru islands suffered only a minor decline, and have recovered to a level well

above that of 1930, the Russian output is the only producer which has shown an exceptional growth, increasing steadily from 200,000 tons in 1930 to 1,791,000 tons in 1938. The United States output of 3,989,000 tons in 1930 dropped to 1,734,000 tons in 1932, and rose to 4,019,000 tons in 1937, about one-quarter of which was exported. In 1938 production declined to 3,799,000 tons, but exports increased to 30%. (See also FERTILIZERS.) (G. A. Ro.)

Photography. *General Photography.*—New films of higher speed and increased fineness of grain continue to be introduced. Many new cameras were announced, mostly in the smaller roll film and miniature sizes. In general, there was indication of a tendency to prefer the smaller roll film sizes to the miniature cameras. There was, however, an enormous increase in the use of colour film in miniature cameras. The manufacture of new shutters of precision type was started in the United States. Much attention has been paid to the possibility of increasing the transmission of lenses by treating the glass surfaces to reduce reflections. The interest in fine-grain development, very evident in recent years, declined somewhat, owing to the use of the newer films having high speed and fine grain. Interest in infra-red photography was reflected in the introduction of infra-red sensitive films in cut sheet and roll forms. A new camera was introduced in which a photoelectric cell was incorporated to control automatically the opening of the diaphragm in accordance with the brightness of the subject. A new precision enlarger of extreme flexibility was introduced on the American market. Several new types of flash lamp using foil and wire were introduced, and devices were produced whereby such lamps could be used with the simplest of amateur cameras. Flash lamps were rendered practically non-shatterable by coating with special varnish which, in some cases, included a dye to produce colour correction. Much interest was displayed in the new gaseous discharge lamps containing fluorescent material to fill in gaps in the spectra of the gases in the tube. These lamps showed some promise for broad front lighting, but their introduction in practice appears to be rather slow. The recent publication of patents on the new colour processes using coupler developers resulted in a revival of interest in the use of such developers for producing toned images, the purpose for which they were originally proposed. There was a steady increase in the use of photoelectric types of exposure meter, and meter ratings and speeds were published by one manufacturer for all his materials. An international meeting was held in Munich in June 1939 to discuss the standardization of the measurement and specification of the speed of photographic films. Much progress was made, and agreement on this much-discussed problem is in sight. The American Standards Association Sectional Committee on Photography formed many sub-committees which have started active work on standardization in numerous aspects of photography. The centenary of the discovery of photography by Daguerre was celebrated throughout the world in August, and attracted much public notice. The New York and San Francisco World's Fairs acted as a great stimulus to amateur photography.

Colour Photography.—Colour photography went ahead by leaps and bounds, particularly in the amateur field, but also for commercial illustration using Kodachrome in cut sheet form. An important innovation by the Eastman Kodak Company was a service for supplying duplicates of Kodachrome pictures to the same size as the original and enlarged or reduced, as well as duplicates of 16-mm. motion picture films in colour. Three-colour one-exposure cameras continued to be used for making colour separation negatives for commercial print making by the Carbro and Wash-off Relief processes, and a number of new cameras were introduced. Kodachrome pictures made in miniature cameras were returned from processing ready mounted in the form of

2"x2" slides. This gave a great impetus to the use of such slides for visual education and home projection, and was accompanied by the introduction of cheap models of slide projectors. Colour photography requires that the lamps used in the studio be of the correctly controlled colour, and special incandescent tungsten filament lamps were increasingly used, operating at the colour temperature of 3,200° K., for which cut sheet Kodachrome is balanced. Flash lamps and studio lamps were also made with specially selected blue coatings to permit of their being mixed with daylight for colour photography, and blue glass filters were used over studio lamps to be mixed with arc lights and sunlight. The Eastman Color Temperature Meter was much used for controlling the quality of illumination, in conjunction with special compensating filters. In Europe, colour photography was still carried out almost exclusively by the amateur, using the Kodachrome, Agfacolor-Neu and Dufaycolor processes. In Germany, Agfa demonstrated the Pantochrome process for colour motion picture films, using a lenticular bipack in the camera, and printing on to multicoated "Tripofilm" using the silver-dye bleaching process. Agfa also demonstrated colour films made by the colour negative-positive process. In the United States, the number of films made by the Technicolor process increased. In July 1939 there were nine colour feature films in production, the most under way in any single month, and there was a marked increase in quality. At the Hall of Color in the Kodak building at the New York World's Fair, there were projected changing series of 11 Kodachromes made in miniature cameras, using a continuous screen 22ft. by 187 feet. Special automatic projectors were designed for this unprecedented feat, particular attention being paid to screen illumination, film cooling and accurate registration of adjacent pictures.

Motion Picture Photography.—The industry adopted for studio use the new types of film introduced in the previous year. The extremely fast films extended the possibilities of news-reel work, while for studio operation the films of medium speed were mainly used. Fine-grain duplicating films permitted the preparation of duplicate negatives and positives of improved quality. Improvements were made in incandescent lighting equipment and arcs, and the new fluorescent gaseous discharge lamps were studied for studio use. There was no startling innovation in sound recording, but a steady improvement of quality. Television has not yet reached a stage where it is a serious competitor for the motion picture. Motion picture films were used daily as part of the television programs broadcast by R.C.A. in New York, and the Columbia Broadcasting Company announced a new method of scanning motion pictures for television purposes. A demonstration was given to show the improvement in the viewing of a projected picture obtained by surrounding the screen with an illuminated border of medium brightness. (See also under *Colour Photography*.)

Applications.—Photography continued to serve as a very important tool in the fields of scientific and technical investigation and record, and for education. Colour was increasingly used, particularly in the biological applications, and for illustrating lectures. The great progress in astronomy which has occurred in recent years largely as a result of the introduction of specially sensitized films and plates, was continued, particularly with plates of very high red speed. Through the use of infra-red sensitive materials, new dark stars have been discovered, and the presence of infra-red radiation in space detected. Within six weeks after the 82in. reflector had been put in operation in the new MacDonald Observatory at Mt. Locke, Tex., two new super-heavy stars were discovered. Under the auspices of the National Geographic Society, a program of photography of the aurora was started, and many records were made in both black-and-white and

colour. High speed photography using the technique developed by Edgerton found many applications in science and industry. By lowering a tiny camera, calibrated scale and compass into oil wells, drillers have developed a way of determining the alignment of the wells underground, and in one case the method has been used to produce deliberate departure from the vertical. In the educational field, there is a slight increase in the use of sub-standard motion pictures, although the interest is not so great in the United States as it is in Europe. There is a great increase in the use of projectors using 2in. square slides, partly due to the new practice of returning Kodachromes from processing ready mounted for projection, and partly to the availability of cheap projectors and simple means for the photographer to mount his own transparencies. In the photomechanical field, there is a marked increase in the use of colour.

Stripping film and process film of high contrast type have almost entirely replaced the wet plate in photolithography, and to a lesser extent in photo-engraving. There was some interest in the use of ultra-violet photography to facilitate production of high-light screen negatives and exaggerate contrast. Police departments showed a greater interest in the use of photography in crime detection.

The illustrated newspapers and magazines gave evidence of the steadily increasing use of photography for news reporting. One of the outstanding news events of 1939, the visit of the King and Queen of England to Canada and the United States in May and June, was very extensively covered, and the war in Europe provided much in the way of propaganda and news pictures. These were subject to censorship by the nations concerned, but a fair

number were transmitted by radio to New York. The possibilities of press photography were extended by the newly introduced fast films, and by the use of telephoto lenses of very long equivalent focus.

There was much activity in aerial photography during 1939, and it was accelerated by the war in Europe, particularly for reconnaissance purposes. There has been some interest in the use of small cameras for aerial work. The necessity for flying high led to the use of normal aerial cameras fitted with telephoto lenses, and using infra-red and extreme red sensitive films for haze penetration. Colour photography and infra-red photography were studied for their possible use in camouflage detection, and flashlight photography for night work. The Fairchild Camera Corporation made a new camera taking the largest single negative yet used in aerial photography. The picture is 18in. square, and the lens of aperture $f/6.8$ and 12in. focal length. The roll of film accommodates 600 exposures. In England, a 7-lens aerial camera was produced under the direction of the Air Survey Committee. There was a trend towards the use of cameras provided with short focus, wide angle lenses, covering more terrain on a single negative, and so saving flying time and film. The large United States aerial survey for crop and erosion studies and mapping was continued. There was much use of gun cameras and motion pictures for military training purposes.
